The atomic modeling of soft X-ray laser schemes presents a formidable challenge to the theorists - a challenge magnified by the recent successful experiments. A complex plasma environment with many ion species present must be simulated. Effects such as turbulence, time dependence, and radiation transport, which are very difficult to model accurately, may be important. We shall describe our efforts to model the recently demonstrated soft X-ray laser in collisionally pumped neon-like selenium, with emphasis on the ionization balance and excited state kinetics. The relative importance of various atomic processes, such as collisional excitation and dielectronic recombination, on the inversion kinetics will be demonstrated. We shall compare our models with experimental results and evaluate the success of this technique in predicting and analyzing the results of X-ray laser experiments. DOE

LASER IGNITION STUDIES
L. Fredin, G. P. Hansen, J. L. Margrave, and R. G. Behrens Oct. 1985 9 p Presented at the DARPA/ARMY Symposium, Daytona Beach, Fla., 21 Oct. 1985 Prepared in cooperation with Los Alamos National Lab., N. Mex.
(Contract W-7405-eng-36)
(DE86-006043; LA-UR-86-383; CONF-8510280-5) Avail: NTIS HC A02/MF A01

The goal of this work is to study the details of laser induced ignition and combustion of high-temperature condensed-phase exothermic reactions. In this work high-speed photography (HSP) and real-time optical pyrometry have been combined to provide a diagnostic tool with a 1 ms temporal resolution for studying laser ignition and combustion wave propagation. Previous experiments have involved the use of HSP for studying combustion wave propagation (1) Real-time pyrometry studies of the ignition process have also been performed previously. The present paper describes how HSP has been expanded to include three-view split-frame photography to allow the ignition and combustion processes to be recorded and studied simultaneously. DOE

LASER INDUCED OXIDATION OF HEAVILY DOPED SILICON
E. Fogarassy (Centre de Recherches Nucleaires, Strasbourg (France).), C. W. White, D. H. Lowndes, and J. Narayan 1985 7 p Presented at the Symposium on Phase Transitions in Condensed Systems: Experiments and Theory, Pittsburgh, Pa., 2 Dec. 1985 Prepared in cooperation with Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires.
(Contract DE-AC05-84OR-21400)
(DE86-006212; CONF-851260-2) Avail: NTIS HC A02/MF A01

We have investigated the incorporation of oxygen into heavily doped silicon during uv excimer laser irradiation. For the case of repetitive laser irradiations in air, the amount of oxygen incorporated into Si depends markedly on the dopant. For As and Sb implanted silicon, there is no anomalous oxygen incorporation. By contrast, increasing amounts of O are incorporated into In implanted silicon as a function of number of laser shots. The incorporation of O is associated with degradation of the optical and structural properties of the surface, and a deep diffusion of the dopant. This behavior is believed to be partly related to specific chemical reactions between oxygen and indium present in the surface at high concentrations as the result of dopant segregation during solidification. CHARACTERIZATION OF HIGH POWER FLASHLAMPS AND APPLICATION TO Nd:GLASS LASER PUMPING
H. T. Powell, A. C. Erlandson, and K. S. Jancaitis 17 Jan. 1986 58 p Presented at the Los Angeles Symposium and Exhibition on Optical and Electro-Optical Engineering, Los Angeles, Calif., 19 Jan. 1986
(Contract W-7405-eng-48)
(DE86-007116; UCRL-94147; CONF-860117-5) Avail: NTIS HC A04/MF A01

Detailed spectral and temporal measurements of the output radiation from Xe flashlamps are reported together with their use in predicting the pumping efficiency of Nd-doped laser glass. We have made absolute spectral-intensity measurements for 0.5, 1.5, and 4.2-cm-bore flashlamps for input powers ranging from 5 to 90 kW/cm(2) and pulselengths of 800 (MU)s. Under quasi-stationary conditions these flashlamps emit essentially identical spectra when excited at equal input power per unit-area of the bore. This behavior is characteristic of an optically-thick radiator although it is not completely clear why flashlamps should behave this way. A simple model is also described which accounts for the transient response of flashlamps by characterizing the output spectra and radiation efficiencies in terms of the radiant output power rather than the electrical input power. NUMERICAL SIMULATION OF GAIN-GUIDED DIODE LASER ARRAYS
G. R. Hadley 1986 10 p Presented at the SPIE Technical Symposium on Applications of Artificial Intelligence, Orlando, Fla., 31 Mar. 1986
(Contract DE-AC04-76DP-00789)
(DE86-007833; SAND-86-0490C; CONF-860366-2) Avail: NTIS HC A02/MF A01

We present a self-consistent numerical model of light propagation in diode laser arrays. This model has been used to study the free-running modes of a five-element gain-guided array operated just below threshold. The resulting calculations show that, in contrast to index-guided arrays, the modeshapes in general bear little or no resemblance to the "supermodes" obtained previously from linear perturbation theories. In addition, we find more than 5 modes for an 5-element device, so that the intensity maxima in the near-field are not necessarily centered over the stripes. These observations are explainable in terms of a simple plane wave model of the array cavity. DOE

HC A04/MF A01

This volume of the LLE Review comprises reports on the performance of the active-mirror-boosted glass development laser (GDL) single-beam system; the implementation of multichannel, soft x-ray diagnostic instrumentation; computer simulation of recent OMEGA laser implosion experiments; materials and ultrafast technology developments in the LLE advanced technology program; and the the National Laser Users Facility activities for October-December 1985. The following are some highlights of the work described in this issue: (1) The active-mirror booster stage on GDL brings single-beam, 1054-nm output energy near the kilojoule level for 1-ns pulses. (2) Measurements of soft x-ray emission from 100 to 200 eV are now possible with the help of a four-channel, GHz-bandwidth diode spectrometer, which is fully integrated into a digital data acquisition system. (3) Comparison of experimental data and predictions of one-dimensional numerical simulations of OMEGA implosion experiments reveal discrepancies that can be resolved to two-dimensional calculations. (4) The technique ofpulse chirping allows temporal stretching and recompression operations to be carried out in picosecond pulses, to amplify pulses in compact systems and avoid the dangers of optical nonlinearities due to high peak powers. (5) High-average-power glass lasers require glasses with improved thermal-shock resistance. Recent gains in ion-exchange surface treatments of a phosphate-composition glass have led to a fivefold increase in thermal-shock resistance for that glass. DOE

(Contract DE-FG02-85ER-13421)
(DE86-008513; DOE/ER-13421/1) Avail: NTIS HC A02/MF A01

We have proceeded with analysis and publication of data obtained using the double optical resonance technique to study the effects of phase fluctuations in saturated absorption in a 3s-3p transition in atomic sodium. We have initiated development of techniques for observing the effects of fluctuations in resonance fluorescence radiation in the same transition, using optical heterodyning. We have investigated the possibilities for carrying out studies on a partially saturated two-photon transition in molecular sodium. The major effort has been concentrated on development and application of a technique for investigating the role of amplitude fluctuations on two-photon Doppler free absorption in the 3s-5s transition in atomic sodium. In addition, a brief collaboration with scientists from other universities addresses the question of the role of fluctuations in Hanle effect measurements. DOE

INSTABILITY ANALYSIS PROCEDURE FOR 3-LEVEL MULTI-BEARING ROTOR-FOUNDATION SYSTEMS
Shixiang Zhou and Neville F. Rieger *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 15-36 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

A procedure for the instability analysis of a three-level multispan rotor systems is described. This procedure is based on a distributed mass elastic representation of the rotor system in several eight-coefficient bearings. Each bearing is supported from an elastic foundation on damped, elastic pedestals. The foundation is represented as a general distributed mass elastic structure on discrete supports, which may have different stiffness and damping properties in the horizontal and vertical directions. This system model is suited to studies of instability threshold conditions for multirotor turbomachines on either massive or flexible foundations. The instability conditions is found by obtaining the eigenvalues of the system determinant, which is obtained by the transfer matrix method from the three-level system model. The stability determinant is solved for the lowest rotational speed at which the system damping becomes zero in the complex eigenvalue, and for the whirl frequency corresponding to the natural frequency of the unstable mode. An efficient algorithm for achieving this is described. Application of this procedure to a rigid rotor in two damped-elastic bearings and flexible supports is described. A second example discusses a flexible rotor with four damped-elastic bearings. The third case compares the stability of a six-bearing 300 Mw turbine generator unit, using two different bearing types. These applications validate the computer program and various aspects of the analysis. Author

SIMULATION OF NON-LINEAR BEARING FORCES FOR POST-STABILITY INVESTIGATION
Z. A. Parszewski, J. M. Krodiewski, K. Krynicki, and A. E. Salek *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 37-46 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

Different types of bearing designs were developed to improve dynamic properties of rotor-bearing systems. Elliptical bearings, multisleeve bearings, tilting pad and other designs such as herringbone groove were utilized to increase resistance to the onset of self excited vibrations. Experimental trials are costly, two alternative methods are used to gain a qualitative insight. The first one creates mathematical model and applies both a digital or an analog computer simulation. The second one investigates phenomena occurring on the laboratory rig with the bearing replaced by an electronic simulating device, working in a feedback loop, which produces forces,which are functions of journal displacement and velocity. The simulated hydrodynamic forces are produced according to assumed characteristics matched to the bearing type. The principal benefit of the analog simulation is that nonlinear characteristics of a subsystem are precisely identified and mathematical methods applied for a wide class of problems are checked on the experimental installation. WHY HAVE HYDROSTATIC BEARINGS BEEN AVOIDED AS A STABILIZING ELEMENT FOR ROTATING MACHINES
Donald E. Bently and Agnes Muszynska *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 59-64 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

The advantages are discussed of hydrostatic, high pressure bearings as providers of higher margin of stability to the rotor/bearing systems. It is apparent that deliberate use of hydrostatic bearing high pressure lubricated (any gas or liquid) can easily be used to build higher stability margin into rotating machinery, in spite of the thirty years bias against high pressure lubrication. Since this supply pressure is controllable (the Direct Dynamic Stiffness at lower eccentricity is also controllable) so that within some rotor system limits, the stability margin and dynamic response of the rotor system is more readily controllable. It may be possible to take advantage of this effect in the various seals, as well as the bearings, to assist with stability margin and dynamic response of rotating machinery. The stability of the bearing can be additionally improved by taking advantage of the anti-swirling concept. The high pressure fluid supply inlets should be located tangentially at the bearing circumference and directed against rotation. The incoming fluid flow creates stability by reducing the swirling rate. E.R.

TWO-PHASE FLOWS WITHIN SYSTEMS WITH AMBIENT PRESSURE
R. C. Hendricks, M. J. Braun (Akron Univ., Ohio.), R. L. Wheeler, III, and R. L. Mullen (Case Western Reserve Univ., Cleveland, Ohio.) *In its* Instability in Rotating Machinery (date) p 83-96 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

In systems where the design inlet and outlet pressures are maintained above the thermodynamic critical pressure, it is often assumed that two phase flows within the system cannot occur. Designers rely on this simple rule of thumb to circumvent problems associated with a highly compressible two phase flow occurring within the supercritical pressure system along with the uncertainties in rotordynamics, load capacity, heat transfer, fluid mechanics, and thermophysical property variations. The simple rule of thumb is adequate in many low power designs but is inadequate for high performance turbomachines and linear systems, where two phase regions can exist even though outlet pressure is greater than critical pressure. Rotordynamic-fluid-mechanic restoring forces depend on momentum differences, and those for a two phase zone can differ significantly from those for a single-phase zone. Using the Reynolds equation the angular velocity, eccentricity, geometry, and ambient conditions are varied to determine the point of two phase flow incipience. Author

EXPERIMENTAL VERIFICATION AND PRACTICAL APPLICATION OF TORQUEWHIRL THEORY OF ROTORDYNAMIC INSTABILITY
J. M. Vance, S. T. Noah, and K. B. Yim (Sundstrand Corp., Rockford, Ill.) *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 107-123 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

A theory developed by Vance in 1978 to explain the destabilizing effect of torque on a whirling rotor was experimentally verified. The measurements made on a specially designed test apparatus are described. New computer models were also developed to investigate the effect of torque on rotordynamic stability of multidisk flexible rotor bearing systems. The effect of torque was found to be most pronounced when the system is already marginally stable from other influences. The modifications required to include torque in a typical shaft transfer matrix are described, and results are shown which identify the type of rotor design most sensitive to load torque. Author

CO2 COMPRESSOR VIBRATION AND CAUSE ANALYSIS
Yin Lin Ying *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 125-133 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

The operational experience of a large turbine drive carbon dioxide compressor train in a urea plant with capacity of 1620 tons/day is considered. After the initial start-up in 1976, the vibration in the HP cylinder was comparatively serious. The radial vibration reached 4.2 to 4.5 mils and fluctuated around this value. It was attributed to the rotating stall based on the spectrum analysis. Additional return line from the 4th to 4th and higher temperature of the 4th inlet has cured the vibration. Problems are described which were encountered in the operation along with their solutions, and/or improvements. Author

INFLUENCE OF DESIGN PARAMETERS ON OCCURENCE OF OIL WHIRL
Peter J. Ogrodnik, Michael J. Goodwin, and John E. T. Penny (Aston Univ., Birmingham England) *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 135-144 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

Oil whirl instability is a serious problem in oil lubricated journal bearings. The phenomenon is characterized by a subsynchronous vibration of the journal within the bush and is particularly apparent in turbogenerators, aeroengines and electric motors. A review is presented of previous papers on the subject of oil whirl, and a simple theory is described which was used to aid the design of

an oil whirl test rig. Predictions of the onset of oil whirl made by the theory presented were found to agree with those of previous researchers. They showed that increasing the shaft flexibility, or the lubricant viscosity, and decreasing the bearing radial clearance tended to reduce the oil whirl onset speed thus making the system more unstable. WHIRL AND WHIP: ROTOR/BEARING STABILITY PROBLEMS
Agnes Muszynska *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 155-177 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

A mathematical model of a symmetric rotor supported by one rigid and one fluid lubricated bearing is proposed. The rotor model is represented by generalized (modal) parameters of its first bending mode. The rotational character of the bearing fluid force is taken into account. The model yields synchronous vibrations due to rotor unbalance as a particular solution of the equations of motion, rotor/bearing system natural frequencies and corresponding self-excited vibrations known as oil whirl and oil whip. The stability analysis yields rotative speed threshold of stability. The model also gives the evaluation of stability of the rotor synchronous vibrations. In the first balance resonance speed region two more thresholds of stability are yielded. The width of this stability region is directly related to the amount of rotor unbalance. The results of the analysis based on this model stand with very good agreement with field observations of rotor dynamic behavior and the experimental results. Author

SOME NEW RESULTS CONCERNING THE DYNAMIC BEHAVIOR OF ANNULAR TURBULENT SEALS
H. Massmann and R. Nordmann *In* NASA. Lewis Research center Instability in Rotating Machinery Dec. 1985 p 179-194 Sponsored in part by Deutsche Forschungsgemeinschaft, West Germany (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

The dynamic characteristics of annular turbulent seals applied in high pressure turbopumps can be described by stiffness, damping, and inertia coefficients. An improved procedure is presented for determining these parameters by using measurements made with newly developed test equipment. The dynamic system seal, consisting of the fluid between the cylindrical surfaces of the rotating shaft and the housing, is excited by test forces (input), and the relative motion between the surfaces (output) is measured. Transformation of the input and output time signals into the frequency domain leads to frequency response functions. An analytical model, depending on the seal parameters, is fitted to the measured data in order to identify the dynamic coefficients. Some new results are reported that show the dependencies of these coefficients with respect to the axial and radial Reynolds numbers and the geometrical data of the seal. Author

One example of excessive vibration encountered during loading of a centrifugal compressor train (H type compressor with HP casing) is discussed. An investigation was made of the effects of the dynamic load on the bearing stiffness and the rotor-bearing system critical speed. The high vibration occurred at a 'threshold load,' but the machine didn't run smoothly due to rubs even when it had passed through the threshold load. The acquisition and discussion of the data taken in the field as well as a description of the case history which utilizes background information to identify the malfunction conditions is presented. The analysis shows that the failures, including full reverse precession rub and exact one half subharmonic vibration, were caused by the oversize bearings and displacement of the rotor center due to foundation deformation and misalignment between gear shafts, etc. The corrective actions taken to alleviate excessive vibration and the problems which remain to be solved are also presented. CRACKED SHAFT DETECTION ON LARGE VERTICAL NUCLEAR REACTOR COOLANT PUMP
L. Stanley Jenkins *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 253-265 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

Due to difficulty and radiation exposure associated with examination of the internals of large commercial nuclear reactor coolant pumps, it is necessary to be able to diagnose the cause of an excessive vibration problem quickly without resorting to extensive trial and error efforts. Consequently, it is necessary to make maximum use of all available data to develop a consistent theory which locates the problem area in the machine. This type of approach was taken at Three Mile Island, Unit #1, in February 1984 to identify and locate the cause of a continuously climbing vibration level of the pump shaft. The data gathered necessitated some in-depth knowledge of the pump internals to provide proper interpretation and avoid misleading conclusions. Therefore, the raw data included more than just the vibration characteristics. Pertinent details of the data gathered is shown and is necessary and sufficient to show that the cause of the observed vibration problem could logically only be a cracked pump shaft in the shaft overhang below the pump bearing. Rotor dynamic behavior of high energy centrifugal pumps is significantly affected by two types of fluid forces; one due to the hydraulic interaction of the impeller with the surrounding volute or diffuser and the other due to the effect of the wear rings. The available data on these forces is first reviewed. A simple one degree-of-freedom system containing these forces is analytically solved to exhibit the rotor dynamic effects. To illustrate the relative magnitude of these phenomena, an example of a multistage boiler feed pump is worked out. It is shown that the wear ring effects tend to suppress critical speed and postpone instability onset. But the volute-impeller forces tend to lower the critical speed and the instability onset speed. However, for typical boiler feed pumps under normal running clearances, the wear ring effects are much more significant than the destabilizing hydraulic interaction effects. Author

The effect of a nonuniform flow field on the Alford force calculation is investigated. The ideas used here are based on those developed by Horlock and Greitzer. It is shown that the nonuniformity of the flow field does contribute to the Alford force calculation. An attempt is also made to include the effect of whirl speed. The values predicted by the model are compared with those obtained experimentally by Urlicks and Wohlrab. The possibility of using existing turbine tip loss correlations to predict beta is also exploited. The nonuniform flow field induced by the tip clearnance variation tends to increase the resultant destabilizing force over and above what would be predicted on the basis of the local variation of efficiency. On the one hand, the pressure force due to the nonuniform inlet and exit pressure also plays a part even for unshrouded blades, and this counteracts the flow field effects, so that the simple Alford prediction remains a reasonable approximation. Once the efficiency variation with clearance is known, the presented model gives a slightly overpredicted, but reasonably accurate destabilizing force. In the absence of efficiency vs. clearance data, an empirical tip loss coefficient can be used to give a reasonable prediction of destabilizing force. To a first approximation, the whirl does have a damping effect, but only of small magnitude, and thus it can be ignored for some purposes. E.R.

Two aspects of internal friction affecting stability of rotating machines are discussed. The first role of internal friction consists of decreasing the level of effective damping during rotor subsynchronous and backward precessional vibrations caused by some other instability mechanisms. The second role of internal frication consists of creating rotor instability, i.e., causing self-excited subsynchronous vibrations. Experimental test results document both of these aspects. Author

Avail: NTIS HC A21/MF A01 CSCL 13I

In two of Agrico's three plants, instabilities in the rotor/bearing system have been an ongoing problem. On occasion plant rates, i.e., machine speed, have been restricted in order to limit the exhaust and shaft relative vibration on the 103-JAT to a maximum value of 89 micrometer (0.0035) peak to peak. The purpose is to acquaint one with Agrico's experiences with exhaust end vibration and rotor instabilities on the 103-JAT topping turbine. The final conclusions arrived at were based on: (1) field acquired data both during steady state and transient conditions; (2) computer modeling of the rotor/bearing system; and (3) vibration data taken from a control rotor during a series of test runs in a high speed balancing machine from 0 to 110% of operating speed. HYDRAULIC INDUCED INSTABILITY ON A VERTICAL SERVICE
R. F. Bosmans *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 361-368 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

The case history contained provides insight toward the mechanical and hydraulic behavior of a vertical pump. It clearly demonstrates the need for measurements on the rotor at or near the impeller area. The results are reported of an analysis on a service water pump. This pump is typical of the water pumps used throughout the power generation industry. Although little is known of the mechanical behavior of vertical pumps because of difficulty in modeling the rotor system, recent developments in the application of submersible proximity transducers have made possible the measurement of pump dynamics under operating conditions. The purpose of this study was to determine the proper selection and installation of vibration-monitoring transducers as well as to measure the effects of imbalance, misalignment, and hydraulics on the performance and reliability of vertical pumps. In addition, the cause of shaft failures on this pump was to be determined. Author

The identification, diagnosis, and final correction of complex machinery malfunctions typically require the correlation of many parameters such as mechanical construction, process influence, maintenance history, and vibration response characteristics. The progression is reviewed of field testing, diagnosis, and final correction of a specific machinery instability problem. The case history presented addresses a unique low frequency instability problem on a high pressure barrel compressor. The malfunction was eventually diagnosed as a fluidic mechanism that manifested as an aerodynamic disturbance to the rotor assembly. Author

REMARKS ON ROTOR STABILITY (A CONTRIBUTION TO DISCUSSICN DURING SYMPOSIUM ON INSTABILITY IN ROTATING MACHINERY)
E. Kraemer *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 379-383 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

Influence of nonlinear factors in fluid lubricated bearings on rotor vibrations is discussed as are computation of threshold of stability for systems with multiple degrees of freedom. The reason for this investigation was to learn more about the influence of tilting pad bearings on vertical rotors. The eigenvalues, the stability threshold, the response on the Heaviside-function and the unbalance response were calculated for a rigid rotor, a Jeffcott rotor and for the finite element model of a real rotor. The comparison of the linear and nonlinear calculations shows the limit of the linear calculations. The computation is supposed to show, that the model of the Jeffcott rotor is not sufficient in most practical cases to determine the stability threshold. This was known for some years, when computed results were compared with the behavior of real machines. That's why a program was developed, which is roughly described. E.R.

The influence of bearing misalignment upon the dynamic characteristics of statistically indeterminant rotor bearing systems is investigated. Both bearing loads and stability speed limits of a rotor may be changed significantly by magnitude and direction of bearing misalignment. The useful theory of short journal bearings is introduced and simple analytical expressions, governing the misalignment problem, are carried out. Polar plots for the bearing load capacities and stability maps, describing the speed limit in terms of misalignment, are presented. These plots can be used by the designer to estimate deviations between calculation and experimental data due to misalignment effects. Author

The operation of rotor rigs used to demonstrate various instability phenomena occurring in rotating machines is described. The instability phenomena demonstrated included oil whirl/whip antiswirl, rub, loose rotating parts, water-lubricated bearing instabilities, and cracked shaft. The rotor rigs were also used to show corrective measures for preventing instabilities. Vibrational response data from the rigs were taken with modern, computerized instrumentation. The rotor nonsynchronous perturbation rig demonstrated modal identification techniques for rotor/bearing systems. Computer-aided data acquisition and presentation, using the dynamic stiffness method, makes it possible to identify rotor and bearing parameters for low modes. The shaft mode demonstrator presented the amplified modal shape line of the shaft excited by inertia forces of unbalance (synchronous perturbation). The first three bending modes of the shaft can be demonstrated. The user-friendly software, Orbits, presented a simulation of rotor precessional motion that is characteristic of various instability phenomena. The data presentation demonstration used data measured on a turbine driven compressor train as an example of how computer aided data acquisition and presentation assists in identifying rotating machine malfunctions. WHIRL/WHIP DEMONSTRATION
Robert Grissom *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 415-422 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

Fluid flow in bearings and seals, set in motion by shaft rotation, generates dynamic forces which may result in a well recognized instability known as whirl and whip. These are lateral, forward precessional, self excited, subsynchronous vibrations in which the amplitude may vary from very small to nearly the limit of the bearing or seal clearances. Oil whirl in lubricated bearings, in particular, typically occurs at somewhat less than half rotative speed. As the rotative speed increases, the frequency relationship remains constant until the whirl frequency approaches the first balance resonance. Now the whirl is smoothly replaced by whip at a nearly constant frequency asymptotically approaching first balance resonance, independent of increasing rotative speed. Changes in bearing/seal radial loading can permit, prevent, or eliminate this instability. The oil whirl/whip rig demonstrates the effects of fluid dynamic forces generated by the rotating shaft. At low rotative speeds, this produces changes of the journal static equilibrium position within the bearing. The demonstrator shows the relationship between any load direction and the average journal equilibrium position. At higher rotative speeds, the instability threshold is observed as a function of unidirectional radial load, unbalance, and rotor configuration. Author

ANTI-SWIRLING DEMONSTRATION
Agnes Muszynska *In* NASA. Lewis Research Center Instability in Rotating Maching Dec. 1985 p 423-426 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

Fluid in bearings and seals, involved in motion due to shaft rotation and generating fluid dynamic forces, represents the well recognized source of instability known as whirl and whip. It is characterized by shaft forward circular precession at subysnchronous frequency. Control of the flow pattern in the bearing/seal clearance may enhance the stability. The rotor system demonstrates the dynamic effect of perturbation of the flow pattern in a seal gap by blowing compressed air in the rotor tangential direction. This effect results in shifting the rotor threshold of stability to a higher value of rotative speed when the air jet direction opposes rotation, and to a lower value of rotative speed when the air jet direction coincides with rotation. This effect implies that an unstable rotor can be stabilized by blowing air in the direction opposite to rotation. This technique is known as anti-swirl. Author

PARTIAL ROTOR-TO-STATOR RUB DEMONSTRATION
Robert Grissom *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 427-430 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

A rotor radial rub typically occurs in seals or at a blade tip or shroud when there is insufficient clearance, high vibration, or the shaft equilibrium position has been displaced to effectively limit the clearance (eccentricity). There are two extreme cases of radial rubs: full annular rub, when the rotor maintains continuous contact with the seal, etc.; and a partial rub, when the contact occurs during a fraction of the precession period. They both involve similar physical phenomena such as friction and modification of stiffness. In partial rubs with consecutive impacts, a significant average value of radial force is generated. This results in shaft average displacement in the direction opposite the rub location. The rotor rig demonstrates the characteristics of a partial lateral rub of varying severity and location. These characteristics include: (1) subharmonic components as a function of rotative speed/first balance resonance ratio and radial force; (2) higher harmonic content as a function of severity; (3) increased average rotor stiffness resulting in increased first balance resonance speed; and (4) change in overall orbital pattern as a sum of the unbalance response (1x) and subharmonic response (1nx). ROTOR INSTABILITY DUE TO LOOSE ROTATING PART
Agnes Muszynska *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 431-437 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

Loosening of a rotating part from its fixed position on the shaft or a part of the stator which comes loose and begins to turn with the rotor very frequently represents machinery malfunction. The loose part becomes involved in rotative motion mostly due to dry or fluid friction, and thus its motion is very erratic. The loose part can also move axially along the shaft. Detachment of the rotating part causes changes in the rotor balance state. Most often this results in higher unbalance. During steady-state operation the effect of a loose rotating part can manifest itself through heat vibration. It can be diagnosed by observing periodic changes of amplitude and phase of the synchronous response. During start-up (or shutdown) a loose rotating part carrying some amount of unbalance may manifest its dynamic action in the form of subsynchronous vibrations, very similar to those of other instabilities. The objective of this demonstration is to observe the effect of a loose rotating part (fixed, however, in the axial direction) under both steady-state (rotor constant speed) and transient (rotor start-up or shutdown) operation. The dynamic response depends very much on the amount of damping in the system: lubrication of the loose part/shaft surfaces and addition/elimination of aerodynamic drag blades, mounted on the loose disk, significantly change the rotor response. Author

INSTABILITY IN HYDRAULIC MACHINES DEMONSTRATION RIG
Agnes Muszynska and M. J. Braun (Akron Univ., Ohio.) *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 439-442 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

In fluid flow machines, the working fluid involved in rotative motion due to shaft rotation significantly modifies the rotor synchronous response. This can result in the rotor maintaining the high vibration amplitude that occurs at resonance over an extended rotative speed range. The phase changes in this range are typically very small. The fluid may also create rotor instability,

i.e., subsynchronous self-excited vibrations, when the rotative speed is sufficiently high. This rotor instability is often related and increases with higher rotor unbalance (Opposite to other types of instability such as oil whirl/whip, internal friction, etc.). The rotor rig demonstrates typical dynamic behavior of hydraulic machines. At lower speeds the effect of amplitude/phase mentioned above is noticeable; at higher speeds the subsynchronous instability occurs. Author

Sweep perturbation testing as used in Modal Analysis when applied to a rotating machine has to take into consideration the machine dynamic state of equilibrium at its operational rotative speed. This stands in contrasts to a static equilibrium of nonrotating structures. The rotational energy has a significant influence on rotor dynamic characteristics. The best perturbing input for rotating machines is a forward or reverse rotating, circular force applied directly to the shaft. Determination of Dynamic Stiffness Characteristics of the rotor bearing system by nonsynchronous perturbation of a symmetric rotating shaft supported in one relatively rigid and one oil lubricated bearing. SHAFT MODE SHAPE DEMONSTRATION
Robert Grissom *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 457-458 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

The dynamic response of a rotating machine is directly influenced by its geometric configuration and all aspects of the rotor construction. These determine two significant parameters, mass distribution and stiffness, which yield a spectrum of natural frequencies and mode shapes. The mode shapes can be presented as snapshots of the characteristic amplitude/phase reponse patterns of the shaft, due to the major forcing function of unbalance, at different rotative speeds. To demonstrate the three shaft mode shapes of the rotor rig using the Shaft Mode Demonstrator and oscilloscopes. The synchronous (1X) amplitude and phase of the rotor vibration in the vertical direction from several points along the shaft is displayed on corresponding points of the demonstrator. Unfiltered vibration from vertical and horizontal probe pairs is displayed on the oscilloscopes in orbit format for a dynamic presentation of the mode shape. Author

Avail: NTIS HC A21/MF A01 CSCL 13I

In rotating machinery dynamics an orbit (Lissajous curve) represents the dynamic path of the shaft centerline motion during shaft rotation and resulting precession. The orbit can be observed with an oscilloscope connected to XY promixity probes. The orbits can also be simulated by a computer. The software for HP computer simulates orbits for two cases: (1) Symmetric orbit with four frequency components with different radial amplitudes and relative phase angles; and (2) Nonsymmetric orbit with two frequency components with two different vertical/horizontal amplitudes and two different relative phase angles. Each orbit carries a Keyphasor mark (one-per-turn reference). The frequencies, amplitudes, and phase angles, as well as number of time steps for orbit computation, have to be chosen and introduced to the computer by the user. The orbit graphs can be observed on the computer screen. Author

DATA PRESENTATION TECHNIQUES FOR ROTATING MACHINERY MALFUNCTION DIAGNOSIS
Thomas Spettel *In* NASA. Lewis Research Center Instability in Rotating Machinery Dec. 1985 p 465-468 (For primary document see N86-30160 21-37)
Avail: NTIS HC A21/MF A01 CSCL 13I

Baseline steady state data is excellent for documentation of vibration signals at normal operating conditions. Assuming that a set of initial data was acquired with the machinery in a good state of repair, any future changes or deterioration in mechanical condition can be easily compared to the baseline information. Often this type of comparison will yield sufficient information for evaluation of the problem. However, many malfunctions require the analysis of transient data in order to identify the malfunction. Steady-state data formats consist of: Time Base Waveform, Orbit, Spectrum. Transient data formats consist of: Polar, Bode, Cascade. Our objective is to demonstrate the use of the above formats to diagnose a machine malfunction. A turbine-driven compressor train is chosen as an example. The machine train outline drawing is shown. (NASA-CR-176909; NAS 1.26:176909; SRS/STD-PR-535/21; Rept-5350) Avail: NTIS HC A02/MF A01 CSCL 13I

Integration of heat transfer coefficients, modified to account for local vapor quality, into the 45 mm bearing model has been completed. The model has been evaluated with two flow rates and subcooled and saturated coolant. The evaluation showed that by increasing the flow from 3.6 to 7.0 lbs/sec the average ball temperature was decreased by 102 F, using a coolant temperature of -230 F. The average ball temperature was decreased by 63 F by decreasing the inlet coolant temperature from saturated to -230 F at a flow rate of 7.0 lbs/sec. Since other factors such as friction, cage heating, etc., affect bearing temperatures, the above bearing temperature effects should be considered as trends and not absolute values. The two phase heat transfer modification has been installed in the 57 mm bearing model and the effects on bearing temperatures have been evaluated. The average ball temperature was decreased by 60 F by increasing the flow rate from 4.6 to 9.0 lbs/sec for the subcooled case. By decreasing the inlet coolant temperature from saturation to -24 F, the average ball temperature was decreased 57 F for a flow rate of 9.0 lbs/sec. The technique of relating the two phase heat transfer coefficient to local vapor quality will be applied to the tester model and compared with test data. Author

FEASIBILITY STUDY OF A DISCRETE BEARING/ROLLER DRIVE ROTARY JOINT FOR THE SPACE STATION
Stuart H. Loewenthal and Fredrick T. Schuller Jul. 1986 43 p

(NASA-TM-88800; E-3138; NAS 1.15:88800) Avail: NTIS HC A03/MF A01 CSCL 13I

The most critical mechanism on board the proposed space station is the continously rotating joint which must accurately align the solar power units with the sun during earth orbit. The feasibility of a multiple, discrete bearing supported joint driven by a self-loading, pinch drive actuator was investigated for this application. This concept appears to offer greater protection against catastrophic jamming, less sensitivity to adverse thermal gradients, greater accessibility to inorbit servicing or replacement and greater adaptability to very large (5 m) truss members than to more conventional continuous support bearing/gear reducer joints. Analytical trade studies performed herein establish that a discrete cam roller bearing support system having eight hangers around a continuous ring would provide sufficient radial and bending stiffness to prevent any degradation in the fundamental frequencies of the solar wing structure. Furthermore, it appears that the pinch roller drive mechanism can be readily sized to meet or exceed system performance and service life requirements. Wear life estimates based on experimental data for a steel roller coated with an advanced polyimide film show a continuous service life more than two orders of magnitude greater than required for this application. SUBMERGED ARC WELDING CONTROL VIA ARC SENSING
Final Report, 13 Sep. 1985 - 31 Jan. 1986
Milton D. Randall, George E. Cook, and Mark E. Shepard 31 Jan. 1986 178 p
(Contract N00014-85-C-0750)
(AD-A166320; CRCAW-0001AC) Avail: NTIS HC A09/MF A01 CSCL 13/8

The overall objective of this Phase I research was to establish the feasibility of using intelligence gleaned from the electrical arc signals of the submerged arc welding (SAW) process to adaptively control the position and geometry of the weld head relative to the weld joint. By so doing, it was expected that the weld joint could be tracked accurately and that proper fusion into the joint sidewall (and/or adjacent weld beads in a multipass per layer weld) and uniform fill could be adaptively maintained in real time. The limited research effort of the Phase I research program has shown that through-the-arc sensing and control methodology offers excellent promise for the SAW process. Indeed, the results achieved suggest that through-the-arc sensing will be potentially more powerful as a diagnostic and control tool for the SAW process than the other consumable electrode processes, where it has already met with high success. The results of this Phase I research indicates that the SAW process may prove to be the most applicable for through-the-arc methodologies. Therefore, additional Phase 2 research is necessary and very important and is strongly recommended. GRA

A VISCOELASTIC-DAMAGE SIMULATION MODEL FOR FILAMENT-WOUND PRESSURE VESSELS
Johnny L. Prater May 1985 67 p
(AD-A166389; AD-E950806; AMSMI/RL-85-4-TR) Avail: NTIS HC A04/MF A01 CSCL 13/4

A model to predict the viscoelastic/damage response of a filament-wound composite cylindrical pressure vessel to a proof-test loading is developed. The matrix material of the composite system is assumed to be isotropic and linearly viscoelastic. A damage model is proposed which produces a quadratic relationship between the transverse modulus and the circumferential strains. A nonlinear model results and is solved by iterative solution based on the damage response. The elastic-viscoelastic correspondence principle is used to produce, in the Laplace domain, an associated elastic solution for the circumferential strains. The associated elastic solution is inverted by using the method of collocation to yield the time-dependent circumferential strain. A numerical example to demonstrate the simulation model is included. A proof-test loading of 5.5 MPa is applied for one minute. Results indicate that the damage as modeled reduces the instantaneous failure load from 9.977 MPa to 7.771 MPa, or 22%. The creep that occurs during the constant load phase of the proof-test loading induces a 3.65% increase in the damage. After removal of the proof-test loading, the strain recovers to zero. However, the transverse modulus does not recover. This emphasizes the need to consider the effects of proof-test loading when the in-service load limits are determined. Author (GRA)

STEADY AND UNSTEADY AIR FLOW THROUGH AN INTAKE VALVE OF A RECIPROCATING ENGINE
A. F. Bicen, C. Vafidis, and J. H. Whitelaw 1986 9 p
(DE86-005208; DOE/NBM-6005208) Avail: NTIS HC A02/MF A01

An experimental investigation of the air flow through various axisymmetric intake ports of a reciprocating engine is reported. Detailed velocity field measurements obtained by laser Doppler anemometry and for steady and various unsteady flow conditions are presented together with valve discharge coefficients from steady flow tests. The results showed that the flow at the valve exit exhibited four regimes with a 45° seat angle compared to three in the case of a 60° valve. The overall behavior of the 45° valve, however, was found to be generally better. Rounding of the edges of the 45° valve reduced the number of flow regimes to two with marked improvements on discharge coefficient. The flow angle at the valve exit depended less on the flow regime and more on the cylinder confinement, in the absence of which the transition from one regime to another was delayed. The mean flow pattern at the valve exit was found to be insensitive to flow unsteadiness, piston confinement and valve operation and thus could be predicted with reasonable accuracy from steady flow tests. The in-cyclinder flow characteristics were also insensitive to valve operation, but strongly depended on piston interaction, flow unsteadiness and residual effects from the previous cycle. DOE

REPEATABILITY STUDY OF A 6-AXIS ROBOT
L. L. Brown Jan. 1986 26 p
(Contract DE-AC04-76DP-00613)
(DE86-006417; BDX-613-3342) Avail: NTIS HC A03/MF A01

Two tests were performed with a six-axis anthropomorphic type robot to evaluate its short-term repeatability and its drift characteristics. One test was taken with the robot mounted on a wood particle base plate; the second was taken with the robot mounted on a metal base plate. Once the robot was past an initial warm-up period, good repeatability characteristics with no significant drift were shown by the robot when it was mounted on a metal base plate. The robot mounted on the wood base plate showed significant drift from the predefined test point. DOE

A 1000 AMP AC/DC CURRENT SOURCE FOR THE CALIBRATION OF WELDING SYSTEMS
1986 9 p Presented at the IEEE Conference on Instrumentation and Measurements, Boulder, Colo., 25 Mar. 1986
(Contract DE-AC04-76DP-03533)
(DE86-004924; RFP-3872; CONF-860354-3) Avail: NTIS HC A02/MF A01

Calibration of welding systems and parameter monitoring data acquisition systems (DAS) assures transfer of identical welds between similar welders as well as assuring continued quality control of the welding process. A 1000 amp ac/dc current source was developed to aid in the calibration of these welding systems. The equipment used to create the current source is discussed. Engineering data is presented on the performance of the current source to date. The proposed technique for traceability to the National Bureau of Standards (NBS) is given. Test results of current sensors tested are presented and how these results will influence future tests are discussed. Future work is discussed for extending

the current source's accuracy and phase capability for the current source are discussed. DOE

CRYOGENIC MECHANICAL PROPERTIES OF HIGH-MANGANESE STEEL WELDMENTS
J. W. Chan and J. W. Morris, Jr. Aug. 1985 11 p Presented at the Cryogenic Engineering Conference and International Cryogenic Materials Conference, Boston, Mass., 12 Aug. 1985
(Contract DE-AC03-76SF-00098)
(DE86-005219; LBL-19226; CONF-850814-37) Avail: NTIS HC A02/MF A01

The structural alloys used in fusion reactor magnets of the next generation are required to have a 4.2 K yield strength and fracture toughness combination superior to that of alloys used currently. An alloy of nominal composition 18Mn-5Ni-16Cr-0.22N after proper thermomechanical treatment approaches the JAERI projected requirements and exceeds the proposed US requirements for 4.2 K yield strength and fracture toughness in the base metal. However, the properties in the welded condition are still uncertain. This work investigates the effect of autogenous GTAW on the cryogenic properties of this alloy. It was found that the 4.2 K yield strength of the weld can be increased through the addition of nitrogen to a 75% He/25% Ar shield gas; specifically, a yield strength comparable to that of the base metal was achieved for a 6 vol % nitrogen addition. Fracture toughness data are still preliminary; however, autogenous welds made on this alloy approach the US requirements for both yield strength and K/sub Ic/. DOE

CUTTING OF METAL COMPONENTS BY INTERGRANULAR CRACKING
J. Chavand (Commissariat a l'Energie Atomique, Grenoble, France), A. Gauthier, J. J. Lopez, and G. Tanis 20 Nov. 1985 86 p Transl. into ENGLISH from "Decoupe de Composants Mettalique, part Fissuration Intergranulaire" (France) Prepared for Pacific Northwest Labs., Richland, Wash.
(Contract DE-AC06-76RL-01830)
(DE86-006949; PNL-TR-454) Avail: NTIS HC A05/MF A01

The objective of this contract was to study a new steel-sheet cutting technique for dismantling nuclear installations without in principle producing secondary waste. This technique is based on intergranular cracking of steel induced by the combined action of penetration of molten metal into the steel and application of a mechanical load. Cutting has been achieved for stainless-steel sheets with thicknesses ranging from a few mm to 50 mm and for carbon-steel plates with thicknesses between 20 and 60 mm. For carbon steel is seems possible that components as thick as 100 mm can be cut. The tests have permitted selection of the heating methods and determination of the cracking parameters for the materials and range of thickness studied. In the case of thin sheets, results were obtained for cutting in varied positions suited to the techniques of dismantling in hot cells. A temperature-measuring system using an infrared camera has been developed to determine the variation of the temperature field established in the component. In association with the three-dimensional computation code COCO developed by the CEA, this system permits prediction of the changes in stresses in the cracked zone when the cutting parameters are modified. DOE

MECHAN: DYNAMIC ANALYSIS OF PLANAR MECHANISMS
Charles W. Radcliffe 1 Jul. 1985 70 p
(Contract W-7405-eng-48)
(DE85-018023; UCID-30200-83-11) Avail: NTIS HC A04/MF A01

The kinematic and dynamic analysis of many common planar mechanisms can be accomplished as a sequence of subproblems where each subproblem involves the analysis of a standard component. These standard components typically involve two rigid bodies and three points of connection between the bodies themselves and or other components which make up the complete mechanism. MECHAN is an interactive computer program for the kinematic and dynamic analysis of planar mechanisms. The program is written in Microsoft Basic (MS-Basic) and will run under either the CP/M or MS DOS operating system. MECHAN allows the user to interactively define the complete mechanism as a series of standard components, specify the input motion parameters, and begin either a kinematic or dynamic analysis of the mechanism. In addition to the analysis of the primary sequence of components, the program allows the specification of arbitrary points attached to any of the moving rigid bodies and the calculation of their position, velocity, and acceleration for each position of the input member. The input member can be specified as a rotating crank, a slider moving in an arbitrary direction, or a crank driven by a linear actuator such as a hydraulic cylinder. The output of the program is in the form of a series of tables which display the angular motion of each rigid body in the mechanism, the linear motion components for each point which has been identified, the relative sliding motion at each slider, and the force components at each joint where members are connected. The force analysis can include the effect of springs or viscous dampers acting between arbitrary pairs of points on separate members. Author

COMPOSITE TURBINE BLADE DESIGN OPTIONS FOR CLAUDE (OPEN) CYCLE OTEC POWER SYSTEMS
T. R. Penney Nov. 1985 7 p Presented at the 5th International Symposium and Exhibit on OMAE, Tokyo, Japan, 13 Apr. 1986
(Contract DE-AC02-83CH-10093)
(DE85-016876; SERI/TP-252-2792; CONF-860491-1) Avail: NTIS HC A02/MF A01

Small-scale turbine rotors made from composites offer several technical advantages for a Claude (open) cycle ocean thermal energy conversion (OTEC) power system. Westinghouse Electric Corporation has designed a composite turbine rotor/disk using state-of-the-art analysis methods for large-scale (100-MW sub e) open cycle OTEC applications. Near-term demonstrations using conventional low-pressure turbine blade shapes with composite material would achieve feasibility and modern credibility of the open cycle OTEC power system. Application of composite blades for low-pressure turbo-machinery potentially improves the reliability of conventional metal blades affected by stress corrosion. DOE

SYN-FUEL RECIPROCATING CHARGE PUMP IMPROVEMENT PROGRAM Quarterly Report, Jan. 1 - 31 Mar. 1985
1985 13 p
(Contract DE-AC22-82PC-50033)
(DE86-007482; DOE/PC-50033/T11) Avail: NTIS HC A02/MF A01

Two floating piston seals have been tested in the Ingersoll-Rand Standard Pump Div. Model No. 3V3 triplex reciprocating pump which was special built for this development program. The third leg of the pump was operated in the conventional mode to service as a baseline wear rate. The pump operated in a 110 mesh sand-water slurry at 150 rev. per minute with a plunger stroke of 3 inches and a piston stroke of 1.42 inches. This duplicated the intended piston speed and stroke of the Cattettsburg 7V3 reciprocating charge pump. However, the plunger stroke is unavoidably low, it should be seven inches to match the Catlettsburg pump. The pistons were flushed at the rate of 0.5%. The pump was operated for 200 hours. The flush liquid to the pump was interrupted for several hours because of a drive belt failure. However, even with that problem, biased on the observed wear rates during these tests, both seals should have a life in sand of approximately 500 to 550 hours. The wear rate in sand indicates that both seals would have a life in a coal slurry which would exceed two to four thousand hours. Both seals maintained a clean volume of liquid between the piston and the plunger/packing area throughout the tests. There was no change in operating characteristics during the 200 hour tests with both pistons. The conventional leg failed twice during the tests, requiring replacement of packing, plunger, and throat bushing. DOE

The efficiency and durability of various types of open shaft compressors for potential application to residential and light commercial gas engine-driven heat pump applications are examined. Variable speed efficiency data for hermetic, semihermetic, and open shaft compressors were obtained from the public literature and from compressor manufacturers in the U. S., Japan, and in Europe. Efficiency comparisons based upon refrigerants R12 and R22 at a fixed compressor pressure ratio indicate that reciprocating compressors have the highest coefficients of performance (COPs) for compressor speeds ranging from 1000 to 2500 rpm. Scroll and Wankel compressors appear to offer the highest COPs above 2500 rpm. An important finding is that open shaft compressors with proven life and reliability for residential gas engine heat pump applications do not appear to be available as production units. GRA

(Contract DE-AC05-84OS-21400)
(DE86-006515; Y/DW-580; CONF-8506110-7) Avail: NTIS HC A02/MF A01

An investigation is reported whose purpose was to determine the cause of amplitude variation that occurs during the ultrasonic inspection of very thin adhesive bonds. Results indicate that the metal-adhesive-metal package behaves like a narrow bandpass filter for signals in the ultrasonic domain. This effect is attributed to a mechanical resonance resulting from material thicknesses and acoustic impedances, and its effects on ultrasonic inspection are discussed. Further work is planned in determining the adhesive thickness of thin bonds ultrasonically and in extending inspection capabilities to include larger thickness range. DOE

Avail: NTIS HC A15/MF A01 CSCL 20K

This research centers on evaluation of thermoviscoplastic constitutive models for metals at elevated temperatures. The intent of the research was to improve existing experimental facilities at the research site, to compare existing models to experiment for the materials in question, and to extend existing models where necessary to better predict complex material response. Conclusions of the research to date include the following: (1) Euler's method is the most efficient for integrating the models of methods considered; (2)Walker's model is the most economical to integrate, while Miller's model is least economical and also tends to be unstable; (3) ISV theory can be used as a general framework for comparing all models in the current literature; (4) a laboratory has been developed to perform all of the complicated elevated temperature experiments necessary for the research; (5) for aluminum at room temperature, none of the models considered appears accurate at predicting uniaxial cyclic response; and (6) at 1100 deg F Walker's model appears to be most accurage for predicting the uniaxial cyclic response of IN718. EVALUATION OF THE NUMERICAL STABILITY AND SENSITIVITY OF MATERIAL PARAMETER VARIATIONS FOR SEVERAL UNIFIED CONSTITUTIVE MODELS
P. K. Imbrie, W. E. Haisler, and D. H. Allen *In its* Integrated Research in Constitutive Modelling at Elevated Temperatures, Part 1 Jun. 1986 88 p (For primary document see N86-30227 21-39)
(MM-4998-85-6-Pt-1) Avail: NTIS HC A15/MF A01 CSCL 20K

The sensitivity of unified constitutive theories to numerical integration techniques was investigated. Numerical simulations of Hastelloy-X at 1800 F were evaluated in uniaxial form. Both single and multistep integration schemes were used. The various algorithms were compared with regard to accuracy, stability, and computational economy. The material parameter sensitivity was studied by varying the material constants by a specified amount and comparing predicted responses. Numerical comparisons show that, of the numerical integration methods studied, Eulers method is the most accurate, stable, and efficient procedure. The input sensitivity studies indicated that some constitutive models are more sensitive to experimental errors than others and that a 5% error in certain material constraints may lead to 15 to 30% changes in predicted response. ON THE USE OF INTERNAL STATE VARIABLES IN THERMO-VISCOPLASTIC CONSTITUTIVE EQUATIONS
D. H. Allen and J. M. Beek *In its* Integrated Research in Constitutive Modelling at Elevated Temperatures, Part 1 Jun. 1986 20 p
Previously announced as N85-31536 (For primary document see N86-30227 21-39)
Avail: NTIS HC A15/MF A01 CSCL 20K

The general theory of internal state variables are reviewed to apply it to inelastic metals in use in high temperature environments. In this process, certain constraints and clarifications will be made regarding internal state variables. It is shown that the Helmholtz free energy can be utilized to construct constitutive equations which are appropriate for metallic superalloys. Internal state variables are shown to represent locally averaged measures of dislocation arrangement, dislocation density, and intergranular fracture. The internal state variable model is demonstrated to be a suitable framework for comparison of several currently proposed models for metals and can therefore be used to exhibit history dependence, nonlinearity, and rate as well as temperature sensitivity.

A COMPARISON OF CURRENT MODELS FOR NONLINEAR RATE-DEPENDENT MATERIAL BEHAVIOR OF CRYSTALLINE SOLIDS M.S. Thesis c76
Joachim Michael Beek *In its* Integrated Research in Constitutive Modelling at Elevated Temperatures, Part 1 Jun. 1986 148 p
(For primary document see N86-30227 21-39)
Avail: NTIS HC A15/MF A01 CSCL 20K

Three theories for prediction of inelastic deformation which are based on considerations of the microstructural behavior of materials are reviewed. The mechanics of continua with internal state variables and the historical development of constitutive modeling are summarized. A detailed discussion, including chronological development, review of theory, and method of determination of material parameters, of each model follows. An experimental data base is established from which the material parameters of the constitutive equations are calculated. Finally computer simulations of various load histories are performed and compared to the experiment, and conclusions of the ability of each theory to model inelastic deformation are drawn.

An experimental investigation was conducted at the Langley Research Center to determine a method for towing an aircraft to measure the side forces of a free-swiveling nose gear due to variations in bank angle. A F-106 aircraft and the Space Shuttle orbiter OV-101 were towed to measure side forces on full-size aircraft for bank angles up to 3 deg. These tests indicate that substantial side forces will occur if an aircraft is rolling on a runway in a banked attitude even when the nose gear is free to swivel. Corotation of a twin-tire nose gear appears to cause a substantial increase in side force due to bank angle compared with a nose gear with indepdendently rotating wheels.

A SIMPLE NONLINEAR JOINT MODEL
W. B. Fichter Aug. 1986 7 p
(NASA-TM-87749; L-16169; NAS 1.15:87749) Avail: NTIS HC A02/MF A01 CSCL 20K

Hertzian contact theory is applied to a butt joint with specially mismatched bearing surfaces to devise a simple mathematical model of nonlinear axial force-displacement behavior in jointed members. Normalized tangent stiffness-force plots, for several values of a joint imperfection parameter, are presented for the sample case of solid structural members of circular section. The results illustrate the potential problem of high joint compliance at low axial-force levels, as well as the generally desirable stiffening and linearizing effects of preload. A nonlinear oscillator problem based on the static model is also formulated and solved to illustrate the effect of amplitude on natural frequency. As expected, natural frequency is low when amplitude is small. The results call attention to the important roles that tight tolerances and preload are expected to play in the design and fabrication of deployable and erectable truss-type space structures.

COMPLIANCE MATRICES FOR CRACKED BODIES Final Report
R. Ballarini Jul. 1986 8 p
(Contract NCC3-46)
(NASA-CR-179478; E-3158; NAS 1.26:179478) Avail: NTIS HC A02/MF A01 CSCL 20K

An algorithm is presented which can be used to develop compliance matrices for cracked bodies. The method relies on the numerical solution of singular integral equations with Cauchy-type kernels and provides an efficient and accurate procedure for relating applied loadings to crack opening displacements. The algorithm should be of interest to those performing repetitive calculations in the analysis of experimental results obtained from fracture specimens.

CREEP AND FRACTURE CHARACTERISTICS OF MATERIALS AND STRUCTURES AT ELEVATED TEMPERATURES Technical Progress Report
Harold Liebowitz 14 Feb. 1986 348 p
(Contract N00014-84-K-0027)
(AD-A166575) Avail: NTIS HC A15/MF A01 CSCL 20/11

A major focus of the first year was on the mixed-mode fracture problem. Theoretical work on the computational methodology for the calculation of mixed-mode stress intensity factors was performed. The convergence properties of several algotithms were delineated and guidelines for the accurate calculation of mixed-mode stress intensity factors were established. This study also investigated the effects and influence of loading holes on the calculations. Appendices contained in this report refer to Determination of Two-Dimensional Stress Intensity; Fracture Under Mixed-Mode Loading; Prediction of Plasticity Characteristics for Three-Dimensional Fracture Specimens Comparison With Experiment; Accurate Modeling of Ductile and Creep Fracture Specimens and Processes; Creep Testing and Constitutive modeling; Finite Element Formulation for Creep Problems; Finite Element Methodology for Elastic Fracture Problems in 3-Dimensions.

REVIEW OF FRACTURE PROPERTIES OF NUCLEAR MATERIALS DETERMINED BY HERTZIAN INDENTATION
J. Routbort and H. Matzke 1985 13 p Presented at the

Conference on Indentation Fracture and Mechanical Properties of Ceramic Fuels, Waste Ceramics and Glasses, Karlsruhe, West Germany, 11 Nov. 1985 Prepared in cooperation with Commission of the European Communities, Karlsruhe, West Germany
(Contract W-31-109-eng-38)
(DE86-005520; CONF-8511146-1) Avail: NTIS HC A02/MF A01

A brief description of the determination of the surface fracture energy and the fracture toughness from a Hertzian indentation test is given. A number of theoretical and experimental problems are discussed. Results obtained on a variety of nuclear fuels and nuclear-waste-containment materials are reviewed and compared with values measured by other techniques. The Hertzian indentation test yields reliable fracture parameters. DOE

FAILURE ANALYSIS AND MICROCRACK DEPENDENT DISCONTINUUM MECHANICS
R. B. Stout Nov. 1985 15 p Presented at the International Conference and Exhibition on Fatigue, Corrosion Cracking, Fracture Mechanic and Failure Analysis, Salt Lake City, Utah, 2 Dec. 1985
(Contract W-7405-eng-48)
(DE86-006710; UCRL-92226; CONF-851203-1) Avail: NTIS HC A02/MF A01

The failure of many materials involves creating dense sets of microcracks. Each microcrack created results in a discontinuity in the deformation between atoms in the material and a change in the thermodynamic energy content of the material. Continuum mechanics does not provide a physical description of the discontinuities nor assign correct internal energy contributions for various thermodynamic processes during microcrack kinetics. In order to represent discontinuities in the deformation and various internal energy contributions during microcrack kinetics, a microcrack dependent discontinuum mechanics has been formulated. This discontinuum mechanics describes a microcrack density function in terms of physical attributes and statistical concepts; represents deformation as a functional to explicitly include interatomic discontinuities from the density of microcrack defects; and models both equilibrium and nonequilibrium thermodynamic processes of microcrack creation, microcrack growth, and microcrack surface energy changes. This contrasts to the empirical methodology of continuum mechanics that seeks a phenomenological description. An illustrative example of the microcrack dependent discontinuum approach is presented for the uniaxial tensile test. This analysis provides realistic representations for microcrack density evolution, local (true) stress response, and loading history for an input of total strain rate. DOE

RESIDUAL STRESS AND DEFORMATION ENERGY UNDER GROUND-SURFACES OF BRITTLE SOLIDS Thesis
O. Podzimek Sep. 1985 114 p
(WB-85-16; ESA-86-97356) Avail: NTIS HC A06/MF A01

Deformation energy accumulated under the surface of brittle solids, especially those of optical glass, during the free abrasive grinding process was analyzed. The distribution of deformation energy density in depth under the ground surface was investigated. A model for the free abrasive grinding process was derived using the deformation energy density experimentally determined in relation to the abrasive size, grinding rate, and input power. The model was validated against a series of relations between process parameters from the literature. ESA

INVESTIGATION OF THE EXTENT AND NATURE OF THE CRACKS FOUND IN SEGMENTS OF TWO Cr - 0.5 Mo PRESSURE VESSELS FROM THE NIL RESIDUAL CREEP LIFE PROGRAM
A. Deurhof and P. E. L. B. Rodrigues 22 Jul. 1985 25 p
(MR/814/85; ESA-86-97501) Avail: NTIS HC A02/MF A01

A metallographic investigation was carried out on samples taken from two 1 Cr - 0.5 Mo steel headers, operating at 525 C; 81 N/sqmm; 18,000 hr in a controlled test. A nozzle section from each vessel was examined. Both samples show discontinuous surface breaking cracks and microvoids. This damage could be due to reheat cracking which occurred during post weld heat treatment or due to creep. Micrographically it is not possible to distinguish between these two forms of cracking after the vessel is exposed to high temperature. Weld inplant testing may be a way of establishing the sensitivity of this material to reheat cracking and therefore clarify the cause of failure. ESA

42 GEOSCIENCES (GENERAL)

N86-30243# Instituto de Pesquisas Espaciais, Sao Jose dos Campos (Brazil).
BASIC ELEMENTS OF NUCLEAR GEOPHYSICS
D. J. R. Nordemann and E. B. Pereira 1984 31 p In PORTUGUESE
(DE86-700735; INPE-3002) Avail: NTIS (US Sales Only) HC A03/MF A01

Nuclear Geophysics applies the nuclear radiation detection methodology to the geosciences, specially to study the dynamical processes of the lithosphere, the hydrosphere and the atmosphere as well as some aspects of planetology and astrophysics. Here the main methods are described: alpha-ray and gamma-ray spectrometry, the interaction of alpha and gamma radiation with matter and the detectors used (grid chambers, surface barrier silicon detector for alpha radiation; and sodium iodide thallium activated phosphors, hyp··pure and lithium drifted germanium semiconductor detectors for gamma radiation). The principal applications of Nuclear Geophysics are given as examples to ilustrate the use of the methods described. DOE

VISUAL AERIAL PHOTOGRAPH TESTURE DISCRIMINATION FOR DELINEATING HOMOGENEOUS RESIDENTIAL SEGTORS: AN INSTRUMENT FOR URBAN PLANNERS
Maria doLourdes Neves deOliveiraKurkdjian May 1986 7 p Presented at the International Symposium on Remote Sensing, Enschede, Netherlands, Aug. 1986
(INPE-3896-PRE/938) Avail: NTIS HC A02/MF A01

A method is given for the definition of a geographical reference system to be used by planners in urban residential area analysis. The purpose of the method is to exploit, in the diagnosis, the spatial component of the town which is the concrete result of the interactions between its physical and social elements. The assumptions made are: (1) the urban residential areas in Brazilian

towns are extremely differentiated as a result of the social statification existent in the country; (2) there is a strong association between physical aspects of these areas and the socioeconomic characteristics of their resident population. The method preconizes the use of panchromatic aerial photographs at a scale of 1:10000 for the delimitation of homogeneous residential sectors. The procedures described are based on the human visual capability to descriminate different textures. In order to test its validity, survey data obtained through its application to Sao Jose dos Campos, SP, Brazil, were analysed using cluster analysis technique. The results of the work showed that photointerpretation may be usefully applied for delineating homogeneous residential urban sectors.

A PROCEDURE FOR EVALUATION OF DUST POTENTIAL IN DESERT TERRAINS
Ran Gerson, Sari Grossman, and Rivka Amit 1985 87 p
(Contract DAJA45-83-C-0041)
(AD-A166491) Avail: NTIS HC A05/MF A01 CSCL 08/2

The evaluation of dust potential in hot deserts is based on the association of well defined dust bearing soils and surficial deposits with specific landforms. Thses landforms are readily identified on airphotos (and in many cases on topographic maps and space imagery). The user may follow a sequence of operations, from the selection of a target area through the identification of relevant landforms and associated soils/surficial deposits, to the evaluation of the content, composition and distribution of dust in these media. The accompanying report is essential for the proper use of this procedure.

IMPLEMENTATION OF MAP-TO-IMAGE-CORRESPONDENCE FOR SYNTHETIC APERTURE RADAR IMAGE ANALYSIS
George E. Lukes and J. Hannes Raggam 1985 11 p
(AD-A166791; ETL-R-082) Avail: NTIS HC A02/MF A01 CSCL 08/2

Radargrammetric techniques, developed to support stereo mensuration and data capture from synthetic aperture radar (SAR) imagery, have been extended to enable map-to-image correspondence for computer-assisted radar image analysis. This mechanism projects existing digital map data into the image space of a new SAR image rigorously accounting for the sensor imaging geometry and terrain configuration. Prerequisites for SAR map-to-image correspondence include (1) an analytical sensor model, (2) recovery of the image acquisition parameters and (3) three-dimensional (3d) digital map data. Analytical radar mapping techniques address the first two issues. Suitable 3d planimetric map data can be compiled directly from stereo photography using analytical plotters or indirectly using elevation data interpolated from digital elevation models to augment conventional two-dimensional map data derived from manuscripts. The approach is illustrated by selected examples from a case study conducted for a test area near Frieburg, West Germany. Here, 3d digital data for transportation and landcover maps were assembled from cartographic sources using plan metric augmentation.

GEOLOGY AND PETROLEUM RESOURCES OF THE BARENTS-NORTHERN KARA SHELF IN LIGHT OF NEW GEOLOGIC DATA
G. Ulmishek Oct. 1985 93 p
(Contract W-31-109-eng-38)
(DE86-008472; ANL/ES-148) Avail: NTIS HC A05/MF A01

The Barents-northern Kara shelf, one of the largest continental shelves in the world, is still in the earliest stage of exploration for oil and gas. During the last several years, numerous seismic surveys have been conducted, a number of wells have been drilled, and several gas fields have been discovered. This report summarizes the geological data gathered during recent exploration activities and presents the changes in earlier concepts necessitated by consideration of these new data. The revised assessment of undiscovered petroleum resources is based on new information about the distribution and quality of source rocks and reservoir rocks and the structural framework of the shelf. Special attention is paid to evaluating the oil versus gas potential of the shelf, an evaluation that strongly depends on the expected offshore extension of oil-source facies in the Lower-Middle Triassic section. The most probable amounts of undiscovered petroleum resources of the shelf are estimated at 14.2 x 10 to the 9th power barrels of oil and 312.2 x 10 to the 12th power cubic feet of gas. The Finnmark trough, the south Barents and North Novaya Zemlya depressions, and the offshore continuation of the Timan-Pechora basin possess the great majority of these resources.

REPORT ON THE PHASE A STUDY OF A JOINT INDONESIAN-NETHERLANDS TROPICAL EARTH RESOURCES SATELLITE (TERS) PROGRAM
Mahsun Irsyam, ed. and Albert P. Hoeke, ed. Feb. 1985 45 p
(JTERS-84-10; ESA-86-97498) Avail: NTIS HC A03/MF A01

The baseline of the Tropical Earth Resources Satellite (TERS) System was established. Using the possibilities of the high true equatorial orbit, 4 observation opportunities per day, a coverage area of at least 10 deg N to 10 deg S latitude, and the selective viewing capability combined with a cloud sensor, the TERS concept is an appropriate system to complement and to compete with the conventional systems with optical instruments and planned radar systems. User requirements for TERS as a monitoring device for Indonesia are specified. Results of a cost/benefit assessment indicate expected benefits which for Indonesia alone may justify the investment. The political/legal aspects were assessed and a public information plan was drafted.

DESIGN AND INITIAL TESTING OF A ONE-BLADED 30-METER-DIAMETER ROTOR ON THE NASA/DOE MOD-O WIND TURBINE Final Report
R. D. Corrigan and C. B. F. Ensworth 1986 19 p Presented at the Energy-Sources Technology Conference Exhibition, New Orleans, La., 23-28 Feb. 1986; sponsored by ASME
(Contract DE-AI01-76ET-20320)
(NASA-TM-88810; E-3162; DOE/NASA-20320/70; NAS 1.15:88810) Avail: NTIS HC A02/MF A01 CSCL 10A

The concept of a one-bladed horizontal-axis wind turbine has been of interest to wind turbine designers for many years. Many designs and economic analyses of one-bladed wind turbines have been undertaken by both United States and European wind energy groups. The analyses indicate significant economic advantages but at the same time, significant dynamic response concerns. In an effort to develop a broad data base on wind turbine design and operations, the NASA Wind Energy Project Office has tested a one-bladed rotor at the NASA/DOE Mod-O Wind Turbine Facility. This is the only known test on an intermediate-sized one-bladed rotor in the United States. The 15.2-meter-radius rotor consists of a tip-controlled blade and a counterweight assembly. A rigorous test series was conducted in the Fall of 1985 to collect data on rotor performance, drive train/generator dynamics, structural dynamics, and structural loads. This report includes background information on one-bladed rotor concepts, and Mod-O one-bladed rotor test configuration, supporting design analysis, the Mod-O one-blade rotor test plan, and preliminary test results. DESIGN CONSIDERATIONS FOR STAND-ALONE PHOTOVOLTAIC SYSTEMS
R. N. Chapman 1986 11 p Presented at the 1st International Symposium on Applications of Solar and Renewable Energy, Cairo, Egypt, 23 Mar. 1986
(Contract DE-AC04-76DP-00789)
(DE86-006470; SAND-85-2390C; CONF-860322-1) Avail: NTIS HC A02/MF A01

Long-term availability, defined as the total energy delivered over the lifetime of a system divided by the total energy demand, is a major design criterion for stand-alone photovoltaic systems. Using long-term insolation data from 18 US sites and a newly developed performance model, we found that common sizing practices do not reliably provide desired availability. We developed a new technique that allows the designer to size for a specific long-term availability. This new technique can be used for most climatic types found worldwide and for any stand-alone photovoltaic system. The long-term insolation data and performance model were also used to study the yearly variations in availability. We found that even with systems designed for high long-term availability, there will be periods of very low availability. DOE

(DE86-006550; SAND-85-7014) Avail: NTIS HC A05/MF A01

Two computer codes, SCAP1D and SCAP2D, are being used to analyze silicon concentrator solar cells. The models used in these codes are constantly being evaluated for accuracy and are updated as necessary. For example, the effects of carrier-carrier scattering on mobility have been included and documented in this report. In addition, modifications to SCAP2D have been made to allow the modeling of minority carrier reflecting contacts. A semianalytical model was developed and used to estimate the theoretical limit of efficiency of silicon concentrator cells. It is predicted that efficiencies near 30% may be possible at high concentration. Reprints of published papers are included in the appendices. DOE

GALLIUM ARSENIDE AND MULTIBANDGAP SOLAR CELL RESEARCH Semiannual Subcontract Report, Apr. - Oct. 1984
S. M. Vernon and R. G. Wolfson Nov. 1985 56 p
(Contract DE-AC02-83CH-10093)
(DE85-016894; SERI/STR-211-2824) Avail: NTIS HC A04/MF A01

This report covers the first six months of research on high-efficiency, low-cost solar cells. The basic approach involved the heteroepitaxial growth of a III-V compound material onto a single-crystal silicon wafer. The growth technique employed was metal-organic chemical vapor deposition (MO-CVD) in an atmospheric pressure reactor. The silicon wafer may be a mechanical substrate and ohmic contact for a single-junction device, or it may contain a p-n junction of its own as the bottom cell of a two-junction, tandem device. The III-V single-junction cell material is GaAs and the two-junction material is either GaAlAs or GaAsP; either material could yield a band gap of about 1.7eV. Single-crystal films of Ge, deposited onto silicon wafers by CVD, are also being studied. DOE

WIND TURBINE FATIGUE CONSIDERATIONS
D. Berg 1985 10 p Presented at the IEA Fatigue Experts Meeting, Stuttgart, West Germany, 28 Nov. 1985
(Contract DE-AC04-76DP-00789)
(DE86-006499; SAND-85-2617C; CONF-8511164-1) Avail: NTIS HC A02/MF A01

Current methods of analyzing wind turbine fatigue life are reviewed and found to be inadequate. One reason for this inadequacy is that these methods treat material fatigue properties as well-defined values, when they are, in fact, more accurately described as statistically varying values. Tools for incorporating statistically varying properties into fatigue life analysis exist, and development of improved analysis methods is currently in progress. Easy access to a wind turbine material fatigue characteristics data base and recommended procedures for determining factors of safety would increase the confidence level in fatigue life estimation. RESEARCH ON HIGH-EFFICIENCY, SINGLE-JUNCTION, MONOLITHIC, THIN-FILM AMORPHOUS SILICON SOLAR CELLS Semiannual Subcontract Progress Report, 1 Dec. 1984 - 31 May 1985
G. R. Ashton, F. E. Aspen, R. L. Jacobson, F. R. Jeffrey, and N. T. Tran Jan. 1986 85 p
(Contract DE-AC02-83CH-10093)
(DE86-004420; SERI/STR-211-2861) Avail: NTIS HC A05/MF A01

This report presents interim results of research in high-efficiency, single-junction, monolithic thin-film amorphous silicon solar cells, which consists of five research tasks: (1) amorphous silicon materials research, (2) nonsemiconductor materials research, (3) solar cell research, (4) monolithic, intraconnected cells/submodule research, and (5) multichamber deposition system research. The subcontracted work reported here advances the state of the art in thin-film amorphous silicon solar cell development through work on flexible substrates. A multichamber deposition system for depositing a-Si onto polyimide flexible web is essentially complete. DOE

N86-30259# North Carolina State Univ., Raleigh. Dept. of Materials Engineering.
RAPID THERMAL PROCESSING OF ION IMPLANTED SILICON AS A VIABLE SOLAR CELL TECHNOLOGY Quarterly Report, Nov. 1985 - Jan. 1986
G. A. Rozgonyi 31 Jan. 1986 20 p
(DE86-008216; DOE/JPL-957175/Q3) Avail: NTIS HC A02/MF A01

The main objective of the past quarter was to find the optimal pre-process heat treatment for enhancing minority carrier lifetime. The silicon substrates were both n- and p-type and had varied oxygen concentration and process induced defects. Pre-process heat treatments include traditional furnace thermal cycling and low thermal budget rapid thermal process (RTP). The rapid thermal process was performed in Ar, while furnace annealing had either N2 or O2 ambients. Chemical etch-pit delineation, x-ray topography and FTIR techniques were used to determine the bulk gettering and oxygen precipitation for the heat-treated Si substrates. Minority carrier generation lifetime and the change of oxygen content were measured before and after heat treatment. DOE

LASER-ASSISTED SOLAR CELL METALLIZATION PROCESSING Annual Report, 13 Dec. 1984 - 30 Sep. 1985
A. Rohatgi, P. G. McMullin, and T. W. OKeeffe Jan. 1986 57 p
(Contract DE-NAS7-100-9-56615)
(DE86-008328; DOE/JPL-956615/86/2) Avail: NTIS HC A04/MF A01

In this contract, Laser-assisted processing techniques for producing high-quality solar cell metallization patterns are being investigated, developed, and characterized. The tasks comprising these investigations are outlined. Four new batches of solar cells were processed, in addition to several test runs on wafers, using the laser decomposition of spun-on silver neodecanoate to metallize cells. Decomposition of silver neodecanoate was carried out at different laser powers on different cells on a given wafer to determine whether this would have any effect on cell performance. A one watt laser power gave an electroplated linewidth of 50 microns , while at 8 watts the line width was 90 microns. DOE

DATABASE ASSESSMENT OF POLLUTION CONTROL IN THE MILITARY EXPLOSIVES AND PROPELLANTS PRODUCTION INDUSTRY Final Report
Bimal C. Pal and Michael G. Ryon Feb. 1986 222 p
(Contract DE-AC05-85OR21400)
(AD-A165853; ORNL-6202) Avail: NTIS HC A10/MF A01 CSCL 13/2

A database on the current and proposed methods of pollution abatement in the munition production industry is presented. Information on current pollution status and waste treatment methods for the Army ammunition plants (AAPs) is also presented. Section 2 of this document deals with the physical and chemical properties of selected explosives, by-products, and related materials. Section 3 deals with the manufacture of the specific munitions. A scenario is presented in Section 4 to show the interaction among different agencies involved in the pollution abatement program. Actual and potential air pollution, water pollution, and solid wastes from the AAPs are covered in Sections 5 through 7. The current pollution and pollution abatement status of the various AAPs is discussed in Section 8. Modernization, waste management, monitoring programs, and regulatory aspects are the respective subject matter of Sections 9 through 12. Data gaps and research needs identified as a result of literature analysis are discussed throughout the document. The general term

TNT is used in this document to imply the specific isomer, alpha-trinitrotoluene. GRA

PANDORA: AN ELEVEN-BOX GEOCHEMICAL MODEL OF THE WORLD OCEAN
T. H. Peng and W. S. Broecker 1985 10 p Presented at the Carbon Transfer Conference, Lake Arrowhead, Calif., 5 May 1985 Prepared in cooperation with Lamont-Doherty Geological Observatory, Palisades, N.Y.
(Contract DE-AC05-84OR-21400)
(DE86-006122; CONF-8505239-1) Avail: NTIS HC A02/MF A01

To evaluate the impacts on the CO2 content of the atmosphere caused by possible differences between the operation of the glacial and the interglacial ocean-atmosphere systems, an 11-box global ocean model was developed which operates something like the real system. The individual reservoirs in this model are identified as (1) northern Atlantic. (2) surface Atlantic, (3) intermediate North Atlantic, (4) deep Atlantic, (5) intermediate South Atlantic, (6) surface Antarctic, (7) deep Antarctic, (8) intermediate Indopacific, (9) surface Indopacific, (10) deep Indopacific, and (11) northern Pacific. This report discusses the basic model structure. DOE

IMPACT OF CO2 ON THE CLIMATE CHANGE IN NORTH AMERICA DURING THE 20TH CENTURY Final Report, 1 Aug. 1984 - 31 Jul. 1985
G. J. Kukla Dec. 1985 11 p
(Contract DE-AC02-83ER-60162)
(DE86-006126; DOE/ER-60162/3) Avail: NTIS HC A02/MF A01

The geographic and seasonal pattern of changes in the mean maximum, minimum and average surface air temperature, as well as precipitation over North America between 1941 and 1980 was examined. An analysis of the data revealed a statistically significant decrease in the temperature range, particularly in summer and early autumn. The decrease in the range appears to be associated with increasing precipitation at many stations. However, further statistical tests have shown that increased precipitation, and by inference, atmospheric water vapor and cloud cover can not fully account for the large number of stations with a decreased range. Using climate division data over the United States, a recent increase in spring and summer temperature of approx.1(0)C and decrease in precipitation by 20 to 40% was found for the Central and Northern Great Plains. Comparisons of urban/rural station pairs in North America revealed an annual mean relative warming of the urban sites of between 0.12 and 0.15(0)C/decade. DOE

DIRECT EFFECTS OF INCREASING CARBON DIOXIDE ON VEGETATION
B. R. Strain, ed. and J. D. Cure, ed. Dec. 1985 304 p
(DE86-007397; DOE/ER-0238) Avail: NTIS HC A14/MF A01

CO2 is an essential environmental resource. It is required as a raw material of the orderly development of all green plants. As the availability of CO2 increases, perhaps reaching two or three times the concentration prevailing in preindustrial times, plants and all other organisms dependent on them for food will be affected. Humans are releasing a gaseous fertilizer into the global atmosphere in quantities sufficient to affect all life. This volume considers the direct effects of global CO2 fertilization on plants and thus on all other life. Separate abstracts have been prepared for individual papers. DOE

THE INFLUENCE OF NEGATIVE IONS ON THE INCOHERENT DIFFUSION OF ELECTROMAGNETIC WAVES IN THE D REGION OF THE IONOSPHERE Ph.D. Thesis - Brussels Univ., Belgium [INFLUENCE DES IONS NEGATIFS SUR LA DIFFUSION INCOHERENTE D'UNE ONDE ELECTROMAGNETIQUE DANS LA REGION D DE L'IONOSPHERE TERRESTRE]
J. Wisemberg 1985 283 p In FRENCH; ENGLISH summary
(Aeronomica-Acta-A-302-1985; ESA-86-97484) Avail: Issuing Activity

A systematic analysis of the chemistry of charged particles is developed using signal flow graph theory. A matrix formalism based on a hydrodynamic approach is presented. The method takes into account the fluctuations linked to the probabilistic aspect of the chemical reactions in the D region. A characteristic distance, different from the Debye distance, is introduced to relate the chemistry of negative ions to the power level and the width of the spectra. The use of equivalent models leads to a stochastic approach which describes the chemical fluctuations. The analysis and a numerical simulation method show that the chemical fluctuations are an important mechanism in the incoherent scattering. A research study of the form of the possibly observable spectra in the polar D region during corpuscular precipitation is presented. ESA

LATITUDINAL VARIATION OF DS
R. P. Kane May 1986 19 p Submitted for publication Sponsored by Fundo Nacional de Desenvolvimento Cientifico e Tecnologico
(INPE-3906-PRE/947) Avail: NTIS HC A02/MF A01

Using the data from several locations for a few selected events, the latitudinal variation of a storm-time logitudinal inequality component (DS) is studied. From a maximum near equator, DS seems to drop very sharply in the first 10 degree and then more slowly up to about 20 degrees, followed by an increase up to about 30 degrees. Some ionospheric contributions may be present during daytime. Author

THERMAL ION HEATING IN THE VICINITY OF THE PLASMAPAUSE: A DYNAMICS EXPLORER GUEST INVESTIGATION Final Report, Oct. 1984 - Mar. 1985
Richard H. Comfort Mar. 1986 13 p
(Grant NAG5-475)
(NASA-CR-176993; NAS 1.26:176993) Avail: NTIS HC A02/MF A01 CSCL 04A

The ion thermal structure of the plasmasphere was investigated in a series of experiments. It appears that energy may be generally available to ion and electrons in the vinicity of the plasmapause from Coulomb interactions between ambient thermal plasma and low energy ring current and suprathermal ions, particularly O+. The amount of energy transferred depends on the densities and energies of each of the components. The spatial distribution of heating in turn depends critically on the spatial distribution of the different populations, especially on the density gradients. The spatial distribution of the thermal plasma is found to vary significantly on a diurnal time scale and is complicated by the plasmasphere erosion and refilling processes associated with magnetic activity and its aftermath. Thermal ion composition also appears to be influenced by the heating taking place, often increasing the heavy ion population in the vicinity of the plasmapause. The observations of equatorial heating near the plasmapause in the presence of equatorial noise also raise the likelihood of a wave source of energy. It is not unreasonable to expect that both particle and wave heat sources are significant, although not necessarily at the same times and places. B.G.

PERTURBATIONS OF THE RICHARDSON NUMBER FIELD BY GRAVITY WAVES Final Technical Report, 1 May 1979 - 31 Dec. 1984
M. G. Wurtele and R. D. Sharman 1 Jul. 1985 74 p
(Grant NsG-4024)
(NASA-CR-176910; NAS 1.26:176910) Avail: NTIS HC A04/MF A01 CSCL 08N

An analytic solution is presented for a stratified fluid of arbitrary constant Richardson number. By computer aided analysis the perturbation fields, including that of the Richardson number can be calculated. The results of the linear analytic model were compared with nonlinear simulations, leading to the following conclusions: (1) the perturbations in the Richardson number field, when small, are produced primarily by the perturbations of the shear; (2) perturbations of in the Richardson number field, even when small, are not symmetric, the increase being significantly larger than the decrease (the linear analytic solution and the nonlinear simulations both confirm this result); (3) as the perturbations grow, this asymmetry increases, but more so in the nonlinear simulations than in the linear analysis; (4) for large perturbations of the shear flow, the static stability, as represented by N2, is the dominating mechanism, becoming zero or negative, and producing convective overturning; and (5) the convectional measure of linearity in lee wave theory, NH/U, is no longer the critical parameter (it is suggested that (H/u sub 0) (du sub 0/dz) takes on this role in a shearing flow). The distribution of atmospheric ozone is nonuniform both in space and time. Local ozone concentration vary with altitude, latitude, longitude, and season. Two year ozonesonde data, January 1981 to December 1982, observed at four Canadian stations and 2.5 year backscattered ultraviolet experiment data on the Nimbus-4 satellite, April 1970 to August 1972, observed over five American stations were used to study the relationship between the total ozone, vertical height distribution of the ozone mixing ratio, vertical height distribution of half total ozone, and the local tropopause height. The results show that there is a postive correlation between total ozone in Dobson Units and the tropopause height in terms of atmospheric pressure. This result suggests that local intrusion of the statosphere into the troposphere, or the local decreasing of tropopause height could occur if there is a local increasing of total ozone. A comparison of the vertical height distribution of the ozone mixing ratio, the modified pressure height of half total ozone and the tropopause height shows that the pressure height of an ozone mixing ratio of 0.3 micrograms/g, and the modified pressure height of half total ozone are very well correlated with the tropopause pressure height. TURBULENT HEATING AND TRANSFER IN THE STRATOSPHERE AND LOWER MESOSPHERE
Samuel P. Zimmerman and Thomas J. Keneshea 9 Aug. 1985 40 p
(AD-A166591; AFGL-TR-85-0184; AFGL-ERP-925) Avail: NTIS HC A03/MF A01 CSCL 04/1

The analysis of rocketsonde experimental data from 20 to 70 km altitude and from a latitude band 9.3 deg N to 76.6 N, grouped around longitude 78 deg W + or - 2.5 deg, results in the determination of the dynamically and statically unstable regions of the stratosphere and lower mesosphere. Richardson number normalization of the ratio of non-dimensional turbulent to mean parameters, allows us to extrapolate these results to the upper atmosphere. At the Richardson number (R sub i) indicated unstable regions, the steady state turbulent energy rate equation is solved, resulting in heat and momentum transfer coefficients, fluxes, and the rate of energy dissipation. Given contiguously unstable regions, the vertical heat and momentum flux divergences are also determined. Summer and winter averages of the results of these analyses are given. GRA

A CUMULUS PARAMETERIZATION STUDY WITH SPECIAL ATTENTION TO THE ARAKAWA-SCHUBERT SCHEME
Chih-Yue J. Kao and Yoshi Ogura Jun. 1985 224 p
(Contract F19628-82-K-0030)
(AD-A166801; AFGL-TR-85-0159; SR-1) Avail: NTIS HC A10/MF A01 CSCL 04/1

The importance of the vertical transports of heat, moisture, vorticity, and momentum by cumulus clouds has long been recognized not only in the numerical predictions of weather and climate but also in the simulation studies on mesoscale circulations such as tropical convective systems, mid-latitude frontogenesis, and the sea-land breeze. However, it is impractical to resolve those individual cumulus clouds because of the distinct scale difference between them and larger-scale circulations. In the past two decades, there have been numerous attempts to relate subgrid-scale cumulus convection to large-scale fields by specifying the cumulus activity as a function of large-scale variables, which is now commonly referred to as cumulus parameterization. The goal of cumulus parameterization is to predict the change of large-scale disturbances due to cumulus convection by describing not each of the many individual clouds, but only their collective effects. THE EFFECT OF FINITE BLOB SIZE ON THE CURRENT CONVECTIVE INSTABILITY IN THE AURORAL IONOSPHERE
J. D. Huba and P. K. Chaturvedi 11 Apr. 1986 36 p
(AD-A166806; NRL-MR-5730) Avail: NTIS HC A03/MF A01 CSCL 04/1

It has been suggested that the current convective instability may be responsible for the structuring, i.e., generation of density irregularities, of density enhancements (known as blobs) in the auroral ionosphere. However, previous theories have neglected the finite extent of the blob along the geomagnetic field. In this paper we develop a non-local theory of the current convective instability which considers the finite extent of an ionospheric blob parallel to the geomagnetic field. We find that the growth rate of the instability can be substantially reduced in the finite-sized blob case from the value obtained in the local approximation for an infinitely long blob. For auroral ionosphere parameters, the reduction in the growth rate for medium scale irregularities (1-10 km) can be one to two orders of magnitude for the typical observed values of blob sizes (approx. a few hundred km). Thus, it appears that the current convective instability is not a viable mechanism to generate scintillation causing irregularities, i.e., 1-10 km irregularities. GRA

SOME THOUGHTS ON THE MODELING OF ATMOSPHERIC TURBULENCE FROM THE PERSPECTIVE OF A NON-EXPERT
D. Berg 1985 8 p Presented at the 14th IEA experts Meeting on Turbulence Loads on Wind Turbines, Stockholm, Sweden, 4 Dec. 1985
(Contract DE-AC04-76DP-00789)
(DE86-006493; SAND-86-0014C; CONF-851259-2) Avail: NTIS HC A02/MF A01

Recent work with a wind turbulence model has demonstrated that the effects of wind turbulence may be large. This work also illustrates that turbulence models do not need to accurately reproduce all the details in the physical wind to be of benefit to the wind turbine community. Their use, however, will be facilitated if they are packaged in easy-to-use codes that function as subroutines. Several US projects which are now in the planning stages are designed to measure the turbulence in the incident wind and the resultant response of the turbine. Knowledge gained from these tests will enhance our understanding of the role of turbulence in turbine response. DOE

OCCULTATION OF THE ATS-3 SATELLITE BY THE AVEFRIA BARIUM ION CLOUD
T. J. Fitzgerald, D. J. Simons (Los Alamos National Lab., N. Mex.), M. B. Pongratz, and J. R. Clynch (Texas Univ., Austin.) Oct. 1985 28 p Prepared in cooperation with Los Alamos National Lab., NM.; Texas Univ., Austin.
(Contract DE-AC08-83NV-10282)
(DE86-008346; EGG-10282-5018) Avail: NTIS HC A03/MF A01

The barium ion cloud from the May 1978 AVEFRIA DOS barium release experiment occulted the line of sight (LOS) from the Antelope Valley, Nevada ground observation station to the ATS-3 satellite for approximately 5 minutes. This opportunity was used to measure and calculate the radio scintillations caused by the cloud. Optical measurements were compared to the radio measurements of scintillations. The barium cloud was measured optically with intensified cameras by viewing the 455.4-nm wavelength fluorescent ion line. The amplitude scintillations of the 136.47-MHz signal from the ATS-3 satellite were monitored. It was found that the radio scintillation patterns calculated from optical observations were approximately in agreement with the radio measurements. The calculated patterns are unable to produce the short timescale (less than a few seconds) details observed by radio, and contain time shifts due to cloud evolution not considered in the analysis. Possible sources for the limitations of the optical method are identified and recommendations are made for improvements. DOE

THE PHYSICAL AND EMPIRICAL BASIS FOR A SPECIFIC CLEAR-AIR TURBULENCE RISK INDEX Final Report, 2 Jul. 1982 - 30 Aug. 1985
John L. Keller Washington NASA Apr. 1986 48 p
(Contract NAS8-34687)
(NASA-CR-3971; NAS 1.26:3971) Avail: NTIS HC A03/MF A01 CSCL 04B

The fundamental emphasis of this research was to develop a technique which would be a significant improvement over those currently used for flight planning to avoid clear air turbulence (CAT). The technique should, ideally, be both quantitative in determining potential intensity and specific in locating regions of relatively high risk. Furthermore, it should not rely on specialized data but be functional using the currently available rawinsonde observation (raob) system. Encouraging results documented in an earlier investigation were considered compelling enough to warrant a closer look into the possibilities of a Specific Clear Air Turbulence Risk (SCATR) index approach to the clear air turbulence problem. Unlike that research, which considered sustained periods of flight in light to moderate clear air turbulence, this study focuses on several cases of documented severe CAT. Results of these case studies suggest that a SCATR index is not an unrealizable goal and that uses of such an index, event in its current prototype level of development, are also apparent. Author

THE DEVELOPMENT OF AGROMETEOROLOGICAL SERVICES IN FINLAND
Aulis Ansalehto, Esko Elomaa, Martti Esala, and Anneli Nordlund Dec. 1985 28 p
(FMI-TN-31; ISBN-951-697-231-4; ISSN-0355-1733) Avail: NTIS HC A03/MF A01

A study for developing meteorological and advisory service for agriculture was carried out in Finland for the years 1982 to 1984. The Finnish Meteorological Institute, the Agricultural Research Centre, the Association of Agricultural Producers in Finland formed a working group for the task. The goal was to present the requirements of agrometeorological research and the need of daily service, to estimate costs and benefits of the service and to make suggestions for the agrometeorological service in the whole country. In three growing seasons 1982 to 1984 the working group offered experimental services for farmers in a small area in southern Finland. For evaluating the service questionnaires were sent to farmers. The potential benefits and losses were also considered. The cost/benefit-ratio has been evaluated by agronomic experts and the work was based on the answers of farmers. It turned out to be 1/30. At the 1984 cost level, we could estimate the cost of a nationwide agrometeorological service at around FIM 4.2 million a year. The total yearly national benefit would then be around FIM 120 million. In 1985 the working group made its proposals for extending the agrometeorological service to the whole country during the years 1986 - 1991. Author

(Contract NCC5-29)
(NASA-CR-176880; NAS 1.26:176880) Avail: NTIS HC A02/MF A01 CSCL 04B

Research conducted during the past year in the climate and atmospheric modeling programs was focused on the development of appropriate atmospheric and upper ocean models, and preliminary applications of these models. Principal models are a one-dimensional radiative-convection model, a three-dimensional global climate model, and an upper ocean model. Principal application is the study of the impact of CO_2, aerosols and the solar constant on climate. Also the performance of the International Satellite Cloud Climatology Project cloud detection algorithm was evaluated, concentrating initially on its application to geosynchronous data, with an eventual switch of the developed methodologies to data from polar orbiting satellites. In the process, a number of improvements were made, in particular: an improved technique for tracking small scale day to day variability in clear sky continental temperatures; a number of techniques for the statistical assessment of cloud detection uncertainties due to cloud types which are spatially and temporally invariant; and a method used to detect those cloudy regions which have long term spatial and temporal stability. (AD-A166227; ESMC-TR-85-07) Avail: NTIS HC A02/MF A01 CSCL 04/2

The United States Air Force (USAF) Air Weather Service's Detachment 11 of the 2nd Weather Squadron is tasked to provide meteorological and environmental support to the USAF Eastern Space and Missile Center (ESMC), the National Aeronautics and Space Administration's (NASA) Kennedy Space Center (KSC), and the Department of Defense (DOD) Manager for Space Shuttle Support Operations. They provide weather support to the Cape Canaveral Air Force Station (CCAFS), Patrick Air Force Base (PAFB), KSC, and the entire Eastern Test Range (ETR); primarily through the Cape Canaveral Forecast Facility (CCFF). The CCFF is a 24-hour-a-day forecasting and observing operation. As part of its normal support, it provides specialized forecasts for all missile and space launches from the ETR/KSC and weather services for recovery forces. By far, the launch, landing, and ground operations of the Space Shuttle require the most precise weather support. Most aspects of Space Shuttle operations are sensitive to one or more meteorological parameters. As the Shuttle proved itself in its early missions and became operational with a significant increase in the number of scheduled missions, it was evident that weather and weather support would become critical elements in achieving and maintaining the higher launch rate. Through the efforts of the MSMP, and joint funding by the Air Force and NASA, several improvements in meteorological systems were accomplished, allowing better utilization of satellite data. GRA

AFOSR (AIR FORCE OFFICE OF SCIENTIFIC RESEARCH) CHEMICAL AND ATMOSPHERIC SCIENCES PROGRAM REVIEW (29TH)
Larry P. Davis and Eunice L. Luther Sep. 1985 117 p
(AD-A166285; AFOSR-TR-85-0960) Avail: NTIS HC A06/MF A01 CSCL 04/2

A review is presented of research efforts sponsored by the Directorate of Chemical and Atmospheric Sciences which have completed their period of support. Illustrated accounts resulting from the basic research programs in the Atmospheric and Chemical Sciences are highlighted. The Atmospheric Science is concerned with meteorology and upper atmospheric structure and dynamics. The meteorology focuses on mesoscale meteorology, cloud physics, and atmospheric dynamics. The Chemical Sciences deal with chemical techniques, chemical structures, surface chemistry, chemical dynamics, and synthesis and properties of materials. GRA

ANOMALOUS US WEATHER PATTERNS ACCOMPANYING STRATOSPHERIC SUDDEN WARMING M.S. Thesis
Donald A. Douglas May 1985 123 p
(AD-A166371; AFIT/CI/NR-86-8T) Avail: NTIS HC A06/MF A01 CSCL 04/1

Key signatures of tropospheric circulation are investigated for months during which major Stratospheric Sudden Warming (SSW) occurred in the period 1955 to 1980. For the contiguous United States, monthly values of cyclone frequency, storm paths, precipitation and surface temperature are determined for 17 January and February months and compared against the years in which no SSW events occurred. Consistent with studies of energetics which show that the troposphere loses energy to the stratosphere during SSW, cyclone frequency is approximately 22% less during SSW. Also, consistent with a modification of planetary-scale waves during SSW, mean storm tracks are altered. Most notably, the Colorado Low disappears during SSW. Precipitation totals reflect the changes in cyclone behavior. The Ohio River Valley is the most anomalously dry region of an abnormally dry United States during SSW. During February, the southwestern states exhibit anomalously high precipitation totals. Surface temperatures are significantly below normal, especially east of the Rocky Mountains. During January, every state shows below normal temperatures except Nevada. Author (GRA)

FACTORS LEADING TO THE FORMATION OF ARC CLOUD COMPLEXES M.S. Thesis
Mark John Welshinger Dec. 1985 123 p
(AD-A166501; AD-E750871; AFIT/CI/NR-86-11T) Avail: NTIS HC A06/MF A01 CSCL 04/1

As a thunderstorm propagates past a station there is a rise and oscillation of the surface pressure. Downdrafts descending from thunderstorm cells are the source of air forming a cold dome over the ground which leads to a rise in surface pressure. If the cold downdrafts are strong enough and last for a sufficient time, an organized high pressure system develops at the surface, which is called a mesohigh. In satellite imagery the leading edge of a mesohigh appears as an arc-shaped line of convective clouds moving out in all directions from a dissipating thunderstorm area. Twelve mesoscale convective systems (MCSs) were investigated. The duration of the gust front, produced by each MCS, was used to classify the MCSs. Category 1 MCSs were defined as ones that produced a gust front which lasted for more than 6 h; there were 7 category 1 MCSs in the sample. Category 2 MCSs were defined as ones that produced a gust front which lasted for 6 h or less; there were 4 category 2 MCSs. All the category 1 MCSs produced arc cloud complexes (ACCs), while only one of the category 2 MCSs produced an ACC. Composite analyses showed that Category 1 MCSs, on average, had higher thunderstorm heights, greater precipitation intensities, colder cloud top temperatures and produced larger magnitudes of surface divergence than category 2 MCSs. DAYTIME AND NIGHTTIME NEUTRAL WIND AND TEMPERATURE MEASUREMENTS FROM INCOHERENT SCATTER RADAR AT 300 KM OVER ARECIBO M.S. Thesis
Leslie O. Belsma Dec. 1985 40 p
(AD-A166600; AFIT/CI/NR-86-33T) Avail: NTIS HC A03/MF A01 CSCL 04/1

Arecibo's twenty acre spherical radar reflector detects the weak electromagnetic energy reflected when pulses are transmitted into the ionosphere. The information contained in this reflected energy reveals the electron temperature, the electron/ion temperature ratio, the line of sight plasma velocity and the electron density among other parameters. This information, combined with neutral densities obtained from the global thermospheric model based on Mass Spectrometer and Incoherent Scatter data, MSIS-83, is used to determine the neutral temperature and winds in the F region. This study pertains to the F2 region at a height of 300km over Arecibo (18 N latitude with a magnetic dip angle of 50). A few trends in previous data are noted, followed by a description of the 300km temperature and neutral wind for daytime and nighttime from 12 days of data, in sets of three days, from January 1984 and 1985, September 1984, and June, 1984. The experimental neutral temperature is compared to the MSIS model prediction. The observed temperature closely agrees in phase, but averages 50K lower than the mode l. GRA

EXTREME WINDS AND TORNADOES: AN OVERVIEW
J. R. McDonald 1985 82 p Presented at the DOE Natural Phenomena Hazards Mitigation Conference, Las Vegas, Nev., 7 Oct. 1985
(Contract W-7405-eng-48)
(DE86-006162; UCRL-15745; CONF-8510118-Pt-4) Avail: NTIS HC A05/MF A01

The objective of this course on extreme winds, hurricanes, and tornadoes is to provide an overview of these natural phenomenon from the perspective of design of new buildings and structures or the evaluation of existing ones. Information is directly applicable to design and evaluation processes. The premise is that the facility under consideration, which may consist of various building, structures, processing equipment, stacks, ventilation ducts, etc., can be classified into certain categories, depending on the importance of the mission performed in the facility or the hazard that is presented by the particular operation. Having classified the facility into an appropriate category will automatically define certains design goals for the facility. The design goals are then met by selecting a design wind speed that is appropriate for the specified exceedance probability and by following certain specified design procedures. The problem then is to determine appropriate wind loads and other applicable loads, including dead loads, live loads, seismic loads, and other loads that may act on the structures. The design process can then proceed in the usual manner. In the case of existing facilities the strengths of the various structural elements, subsystems, and systems are evaluated and these strengths are related to wind speeds that would result in failure to meet the design goals. GRID POINT SURFACE AIR TEMPERATURE DATA SET FOR THE SOUTHERN HEMISPHERE
P. D. Jones, S. C. B. Raper, C. M. Goodess, B. S. G. Cherry, and T. M. L. Wigley Feb. 1986 79 p
(Contracts DE-FG02-86ER60397; DE-AC02-79EV-10098)
(DE86-007205; DOE/EV-10098/6) Avail: NTIS HC A05/MF A01

A compilation of 610 station records of monthly surface air temperature has been assembled for the Southern Hemisphere, north of 62.5(0)S. In order to use these data to construct the first grid point temperature data set for the Southern Hemisphere, the homogeneity of each of the station records has been assessed. Each station has been classed into one of three groups: immediately usable, corrected, or uncorrectable. The results are presented in tabular form. Of the 610 station records, 293 were used to produce a gridded data set on a 5(0) latitude by 10(0) longitude grid between 5(0)S and 60(0)S inclusive. Grid point

anomalies for 1851 to 1984, with respect to the reference period 1951 to 1970, were interpolated from station data using a simple algorithm. In order to produce a best possible data set, Antarctic data were included after they became available in 1957. DOE

THE MAGNETIC EFFECTS OF SHALLOW WATER INTERNAL SOLITONS
Alan D. Chave Mar. 1986 52 p
(Contract N00014-85-C-0104)
(AD-A165852; SIO-REF-86-7) Avail: NTIS HC A04/MF A01 CSCL 08/3
Since internal waves are a common feature of the oceans, there has been some interest in computing their electromagnetic effects in order to assess their role in the oceanic electromagnetic environment. This report extends previous analyses to cover the electromagnetic effects of coastal internal wave packets. While no observations of the electromagnetic fields produced by them have been reported, the large amplitude of shallow water internal waves is expected to induce substantial electromagnetic anomalies. The report is organized into five sections. The next part contains a review of oceanographic observations of internal wave packets from both surface ships and satellite imagery. Section 3 outlines the hydrodynamic theory for nonlinear internal waves. Section 4 contains a derivation of expressions for the electromagnetic fields produced by an isolated internal solution both at the seafloor and above the sea surface. The last part of the report contains a discussion of the theoretical results, including a detailed look at the predicted magnetic field using measured parameters from three well-documented occurrences of internal wave packets.GRA

MECHANICAL PROPERTIES OF MULTI-YEAR SEA ICE. PHASE 2: TEST RESULTS
Gordon F. N. Cox, Jacqueline A. Richter-Menge, Wilford F. Weeks, Hazen Bosworth, and Nancy Perron Oct. 1985 84 p
(AD-A166333; CRREL-85-16) Avail: NTIS HC A05/MF A01 CSCL 08/12
This report presents the results of the second phase of a test program designed to obtain a comprehensive understanding of the mechanical properties of multi-year sea ice from the Alaskan Beaufort Sea. In Phase II, 62 constant-strain-rate uniaxial compression tests were performed on horizontal and vertical ice samples from multi-year pressure ridges to examine the effect of sample orientation on ice strength. Also conducted were 36 constant-strain-rate tension tests, 55 conventional triaxial tests and 35 constant-load compression tests on multi-year pressure ridge samples to provide data for developing ice yield criteria and constitutive laws. Data are presented on the strength, failure strain and modulus of multi-year sea ice under different loading conditions. The effects of ice temperature, porosity, structure, strain rate, confining pressure and sample orientation on the mechanical properties of multi-year sea ice are examined. GRA

THE STABILITY OF LOW-LATITUDE SEA-SURFACE TEMPERATURES: AN EVALUATION OF THE CLIMAP RECONSTRUCTION WITH EMPHASIS ON THE POSITIVE SST ANOMALIES
Warren L. Prell Jul. 1985 53 p
(Contract DE-AC02-83ER-60167)
(DE85-016190; DOE/ER-60167/1) Avail: NTIS HC A04/MF A01
A global data base of species composition of planktonic foraminifera has been compiled from sea floor samples (NS=1-145). This database has been used to evaluate the CLIMAP (1981) paleotemperature estimates and as the basis for an alternative method of estimating past sea surface temperatures: the modern analog technique (MAT). Evaluation of the CLIMAP foraminiferal equations reveals that they generaly do not work well on oceans not included in their calibration database and that some Pacific estimates may be biased toward warm values. The MAT estimates of SST are shown to be similar or higher correlation coefficients and to have lower standard estimates of errors than the comparable CLIMAP equations. Application of both methods to the 18K data results in positive SST anomalies in the south central Pacific and western tropical Indian Ocean. This comparison indicates that the positive SST anomalies of the CLIMAP reconstruction are real and do not reflect methodological bias. DOE

LIFE SCIENCES SPACE STATION PLANNING DOCUMENT: A REFERENCE PAYLOAD FOR THE LIFE SCIENCES RESEARCH FACILITY
Aug. 1986 132 p
(NASA-TM-89188; NAS 1.15:89188) Avail: NTIS HC A07/MF A01 CSCL 06B
The Space Station, projected for construction in the early 1990s, will be an orbiting, low-gravity, permanently manned facility providing unprecedented opportunities for scientific research. Facilities for Life Sciences research will include a pressurized

research laboratory, attached payloads, and platforms which will allow investigators to perform experiments in the crucial areas of Space Medicine, Space Biology, Exobiology, Biospherics and Controlled Ecological Life Support System (CELSS). These studies are designed to determine the consequences of long-term exposure to space conditions, with particular emphasis on assuring the permanent presence of humans in space. The applied and basic research to be performed, using humans, animals, and plants, will increase our understanding of the effects of the space environment on basic life processes. Facilities being planned for remote observations from platforms and attached payloads of biologically important elements and compounds in space and on other planets (Exobiology) will permit exploration of the relationship between the evolution of life and the universe. Space-based, global scale observations of terrestrial biology (Biospherics) will provide data critical for understanding and ultimately managing changes in the Earth's ecosystem. The life sciences community is encouraged to participate in the research potential the Space Station facilities will make possible. This document provides the range and scope of typical life sciences experiments which could be performed within a pressurized laboratory module on Space Station. Author

THE TEMPORAL RESPONSE OF BONE TO UNLOADING

Ruth K. Globus, Daniel D. Bikle (California Univ., San Francisco.), and Emily Morey-Holton 19 Dec. 1984 34 p Prepared in cooperation with Veterans Administration Hospital, San Francisco, Calif.

(Grant NAGw-236)

(NASA-TM-89228; NAS 1.15:89228) Avail: NTIS HC A03/MF A01 CSCL 06P

Rats were suspended by their tails with the forelimbs bearing the weight load to simulate the weightlessness of space flight. Growth in bone mass ceased by 1 week in the hindlimbs and lumbar vertebrae in growing rats, while growth in the forelimbs and cervical vertebrae remained unaffected. The effects of selective skeletal unloading on bone formation during 2 weeks of suspension was investigated using radio iostope incorporation (with Ca-45 and H-3 proline) and histomorphometry (with tetracycline labeling). The results of these studies were confirmed by histomorphometric measurements of bone formation using triple tetracycline labeling. This model of simulated weightlessness results in an initial inhibition of bone formation in the unloaded bones. This temporary cessation of bone formation is followed in the accretion of bone mass, which then resumes at a normal rate by 14 days, despite continued skeletal unloading. This cycle of inhibition and resumption of bone formation has profound implication for understanding bone dynamics durng space flight, immobilization, or bed rest and offers an opportunity to study the hormonal and mechanical factors that regulate bone formation. THERMOREGULATION AFTER ATROPINE AND PRALIDOXIME ADMINISTRATION

Margaret A. Kolka, Lou A. Stephenson, Stephen P. Bruttig, Bruce S. Cadarette, and Richard R. Gonzalez Mar. 1986 19 p

(AD-A165868) Avail: NTIS HC A02/MF A01 CSCL 06/15

The effects of intramuscular saline (control), atropine (2mg), pralidoxime (600 mg) or a combination of the two drugs on heat exchange was evaluated in four healthy males during moderately intense seated, cycle exercise (55% v02 peak) in a temperate environment (T sub a = 30.3 C, P sub W = 1.0 kPa). Esophageal, rectal, and mean skin temperatures, and chest and forearm sweating were continuously measured. Skin blood flow (FBF) from the forearm was measured twice each minute by venous occulusion plethysmography. Whole body sweating was calculated from weight changes. The expected result of atropine injection, decreased eccrine sweating (-60%, P 0.05) with ensuent elevated esophageal (+0.4C, $P<0.05$) and skin temperature (+2.1C, $P<0.05$) was observed relative to control. Heart rate (+28 b/min) and FBF (+9 ml/100cc) were higher after atropine. Pralidoxime, in general, did not affect the core and skin temperature responses to the exercise differently from control; however, a slightly elevated FBF (+3ml/100cc min, 33%) compensated for the reduction in whole body sweating (-45%, $p<0.05$) that we observed. The combination of the drugs resulted in significantly higher esophageal (0.4C) and skin (0.9C) temperatures than atropine alone, as has been previously shown. The thermoregulatory disadvantage of inhibited sweating by atropine was partially compensated for by enhanced skin blood flow in this environment where T sub a>T sub sk. Pralidoxime was shown to decrease whole body sweating, by a mechanism as yet unexplained. GRA

N86-30305# Army Research Inst. of Environmental Medicine, Natick, Mass.

HUMAN VASCULAR FLUID RESPONSES TO COLD STRESS ARE NOT ALTERED BY COLD ACCLIMATION

Andrew J. Young, Stephen R. Muza, Michael N. Sawka, and Kent B. Pandolf Mar. 1986 26 p

(AD-A165869; USARIEM-M-19/86) Avail: NTIS HC A03/MF A01 CSCL 06/19

Repeated cold water immersion can induce the development of an insulative type of cold acclimation in man. This investigation determined if repeated cold water immersion produced changes in vascular fluid response to cold stress in addition to the previously reported changes in thermoregulation. Seven male subjects performed a standardized cold air and cold water exposure before and again after a cold acclimation program. The cold acclimation program consisted of daily immersion (90 min) in cold water (18 C, stirred) repeated five times per week for five consecutive weeks. Cold acclimation did not alter the responses of plasma volume or electrolyte concentrations, nor urinary flow or electrolyte excretion during either cold air or cold water exposure. The percent reduction in plasma volume was larger ($P<0.01$) in cold water (-17%) than in cold air (-12%). Cold water immersion resulted in greater ($P<0.01$) diuresis than cold air exposure. Plasma K(+) concentration increased ($P<0.01$) during cold (both air and water) exposure while plasma Na(+) concentration was unchanged. Calculated renal clearance and urinary excretion rate of both Na(+) and K(+) increased during cold (both air and water) exposure. It is concluded that: (1)insulative cold acclimation does not influence vascular fluid responses to cold stress; and (2)although vascular fluid shifts, body cooling and diuresis are all greater in cold water than air, a consistent relationship among these parameters could not be established for an individual's response. GRA

CALCIUM AND VITAMIN D METABOLISM IN SUBMARINERS: CARBON DIOXIDE, SUNLIGHT AND ABSORPTION CONSIDERATIONS

David M. Sack, M. Holick, and K. R. Bondi 15 Jan. 1986 25 p

(AD-A166292; NSMRL-1037) Avail: NTIS HC A02/MF A01 CSCL 06/16

A 42% decrease in 25(OH)vitamin D levels has been noted in subjects over the course of submarine patrols and is thought to be the result of prolonged sunlight deprivation. The influence of the submarine environment on absorption of ingested vitamin D has not been previously investigated. This study examines the vitamin D absorption patterns of 5 subjects at the beginning, middle, and end of a 89 day patrol on a normal diet and with no exposure to sunlight. It was found that the magnitude and pattern of absorption does not change appreciably. It is concluded that the absorption of vitamin D is not affected by the submarine environment and that any drop in 25(OH) vitamin D levels seen during patrol is caused by lack of sunlight, ultraviolet light in particular. Implications in terms of sunlight deprivation and calcium metabolism

are discussed in a historical review of calcium and vitamin D investigations on submarines. GRA

N86-30307# Army Research Inst. of Environmental Medicine, Natick, Mass.
AN ENVIRONMENTALLY-CONTROLLED EXTENDED-USE SMALL ANIMAL HYPOBARIC CHAMBER
James A. Devine and Allen Cymerman Apr. 1986 14 p
(AD-A166729; USARIEM-M-23/86) Avail: NTIS HC A02/MF A01 CSCL 06/19

An environmentally-controlled extended-use small animal hypobaric chamber has been designed to study small laboratory animals at low barometric pressures for long periods of exposure. The rectangular chamber (91.4 x 71.1 x 50.8 cm) is constructed of aluminum plate and acrylic resin with a volume of 330,000 cc. A computer/data acquisition control unit provides for controlling and collecting data on pressure, temperature, and relative humidity (RH) for sustained operations. Altitude simulation is achieved using a two-stage, air-cooled vacuum pump with a displacement of 30 cc/min. The pressure within the chamber is controlled by an incremental throttling valve in the vacuum line. Temperature (0-100 C) is accomplished by using a remote-controlled constant temperature circulating bath. RH (20-80%) is regulated by pre-conditioning the ventilation purge air prior to entering the chamber. Acceptable levels of oxygen and carbon dioxide gases are maintained by purging with sufficient volumes of fresh air. GRA

MULTIPARAMETER DATA ACQUISITION SYSTEMS FOR STUDIES OF CIRCADIAN RHYTHMS
K. R. Groh, C. F. Ehret, W. J. Eisler, Jr., and D. A. LeBuis 1985 15 p Presented at the NATO Advanced Workshop on Chronobiotechnology, Cardiff, Wales, 21 Apr. 1985
(Contract W-31-109-eng-38)
(DE86-004041; CONF-8504206-1) Avail: NTIS HC A02/MF A01

Long-term, simultaneous monitoring of multiple metabolic circadian cycles such as energy metabolism, animal activity, and body temperature together have revealed ultradian fine-structure rhythms which are dependent on circadian phase and the perturbations of environmental influences. Because of the variation between individual animals, these experiments need to have large sample sizes for each experimental condition. To this end we have designed, constructed, and used four microcomputer controlled data acquisition systems to collect circadian data from individually housed rats and mice. DOE

MEDICAL SELECTION AND PHYSIOLOGICAL TRAINING OF FUTURE FIGHTER AIRCREW
Loughton, England Dec. 1985 146 p refs In ENGLISH and FRENCH Conference held in Athens, Greece, 25-26 Apr. 1985
(AGARD-CP-396; ISBN-92-835-0385-6) Avail: NTIS H A07/MF A01

The conference proceedings reviewed and made recommendations with respect to the medical selection and physiological and physical training of pilots who are to operate future fighter aircraft. The relevant characteristics of a proposed USAF fighter and the European Fighter Aircraft were discussed and used as the basis for selection and training considerations. Contributors drew upon the experience of the medical selection of pilots for present fighter aircraft. The cardiovascular, vision, and vertebral column aspects of medical selection and monitoring are considered in depth and recommendations made as to the methods which should be employed in the future. The influence of physical fitness upon pilot performance is addressed. The philosophy and practice of physiological training of aircrews is reviewed with emphasis on the value of the human centrifuge in teaching G protective maneuvers. For individual titles, see N86-30310 through N86-30327.

AIRCREW ASPECTS OF UNITED STATED FUTURE FIGHTER AIRCRAFT
Richard D. Krobusek *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 5 p (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

The cockpit environment of fighter aircraft for the year 2000 and beyond will undoubtedly need aircraft technologies and protective devices to meet the ever growing enemy challenge. Recent advances in aircraft structures, flight controls, sensors, multipurpose and touch-sensitive displays, voice recognition and synthesis, enemy defenses, and chemical/biological warfare (CBW) technologies will combine to create a cockpit environment for future fighter aircraft vastly different and potentially more complex than any previously encountered by aircrews. This integration of equipment and crewmembers will interact such that new stresses will be created and existing ones aggravated. Special maneuver capability through the use of direct side force may provide significant tactical advantage at the expense of stress due to lateral acceleration forces. A few of these current technolooies and some of the driving forces which will affect the cockpit environment of tomorrow's aircraft will be identified and discussed briefly. These technologies, as well as others, should receive further study for their effects on the aircrew prior to application in future aircraft. Proper application of the results of these studies will prevent the unbridled growth of cockpit complexity. Author

CANADIAN FORCES APPROACH TO AIRCREW MEDICAL SELECTION
Gary Gray *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 6 p (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

With advances in aircraft performance capabilities and in medical screening technology, major changes in Canadian Forces aircrew medical screening procedures were proposed and are being introduced. In addition to the standard battery of tests, additional screening procedures being introduced or evaluated include drug screening for cannabinoids, contrast sensitivity function visual assessment, echocardiograms, cardiovascular risk assessment, pulmonary function testing, an aeromedical history questionnaire, and a psychosocial and clinical review by a flight surgeon. Screening electroencephalograms are being continued. This data is used to reject candidates who fail to meet slection standards, and to provide a Medical Suitabiliyt Rating for acceptable candidates. Of candidates screened 2.8% had positive tests for urinary cannabinoids. Contrast sensitivity norms for the aircrew candidate population are higher than for other populations studied. Contrast sensitivity may be helpful in assessing candidates whose vision is close to standards. This approach to initial medical screening should reduce attrition of experienced aircrew for medical reasons, and will enhance flight safety over the years to come. Author

N86-30312# Tactical Air Command, Langley AFB, Va.
MEDICAL SELECTION AND PHYSIOLOGICAL TRAINING OF FIGHTER PILOTS: A 1985 PERSPECTIVE AND OVERVIEW
Rufus M. DeHart *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 5 p (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

From an aeromedical perspective, there are two major goals for the Tactical Air Force. The first is to reduce the aircraft mishap rate due to human factor variables. The second is to enchance pilot capability to perform in the modern fighter environment. Fighter pilots can perform in the 9G (sub z) environment effectively and safely if they are properly selected, educated, and trained. In addition to being good aviators, smart, and aggressive, fighter pilots must be physically healthy and in excellent physical condition.

A thorough understanding of high-G physiology and the personal physiological flight envelope is needed. Accomplishing the variety of initiatives required to realize these goals is an exciting challenge for the aerospace medical community. Author

CARDIOVASCULAR STANDARDS FOR SELECTION AND RETENTION OF HIGH PERFORMANCE PILOTS IN THE USAF: PERSPECTIVES FOR THE NEXT DECADE
James R. Hickman, Jr., George M. McGranahan, Jr., Robert M. Paull, and Rufus M. DeHart (Tactical Air Command, Langley AFB, Va.) *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 7 p (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

Cardiovascular selection and retention standard must be based upon a number of considerations which are primarily epidemiological in nature. In young applicants, there is little rationale in the performance of expensive, labor intensive studies which yield nonspecific results, most of which are normal variants. Stress tests and Holter monitors fall into this category. Since the significance of nonspecific findings is determined by the presence or absence of underlying organic structural defects, it is recommended that testing in a young population be directed toward the detection of anatomical defects. It is also recommended that abnormal findings of a structural nature then be assessed with functional tests to determine whether the applicant may enter some form of aviation training or be disqualified from all training. SELECTION AND MEDICAL TESTING OF MIRAGE 2000 PILOTS: REPORT OF ECHOCARDIOGRAPHY [SELECTION ET SURVEILLANCE MEDICALES DES PILOTES DE MIRAGE 2000: APPORT DE L'ECHOCARDIOGRAPHIE]
H. Ille, A. Didier, N. Allegrini, and C. Maurel *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 13 p In FRENCH (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

The use of echocardiological examinations in the selection of prospective combat aircraft crews is discussed. Included is a comparative study of two homogeneous pilot cohorts; one consists of 54 transport aircraft pilots, and the other consists of 32 combat pilots. It is shown that the two cohorts present the same anomalies of the right cardiac region (mitral valvular prolapsus). However, it is shown that the anomalies of the right cardiac region form a right ventricular dilation only in combat pilots. Two hypotheses were developed: that the anomalies are an adaptation of the right cardiac region to accelerations, or that they are a stage preceeding secondary myocardial shock due to aeronautical constraints. CONTINUOUS ECG MONITORING OF MIRAGE 2000 PILOTS (COMPARISON WITH MIRAGE 3 AND F1 PILOTS) [ENRIGISTREMENT CONTINU DE L'E.C.G. CHEZ LES PILOTES DE MIRAGE 2000 (COMPARAISON AVEC LES PILOTES DE MIRAGE 3 ET F1)]
A. Seigneuric, G. Leguay, J. P. Burlaton, G. Poyot, and M. Sylvestre *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 3 p In FRENCH (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

Continuous Electrocardiographic monitoring for a duration of 24 hours allows a comparison of a sample of 24 conventional combat aircraft pilots (Mirage III and FI), with 7 Mirage 2000 pilots. A comparison of problems due to excitability during flight does not show signification differences among the two groups. Problems due to solar repolarization were recorded only for high-performance aircraft pilots. Differences primarily included cardiac frequencies in flight; they were clearly lower for the Mirage 2000 pilots as observed acceleration was increased. This corresponds with the differences in characteristics of the two populations, pertaining to the different missions. It is shown that modern combat aircraft, characterized by intense and prolonged acceleration, are capable of causing a certain excitability factor for the pilots. It is important to determine the influence of this acceleration on the cardiovascular system. B.G.

THE USE OF ECG CHANGES CAUSED BY ACCELERATION AS TOLERANCE PREDICITION FACTORS [LES MODIFICATIONS ELECTROCARDIOGRAPHIQUES INDUITES PAR LES ACCELERATIONS, FACTEUR PREDICTIF DE LA TOLERANCE]
J. H. Clere, H. Vielleford, and J. L. Poirier *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 7 p In FRENCH (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

High-G accelerations experienced by combat aircraft pilots are arythmogenic. Of 328 electrocardiographic (EKG) tests done on 146 subjects submitting to accelerations of 4 to 11 G at a duration of 20 to 60 seconds, 215 supraventricular anomalies were observed on 181 tests, and 37 ventricular anomalies were observed on 31 tests. The frequency of these anomalies are a function of the intensity of the acceleration. However, there appeared to be no correlation between the EKG anomalies and the hemodynamic phenomena caused by problems of visual function or psychomotor problems. Thus it is stated that EKG monitoring may be of interest for use as a prediction factor for acceleration tolerance. It is stated that the anomalies of rhythm are probably based on vagus reflexes caused by attempts by the heart to protect against the acceleration, as well as by the venous responses to the centrifuge. ENTRY VISUAL STANDARDS AND OCULAR EXAMINATION TECHNIQUES FOR FUTURE FIGHTER AIRCREW
D. H. Brennan *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 6 p (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

The visual tasks of future fighter aircrew are likely to increase both in magnitude and complexity. The increasing adoption of devices for visual enhancement and protection, even now, poses problems for integration with spectacles. The visual standards required for initial selection for training as a pilot or navigator should, if numbers permit, be such that trained aircrew are unlikely to require a visual aid until presbyopia physiologically demands correction in the latter half of the fourth decade. The visual standards considered appropriate for future fighter aircrew and the related ocular examination techniques both conventional and those designed to test such specialized ocular functions as stereopsis, glare resistance, dark adaptation, hue discrimination, and modulation transfer function are discussed. SENSITIVITY TO COLOR CONTRASTS AND THE SELECTION OF NAVIGATOR PERSONNEL [SENSIBILITE AU CONTRASTE EN COULEURS ET SELECTION DU PERSONNEL NAVIGANT]
J. P. Menu, G. Santucci, and C. Corbe *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 8 p In FRENCH (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

Using a specific psychophysical method, the sensitivity to color contrasts (FSC) was systematically tested for subjects undergoing ophthalmological examinations. Following FSC examinations, several subjects with ametrophic conditions were studied. The FSC examinations were modified to obtain the exact nature of the ophthalmological I problem. It is shown that there is a change in the spatial frequencies of the blue section for subjects with myopic disorders, and a change in the red section for far-sighted subjects. This change is shown to be proportional to the degree of

ametrophic disorder. Thus, FSC tests are proposed as a basis for tests for the selection of navigators. B.G.

COMPUTER ANALYSIS OF VISUAL AND VESTIBULAR OCULOMOTOR FUNCTION IN THE MEDICAL SELECTION OF FIGHTER AIRCREW MEMBERS
James W. Wolfe, Edward J. Engelken, and Kennith Stevens, W. *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 6 p (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

Methods for evaluating visual and vestibular-oculomotor function in aircrew members are reviewed. Three specific tests are described: pursuit tracking, harmonic angular acceleration, and saccadic tracking. In all of these tests, on-line computer analysis is used to quantify and describe the input/output relationships. An example of clinical data from pursuit tracking and harmonic angular acceleration tests for a patient with known pathology are used to demonstrate changes in test results. The major point is that it is now practical to evaluate oculomotor function in pilots and aircrew members selected for fighter aircraft duty. Author

VISUAL CAPABILITIES RELATED TO FIGHTER AIRCREW PERFORMANCE IN THE F-14 AND ADVERSARY AIRCRAFT
W. A. Monaco and P. V. Hamilton *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 9 p (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

Standards for aviation personnel should be based on capacities for performing critical tasks. The use of scores on task-relevant visual tests to predict air-to-air target detection performance of pilots involved in air combat maneuver (ACM) training was determined. A series of automated vision tests was determined in a mobile field laboratory located at a Tactical Air Combat Training System (TACTS) range. A computerized telemetry network provides extensive real time data on observer and target aircraft flight dynamics, and environmental parameters. A pilot's performance on each ACM engagement was measured by the slant range at the instant he sighted a target aircraft. Priminary analyses show that about 30% of the variance in the slant range is accounted for by flight dynamics, and environmental parameter, and vision data. Author

VISION TEST BATTERY THRESHOLD AND RESPONSE TIME AS PREDICTORS OF AIR-TO-AIR VISUAL TARGET ACQUISITION IN F-14 AND ADVERSARY AIRCRAFT
A. Morris, P. V. Hamilton, W. A. Morey, and R. P. Briggs (University of Southern California, Los Angeles.) *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 8 p (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

The Naval Aerospace Medical Research Laboratory (NAMRL) Vision Test Battery provides assessment of various visual functions, including spot detection, acuity at high and low contrast, glare sensitivity, and accommodative flexibility. Within these tests are measures of threshol, threshold-stressed response time (for near-threshold stimuli), and unconfounded response time (for supra-threshold stimuli). The contribution of response time variables to predicting flight performance was evaluated for 73 fighter pilots. Vision test data were compared to performance in air combat maneuver training. The distance (slant range) between the observer and target aircraft at time of initial visual detection was used as the performance variable. Availability of response time variables enhanced the ability to predict the air-to-air visual target detection performance of these pilots. Four vision variables accounted for about 32% of the variance in performance of those pilots who detected target aircraft at slant ranges greater than the group average. Prediction of performance is improved by incorporating other vision data and additional refinement of the performance measure. Author

THE VERTEBRAL COLUMN: SELECTION AND APTITUDE OF COMBAT AIRCRAFT PILOTS OF THE FUTURE [COLONNE VERTEBRALE: SELECTION ET APTITUDE DES PILOTES D'AVION DE COMBAT DU FUTUR]
P. J. Metges, J. Flageat, R. Aufret, R. P. Delahaye, and H. Vieillefond *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 3 p In FRENCH (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

The new generation of combat aircraft is characterized by the possibility of negative effects on the vertebral column due to extended or peak acceleration forces. In order to provide the pilot with optimal capacity for visual information assimilation, the cervical rachis must remain mobile and is therfore vulnerable under certain circumstances. Lesions may occur in this area during flight. Prevention of this condition is based on three elements: extensive radiological examination of the rachis for pilot applicants; technical improvements in helmet alignment; and physical adaptation training. B.G.

SYSTEMATIC RADIOGRAPHIC EXAMINATION OF THE SPINE FOR SELECTION OF F-16 PILOTS: A PRELIMINARY REPORT
Albert vanDalen and Harry H. M. VanDenBiggelaar (Royal Netherlands Air Force, Soesterberg.) *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 4 p (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

With the introduction of the high performance aircraft F-16 in the Royal Netherlands Air Force an increase in spinal column disorders was anticipated. Therefore, a systematic whole spine radiography of candidate student pilots (CSPs) and qualified pilots (QPs) designated to fly F-16 were performed since December 1982. To reduce radiation exposure radiographs were made using a modern 14 inch intensifier. So far, 225 CSPs and 196 QPs were examined. Strict application of the medical criteria leads to a rejection of 20% of the CSPs because of spinal disorders visualized on X-ray. For F-16 pilots, the major region of interest seems to be the cervical spine. The rejection rate could be reduced by readjustment of the medical criteria and separate selection of helicopter and fighter pilots. Systematic examination of QPs who had no or incomplete previous examinations uncovers a high rate of spinal disorders. In the series QPs without any symptoms were only rejected because of cervical discopathy with osteophyte formation on the backside of the vertebrae and resulting narrowing of the spinal canal. PHYSICAL TRAINING OF MIRAGE 2000 PILOTS [ENTRAINEMENT PHYSIQUE DES PILOTES DE MIRAGE 2000]
G. Poyot, J. M. Clere, J. Lemot, and J. P. Delattre *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 5 p In FRENCH (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

Nine combat aircraft pilots underwent physical training specifically designed to increase their tolerance to acceleration forces. The suitability of the training was studied using centrifuge tests. The increase in tolerance could be attributed to the effects of the physical training or to an adaptation to the centrifuge. It is shown that together with an excellent original physical condition, specific physical training may increase the tolerance of acceleration forces. Further testing of this is expected. B.G.

TREADMILL SPIROERGOMETRY IN THE SELECTION AND SCREENING OF HIGH-PERFORMANCE COMBAT AIRCRAFT

PILOTS IN THE BELIGAN AIR FORCE [SPIROERGOMETRIE SUR TAPIS ROULANT DANS LA SELECTION ET LA SURVEILLANCE DES PILOTES D'AVIONS A HAUTES PERFORMANCES DE LA FORCE AERIENNE BELGE]
G. Pirquin, J. Vastesaeger, and P. Vandenbosch *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 5 p In FRENCH (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

All pilots of the Belgian Air Force who were designated for conversion to the F-16 aircraft underwent cardiovascular and respiratory examinations. One of the tests was a test for maximum treadmill effort. In the first study, the results of the screening were combined with the results of tests conducted on a group of young candidate student pilots. The aerobic capacity of this population was then evaluated. The test sample included 156 persons of various ages and in different stages of physical conditioning. In the second study, the positive effects of physical training on the treadmill spiroergometric examination of a group of F-16 pilots were examined. B.G.

RELATIONSHIP OF CARDIOPULMONARY FITNESS TO FLIGHT PERFORMANCE IN TACTICAL AVIATION
G. R. Banta and J. D. Grissett *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 11 p (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

Current endeavors to identify whether cardiopulmonary fitness can positively influence flight performance in a tactical fighter community are discussed. Population analyses of experienced and student Naval aviators present evidence that the U. S. Navy aviation pilot community is in an above the average state of physical fitness with less than average coronary heart disease potential. Correlations found between cardiopulmonary fitness and psychophysiological responses that occur during simulated and/or actual flight operations present strong ecidence that flight performance could be favorably affected. HYPOBARIC TRAINING OF FLIGHT PERSONNEL WITHOUT COMPROMISING QUALITY OF LIFE
Don Montelle Herron *In* AGARD Medical Selection and Physiological Training of Future Fighter Aircrew Dec. 1985 7 p (For primary document see N86-30309 21-52)
Avail: NTIS HC A07/MF A01

The increased incidence in decompression sickness during physiology training among U. S. Navy aircrew personnel and medical attendants requires a search for alternative means of permitting recognition and corrective action of hypoxia. The requirement for individual hypoxia training is considered valid not just by Navy regulations but by aeromedical practioners throughout the world. A proposal is made to utilize a gas mixture consisting of 7.4% oxygen and 92.6% nitrogen to induce hypoxia at ground level. This would permit ground level hypoxia training with similar symptoms of hypoxia as presently demonstrated at 25,000 feet in a decompresion chamber but would alleviate the primary cause of decompression sickness. All other U. S. Navy training objectives for the chamber exposure would be safely met and more efficiently demonstrated. The initial financial burden in modifying the existing decompression training chamber would be moderate when considering development and manufacturing of a new training device. The ultimate gain exists in decreased human suffering and the necessary return of credibility to the aeromedial training community. This is a must if we are to profess to do no harm. Author

DIVISION OF ATTENTION AS A FUNCTION OF THE NUMBER OF STEPS, VISUAL SHIFTS, AND MEMORY LOAD
Richard A. Chechile (Tufts Univ., Medford, Mass.), Keith Butler, William Gutowski, and Everett A. Palmer 1986 11 p
(Contract NCA2-OR785-801)
(NASA-TM-88775; NAS 1.15:88775) Avail: NTIS HC A02/MF A01

The effects on divided attention of visual shifts and long-term memory retrieval during a monitoring task are considered. A concurrent vigilance task was standardized under all experimental conditions. The results show that subjects can perform nearly perfectly on all of the time-shared tasks if long-term memory retrieval is not required for monitoring. With the requirement of memory retrieval, however, there was a large decrease in accuracy for all of the time-shared activities. It was concluded that the attentional demand of longterm memory retrieval is appreciable (even for a well-learned motor sequence), and thus memory retrieval results in a sizable reduction in the capability of subjects to divide their attention. A selected bibliography on the divided attention literature is provided. Author

THE EFFECT OF SPECTRALLY SELECTIVE FILTERS ON VISUAL SEARCH PERFORMANCE Final Report
G. T. Chisum, J. B. Sheehy, P. E. Morway, and G. K. Askew 8 Aug. 1985 17 p
(AD-A165835; NADC-85115-60) Avail: NTIS HC A02/MF A01 CSCL 06/16

The effect of five spectrally selective filters on the performance of an acuity dependent visual search task was evaluated. The filters were: (A)a neutral density filter (control condition); (B)a 52 00A green interference filter; (C)a 3215-250 red filter; (D)a neodymium visor; and (E)a holographic filter. The observers were presented with five blocks of ten slides per filter. Each slide projected a 6 by 6 deg field of 900 ten min of arc letter Os which contained a single Landolt C. The observers were required to search the field and report the orientation of the opening in the C. The opening in the C, which subtended 2.64 min of arc, required an acuity of 0.39 for detection. Response time, error rate, accommodative accuracy, and the number of fixations and their duration were recorded for each slide presentation. The results demonstrate that filter type had no effect on any of the response measures. During the first three trial blocks the observers appeared to optimize their search strategies, after which they began to revert to their initial performance levels. Although this effect was not supported statistically, this trend indicates that initially search proficiency increases with practice after which it is offset by fatigue. GRA

THE IMPORTANCE OF SPECIALIZED COGNITIVE FUNCTION IN THE SELECTION OF MILITARY PILOTS
Harold W. Gordon and Robert Leighty 19 Mar. 1966 43 p
(Contract N00014-83-K-0208)
(AD-A165889) Avail: NTIS HC A03/MF A01 CSCL 05/10

Visuospatial skills significantly distinguished student Naval aviators who dropped out of aviation training from those who received their wings. While both groups were better than average on these tests, the winged aviators were better than the dropout group by 0.25 standard deviation which is highly significant ($P<0.0001$) for the total sample of 600 subjects. Performance on verbal-sequential skills did not distinguish between the groups. Logistic regression not only confirmed the group difference but demonstrated an interaction with verbal-sequential skills. High

performance on these skills helped the odds of being winged for aviators with low visuospatial ability but hindered those with high visuospatial ability. Distribution of visuospatial scores for the 2 groups demonstrated reasonable cut-off points at which considerably more drop-outs than winged aviators could have been eliminated. However, these data are relevant only for the selected sample of aviators accepted for the training programs. An additional study on the entire group of applicants including those rejected would allow comparison between the special cognitive tests used in this study and those already used as selection criteria. SPATIOTEMPORAL CHARACTERISTICS OF VISUAL LOCALIZATION Final Report, 1 Jun. 1982 - 31 Aug. 1985
Christina A. Burbeck 30 Oct. 1985 21 p
(Contract F49620-82-K-0024)
(AD-A166097; AFOSR-86-0109TR) Avail: NTIS HC A02/MF A01 CSCL 20/6

The main thrust of this research effort has been investigation of the spatial and temporal properties of the visual processes underlying relative spatial localization by human observers. The initial tasks were development of a suitable laboratory display system for generating the required stimuli, and development of appropriate experimental paradigms for studying the localization of widely separated objects. The second task was to make careful quantitative measurements of the spatial and temporal properties of the system underlying localization of widely separated objects. It was found that many of the stimulus manipulations that are critical in determination of contrast detection thresholds have little or no effect on localization accuracy. The relative localization of widely separated objects is a highly robust visual ability. Those variations in localization accuracy with changes in the spatial and temporal parameters of the stimulus that were obtained could readily be modeled as natural extensions of the threshold properties. The final task of this project was testing of existing models of spatial ability that can be accounted for by current models of spatial vision. Specific extensions of the existing model were suggested by the data. GRA

AN INVESTIGATION OF THE USE OF STEADY-STATE EVOKED POTENTIALS FOR HUMAN PERFORMANCE AND WORKLOAD ASSESSMENT AND CONTROL Final Technical Report, 15 Jun. 1983 - 14 Jun. 1985
Samuel L. Moise, Jr. Jun. 1985 66 p
(Contract F49620-83-C-0102)
(AD-A166205; AFOSR-86-0110TR) Avail: NTIS HC A04/MF A01 CSCL 05/10

This program of research investigated Steady-State Evoked Potential (SSEP) measures to determine their utility for evaluating sensory inputs, workload, and performance variables in human operators. A primary purpose was to find techniques and measures that could be generalized to groups of subjects in operational environments. SSEP measures included power (amplitude), coherence, phase lag, and Relative Transmission Time (RTT). Included in this effort were studies of: (1) Frequency masking, where multiple frequencies were presented simultaneously. (2) Sensory inputs which may manipulate SSEP (e.g., color, intensity, cross-modality stimulation). (3) Correlation of SSEP measures with fatigue and tack difficulty. (4) The relationship between performance in a tracking task and SSEP measures. GRA

THE EFFECTS OF COLOR-CODING IN GEOSIT (GEOGRAPHICAL SITUATIONAL) DISPLAYS. 2: REDUNDANT VERSUS NON-REDUNDANT COLOR-CODING Interim Report
Alan R. Jacobsen, William H. Rogers, and David F. Neri 15 Jan. 1986 26 p
(AD-A166263; NSMRL-1069-2) Avail: NTIS HC A03/MF A01 CSCL 05/8

The effect on search time of redundant versus non-redundant color-coding of symbols in geographical situational (GEOSIT) displays was evaluated using 36 observers who were randomly assigned to three coding schemes: monochrome-coding, redundant color-coding, and non-redundant color-coding. In the color-coding schemes, only the threat information (Friendly, Unknown, and Hostile) was color coded, either redundantly with shape or not. The platform information (Submerged, Surface, and Airborne) was coded by shape in all three coding schemes. Performance when searching for the color-coded threat target categories was enhanced by over 100% compared to monochrome shape-coding. In addition, response time on the non-color-coded platform categories was significantly faster under the non-redundant color-coding scheme than under the redundant color-coding scheme. Author (GRA)

ATTENTION TASKS AND THEIR RELATION TO AGING AND FLIGHT EXPERIENCE
L. C. Boer Feb. 1986 28 p
(Contract A83/KLu/078)
(IZF-1986-4; TDCK-86-0585; ESA-86-97400) Avail: NTIS HC A03/MF A01

The Dichotic Listening Task (DLT) of Gopher and Kahneman (1971) was studied in a group of 143 aviators, aged between 17 and 70 yr. Other tasks of the study were the Continuous Memory Task (CMT) and two choice-RT tasks with visual stimuli. An attention questionnaire was also administered. Aging has negative effects on all tasks, especially on the DLT. With age factored out, no substantial correlations between DLT and other tasks are found. The only exception is a moderate correlation with choice RT. Differences between subgroups of aviators (42 airline pilots and

50 private pilots) were studied. The assumption was that airline pilots had higher levels of aviator skill. The DLT, CMT, and one of the RT tasks correlate with aviator subgroup. A second study with 16 flight cadets finds significant correlations between DLT and RT tasks on the one hand, and pilot gradings obtained later. It is concluded that DLT and RT tasks offer prospects for improving the selection of aviators. ESA

IMPLICATIONS OF PRIVACY NEEDS AND INTERPERSONAL DISTANCING MECHANISMS FOR SPACE STATION DESIGN Progress Report, Jul. - Aug. 1985
Albert A. Harrison, Robert Sommer, Nancy Struthers, and Kathleen Hoyt 30 Aug. 1985 26 p
(Grant NAG2-357)
(NASA-CR-176938; NAS 1.26:176938) Avail: NTIS HC A03/MF A01 CSCL 05H

Privacy needs, or the need of people to regulate their degree of contact with one another, and interpersonal distancing mechanisms, which serve to satisfy these needs, are common in all cultures. Isolation, confinement, and other conditions accociated with space flight may at once accentuate privacy needs and limit the availability of certain common interpersonal contact. Loneliness occurs when people have less contact with one another than they desire. Crowding occurs when people have more contact with one another than they desire. Crowding, which is considered the greater threat to members of isolated and confined groups, can contribute to stress, a low quality of life, and poor performance. Drawing on the general literature on privacy, personal space, and interpersonal distancing, and on specialized literature on life aboard spacecraft and in spacecraft-analogous environments, a quantitative model for understanding privacy, interpersonal distancing, loneliness, and crowding was developed and the practical implications of this model for space station design were traced. SPECIFICATIONS PHYSIOLOGICAL MONITORING SYSTEM
15 Jul. 1985 73 p
(Contract NAS9-16811)
(NASA-CR-171926; NAS 1.26:171926) Avail: NTIS HC A04/MF A01 CSCL 06B

The operation of a physiological monitoring system (PMS) is described. Specifications were established for performance, design, interface, and test requirements. The PMS is a compact, microprocessor-based system, which can be worn in a pack on the body or may be mounted on a Spacelab rack or other appropriate structure. It consists of two modules, the Data Control Unit (DCU) and the Remote Control/Display Unit (RCDU). Its purpose is to collect and distribute data from physiological experiments in the Spacelab and in the Orbiter. Author

HUMAN FACTORS ACTIVITIES IN TELEOPERATOR DEVELOPMENT AT THE OAK RIDGE NATIONAL LABORATORY
J. V. Draper and J. N. Herndon 1986 15 p Presented at the International Topical Meeting on Advances in Human Factors in Nuclear Power Systems, Knoxville, Tenn., 21 Apr. 1986 Prepared in cooperation with ORNL, Tenn.
(Contract DE-AC05-84OR-21400)
(DE86-005160; CONF-860415-2) Avail: NTIS HC A02/MF A01

The Consolidated Fuel Reprocessing Program (CFRP) at the Oak Ridge National Laboratory is developing advanced teleoperator systems for maintenance of future nuclear reprocessing facilities. Remote maintenance systems developed by the CFRP emphasize man-in-the-loop teleoperation. Consequently, human factors issues which affect teleoperator performance must be addressed. This paper surveys research and development activities carried out by the human factors group within the Remote Control Engineering Task of the CFRP. DOE

ASSISTED POSITIVE PRESSURE BREATHING AND MODIFIED ANTI-ACCELERATION SUIT FILLING TESTED UP TO 9 G IN A HUMAN CENTRIFUGE, KAROLINSKA INSTITUTE
Ulf I. Balldin Feb. 1986 14 p In SWEDISH; ENGLISH summary Sponsored by Swedish Material Administration of Armed Forces Air Material Department
(FOA-C-50038-H1; ISSN-0347-7665; ESA-86-97242) Avail: NTIS HC A02/MF A01

A modified anti-acceleration suit with ready pressure, faster filling, and higher end-pressure combined with normal breathing, and assisted and unassisted positive pressure breathing, was tested. Two acceleration-induced losses of consciousness occur at 8 to 9 G with normal breathing, but not with positive pressure breathing. Further negative physiological reactions are not recorded. Assisted positive pressure breathing is usually rated as best. Additional physical inconvenience occurs as a consequence of the high acceleration stresses, irrespective of equipment. ESA

EFFECTS OF SIMULATED WEIGHTLESSNESS ON MEIOSIS, FERTILIZATION, AND EARLY DEVELOPMENT IN MICE Final Report, 1 Jul. 1982 - 30 Apr. 1986
Debra J. Wolgemuth 1986 18 p
(Grant NAG2-324)
(NASA-CR-177106; NAS 1.26:177106) Avail: NTIS HC A02/MF A01 CSCL 06C

The initial goal was to construct a clinostat which could support mammalian cell culture. The clinostat was selected as a means by which to simulate microgravity conditions within the laboratory, by constant re-orientation of cells with respect to the gravity vector. The effects of this simulated microgravity on in-vitro meiotic maturation of oocytes, using mouse as the model system, was investigated. The effects of clinostat rotation on fertilization in-vitro was then examined. Specific endpoints included examining the timely appearance of male and female pronuclei (indicating fertilization) and the efficiency of extrusion of the second polar body. Particular attention was paid to detecting anomalies of fertilization, including parthenogenetic activation and multiple pronuclei. Finally, for the preliminary studies on mouse embryogenesis, a key feature of the clinostat was modified, that of the position of the cells during rotation. A means was found to immobilize the cells during the clinostat reotation, permitting the cells to remain at the axis of rotation yet not interfering with cellular development. B.G.

A POSSIBLE ROLE FOR ENDOGENOUS GLUCOCORTICOIDS IN ORCHIECTOMY-INDUCED ATROPHY OF THE RAT LEVATOR ANI MUSCLE: STUDIES WITH RU38486, A POTENT AND SELECTIVE ANTIGLUCOCORTICOID
Masaaki Konagaya (Nara Medical Coll., Japan) and Stephen R. Max Nov. 1985 17 p Submitted for publication
(Grant NAG2-100)
(NASA-CR-177029; NAS 1.26:177029) Avail: NTIS HC A02/MF A01 CSCL 06C

RU38486, a potent and selective antiglucocorticoid, was employed to study a possible role for endogenous glucocorticoids in atrophy of the levator ani muscle secondary to castration of male rats. RU38486 was shown to block (3H) triamcinolone acetonide binding to cytosol from levator ani muscle. Daily oral administration of RU38486 to castrated rats partially prevented

atrophy of the levator ani muscle, as well as a decrease in RNA concentration. In a control group receiving RU38486 alone, the levator ani underwent significant (20%) hypertrophy. Administration of exogenous dexamethasone also caused pronounced atrophy of the levator ani muscle. This atrophy was prevented, to a significant degree, by simultaneous oral administration of RU38486. It is concluded that endogenous glucocorticoids, the actions of which are blocked by RU38486, may be involved in regulation of the mass of the levator ani muscle in intact rats. M.G.

BIOLOGICAL STUDIES OF SWINE EXPOSED TO 60-Hz ELECTRIC FIELDS. VOLUME 5: HEMATOLOGY AND SERUM CHEMISTRY Final Report
Dec. 1985 127 p
(Contract DE-AC06-76RL-01830)
(DE86-005362; EPRI-EA-4318-Vol-5) Avail: NTIS
HC A07/MF A01

The hematologic and serum chemistry responses in three generations of miniature swine chronically exposed to a 30-kV/m, 60-Hz electric field have been assessed in a series of screening experiments. Based on comprehensive analyses and sequential statistical evaluation of the data, there are no significant differences in any hematologic parameters in either the F sub 0 or F sub 1 generations when the exposed and sham exposed groups are compared. In F sub 2 swine, at 42 days of age reticulocyte values were significantly higher in both sexes exposed to the electric field than in the control group. In addition, the exposed males at 42 days had significantly lower values for erythrocytes, hemoglobin and volume of packed red cells than the control males. Other values were comparable between exposed and control groups. Serum chemistry evaluations between exposed and control groups also showed no consistent statistical differences. A few parameters did show occasional differences between groups in the F sub 1 and F sub 2 generations, including: higher levels of urea nitrogen, triglyceride and alkaline phosphatase in exposed F sub 1 piglets; significantly lower serum protein levels in exposed F sub 2 males; and fewer serum globulins in both sexes of the F sub 2 generation. In summary, when hematologic and serum chemistry parameters were compared in exposed and sham-exposed groups of swine, some sporadic effects were evident. These effects, however, failed to replicate consistently at subsequent sampling periods or across generations and were not present as statistical trends when appropriate multivariate analyses were performed. DOE

BIOLOGICAL STUDIES OF SWINE EXPOSED TO 60-Hz ELECTRIC FIELDS. VOLUME 6: IMMUNOLOGY Final Report
Dec. 1985 61 p
(Contract DE-AC06-76RL-01830)
(DE86-005363; EPRI-EA-4318-Vol-6) Avail: NTIS
HC A04/MF A01

Immunological response in three generations of miniature swine chronically exposed to a 30-kV/m, 60-Hz electric field have been assessed in a series of screening experiments. The study was designed to investigate functional aspects of the humoral and cellular components of the mammalian immune system. Circulating levels of immunoglobulins were measured in parental-generation (F sub 0) sows (0 to 22 months of exposure), first-generation fetuses (F sub 1) at 100 days of gestation, F sub 1 females (0 to 32 months of exposure) and second-generation (F sub 2) weanlings at 1.5 and 6 months of age. No consistent, statistically significant changes in the levels of serum immunoglobins were observed when exposed groups were compared with sham-exposed controls, either within or across generations. An examination of cellular immunity included measurements of the mitogen response of peripheral-blood lymphocytes (PBL), spleen cells and lymph-node cells of F sub 0 sows sacrificed after 100 days of pregnancy, and PBL, spleen cells and thymocytes of F sub 1 fetuses at 100 days of gestation. Mitogen response studies of PBL, spleen cells, thymocytes and lymph-node cells of 42-day-old F sub 1 male weanlings and F sub 2 male and female swine were also conducted. In the statistical comparisons of mitogen-response data obtained for F sub 0 , F sub 1 , and F sub 2 swine, no consistent differences were observed between exposed and matched sham-exposed control groups. These observations indicate that the distribution of cells in the various tissues studied and the responses observed were not altered as a result of exposure to the fields. DOE

HC A02/MF A01

Progress made at calibrating the electric field distribution within and around cages used for behavorial testing of baboons is described. It is concluded that all of the parts of the system are rather constant in their readings. The only component which seems to show appreciable variability is the 4 cm probe. Although the optically coupled 4 cm spherical dipole probe usually performs well, it is becoming apparent that sometimes it can produce misleading results. Although we do not yet understand the situation completely, it appears as though there are at least two variables affecting the probe, battery voltage and humidity. DOE

HC A02/MF A01

The objective was to investigate, using baboons (superspecies Papio cynocephalus) as surrogates, possible behavioral effects associated with exposure to high intensity 60 Hz electric fields. This program consists of four major projects. The first will evaluate the potential aversive character of exposure to 60 Hz electric fields by determining the threshold intensity which produces avoidance or escape responses. The second project will estimate the threshold intensity for detection of 60 Hz electric fields. The third will assess effects of chronic exposure to 60 Hz electric fields on the performance of two operant conditioning tasks, fixed ratio (FR) and differential reinforcement of low rate responding (DRL). The fourth will investigate the possible stress-inducing effects of chronic exposure to 60 Hz electric fields on the behavior of baboons living in small social groups. DOE

DEVELOPMENT OF AN ALGORITHM TO MODEL AN AIRCRAFT EQUIPPED WITH A GENERIC CDTI DISPLAY
Wade C. Driscoll (Youngstown State Univ., Ohio.) and Jacob A. Houck Jul. 1986 58 p
(NASA-TM-87732; NAS 1.15:87732) Avail: NTIS HC A04/MF A01 CSCL 12A

A model of human pilot performance of a tracking task using a generic Cockpit Display of Traffic Information (CDTI) display is developed from experimental data. The tracking task is to use CDTI in tracking a leading aircraft at a nominal separation of three nautical miles over a prescribed trajectory in space. The analysis of the data resulting from a factorial design of experiments reveals that the tracking task performance depends on the pilot and his experience at performing the task. Performance was not strongly affected by the type of control system used (velocity vector control wheel steering versus 3D automatic flight path guidance and control). The model that is developed and verified results in state trajectories whose difference from the experimental state trajectories is small compared to the variation due to the pilot and experience factors. The purpose of this Validation Summary Report is to present the results and conclusions of performing standardized tests on the SofTech-AdaVAX compiler, Version 2.47. On-site testing was performed by the Federal Software Management Support Center (FSMSC)--an Ada Validation Facility--in accordance with current Ada Validation Office policies and procedures. Testing was done on the VAX-11/780, the VAX-11/785, and the VAX 8600. The suite of test known as the Ada Compiler Validation Capability (ACVC), Version 1.6, was used. The ACVC suite of tests is used to validate conformance of the compiler to ANSI/MIL-STD-1815A (Ada). The SofTech Compiler AdaVAX, Version 2.47, using VAX/VMS 4.1 and MicroVMS 4.1M, were tested with version 1.6 of the ACVC validation tests. The SofTech AdaVAX Ada Compiler was also tested. GRA

(AD-A166354) Avail: NTIS HC A03/MF A01 CSCL 09/2

The purpose of this Validation Summary Report is to present the results and conclusions of performing standardized tests on the Digital Equipment Corporation VAX Ada Compiler. On-site testing was performed during 12-16 August 1985 at Digital Equipment Corporation, Nashua, New Hampshire, by an Ada Validation Facility, the Federal Software Management Support Center, according to current Ada Validation Office (AVO) policies and procedures. The DEC VAX Ada Compiler is hosted on those systems listed in the table below. The hosts, as well as selected VAX/VMS and VAXELN based systems served as the target systems. The suite of tests known as the Ada Compiler Validation Capability (ACVC), Version 1.6, was used. The ACVC is used to validate conformance of the compiler to ANSI/MIL-STD-1815A. This standard is described in the ANSI Ada Reference Manual, February 17, 1983. Not all tests in the ACVC test suite are applicable to this specific implementation. Also, known test errors in Version 1.6 are present in some tests; these tests were withdrawn. The purpose of the testing is to ensure that the compiler properly implements legal language constructs and that it identifies, rejects from processing, and labels illegal constructs. GRA

TOFACS (TECHNICAL OFFICE AUTOMATION AND COMMUNICATION SYSTEM) SOFTWARE DEVELOPMENT AND ENHANCEMENTS FOR FISCAL YEAR 1983 - FISCAL YEAR 1985 Final Report, Oct. 1982 - Oct. 1985
Bob Wybraniec Feb. 1986 63 p
(AD-A166563; DTNSRDC/CMLD-86/06) Avail: NTIS HC A04/MF A01 CSCL 09/2

The Technical Office Automation and Communication System (TOFACS) is a pilot system that has been in operation for approximately five years. TOFACS provides users with workstations (terminal, modem and printer) and gives each user access to a comprehensive set of office automation capabilities such as electronic mail, document processing, calendar management, ticklers, and phone message management. Enhancements and development of new capabilities has improved the system and increased its overall functionality. This report chronicles the software enhancements and development made to TOFACS during fiscal years 1983 through 1985. GRA

ADA (TRADE NAME) COMPILER VALIDATION SUMMARY REPORT: INTERMETRICS, INC. I2ADA COMPILER, VERSION 17.08 FOR THE IBM 370 ARCHITECTURE UNDER UTS 2.3 Report, 10 Dec. 1985 - 10 Dec. 1986
10 Dec. 1985 68 p
(AD-A166818; AVF-VSR-22.0286) Avail: NTIS HC A04/MF A01 CSCL 09/2

This Validation Summary Report presents the results and conclusions of testing performed on the Intermetrics, Inc. I2Ada Compiler, Version 17.08. Standardized tests serve as input to an Ada complier, producing results which are evaluated by the validation team. This summary briefly states the highlights of the Intermetrics, Inc. I2Ada Complier, Version 17.08 validation. On-site testing was performed 6 Dec. 1985 through 10 Dec 1985 at Intermetrics, Inc. in Cambridge MA under the auspices of the Ada Validation Facility (AVF), according to Ada (C.R.) Validation Office (AVO) policies and procedures. The Intermetrics, Inc. I2Ada Compiler, Version 17.08 is hosted on the IBM 370 architecture operating under UTS 2.3. The suite of tests known as the Ada Compiler Validation Capability (ACVC), Version 1.6, was used. The ACVC is used to validate conformance of a compiler to ANSI/MIL-STD-1815A Ada. The purpose of testing is to ensure that a compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation dependent but permitted by the Ada Standard. Six classes of tests are used. These tests are designed to perform checks at compile time, at link time, or during execution. Author (GRA)

MULTIPROCESSOR MODEL WITH DISTRIBUTED TASK CREATION
J. E. Wirsching Jun. 1985 47 p
(Contract W-7405-eng-48)
(DE86-005302; UCRL-53648) Avail: NTIS HC A03/MF A01

A model has been constructed that simulates the operation of

a multiprocessor by means of a computer program, MULTIMOD, which simulates the execution of a FORTRAN program. During the execution of MULTIMOD, all application program operands are moved from memory locations through connection networks and ancillary registers and queues to their destinations. (The model simulates hardware, including processors, memory modules, connection networks, and connective registers and queues.) The arithmetic of the application and all indexing are performed, and all loop operations are carried out. MULTIMOD times all work done, and mutual interference of all elements is accounted for. The present model requires the FORTRAN source program to be augmented, and the augmented FORTRAN program supports a completely decentralized task-creation method. The hardware modeled uses fully implemented Banyan networks or full crossbars for data and synchronization and a ring network for task handling. Two kinds of sentinels are used in handling operands: one kind is used to control data requests, and the second is used to describe the data state. In addition, MULTIMOD implements such concepts as OUT-OF-BOUNDS, READ-ONLY, LOCK, EMPTY/FULL, and TAG-MATCH. Whenever possible, the model uses data-flow-methods. DOE

Jon D. Valett and Andrew Raskin *In its* Proceedings of Tenth Annual Software Engineering Workshop Dec. 1985 21 p (For primary document see N86-30357 21-61)
Avail: NTIS HC A16/MF A01 CSCL 09B

For the past ten year, the Software Engineering Laboratory (SEL) has been collecting data on software projects carried out in the Systems Development Branch of the Flight Dynamics Division at NASA's Goddard Space Flight Center. Through a series of studies using this data, much knowledge has been gained on how software is developed within this environment. Two years ago work began on a software tool which would make this knowledge readily available to software managers. Ideally, the Dynamic Management Information Tool (DynaMITe) will aid managers in comparison across projects, prediction of a project's future, and assessment of a project's current state. This paper describes an effort to create the assessment portion of DynaMITe, called the DynaMITe Expert Advisor for the SEL (DEASEL).Author

AN EXPERIMENTAL EVALUATION OF ERROR SEEDING AS A PROGRAM VALIDATION TECHNIQUE
John C. Knight and Paul E. Ammann *In* NASA. Goddard Space Flight Center Proceedings of Tenth Annual Software Engineering Workshop Dec. 1985 4 p (For primary document see N86-30357 21-61)
Avail: NTIS HC A16/MF A01 CSCL 09B

A previously reported experiment in error seeding as a program validation technique is summarized. The experiment was designed to test the validity of three assumptions on which the alleged effectiveness of error seeding is based. Errors were seeded into 17 functionally identical but independently programmed Pascal programs in such a way as to produce 408 programs, each with one seeded error. Using mean time to failure as a metric, results indicated that it is possible to generate seeded errors that are arbitrarily but not equally difficult to locate. Examination of indigenous errors demonstrated that these are also arbitrarily difficult to locate. These two results support the assumption that seeded and indigenous errors are approximately equally difficult to locate. However, the assumption that, for each type of error, all errors are equally difficult to locate was not borne out. Finally, since a seeded error occasionally corrected an indigenous error, the assumption that errors do not interfere with each other was proven wrong. Error seeding can be made useful by taking these results into account in modifying the underlying model. J.P.B.

A KNOWLEDGE BASED SOFTWARE ENGINEERING ENVIRONMENT TESTBED
Chris Gill, A. Reedy (Planning Research Corp., Washington, D. C.), and L. Baker (TRW Defense Systems Group, Cleveland, Ohio) *In* NASA. Goddard Space Flight Center Proceedings of Tenth Annual Software Engineering Workshop Dec. 1985 11 p (For primary document see N86-30357 21-61)
Avail: NTIS HC A16/MF A01 CSCL 09B

The Carnegie Group Incorporated and Boeing Computer Services Company are developing a testbed which will provide a framework for integrating conventional software engineering tools with Artificial Intelligence (AI) tools to promote automation and productivity. The emphasis is on the transfer of AI technology to the software development process. Experiments relate to AI issues such as scaling up, inference, and knowledge representation. In its first year, the project has created a model of software development by representing software activities; developed a module representation formalism to specify the behavior and structure of software objects; integrated the model with the formalism to identify shared representation and inheritance mechanisms; demonstrated object programming by writing procedures and applying them to software objects; used data-directed and goal-directed reasoning to, respectively, infer the cause of bugs and evaluate the appropriateness of a configuration; and demonstrated knowledge-based graphics. Future plans include introduction of knowledge-based systems for rapid prototyping or rescheduling; natural language interfaces; blackboard architecture; and distributed processing J.P.B.

EXPERIENCE WITH A SOFTWARE ENGINEERING ENVIRONMENT FRAMEWORK
R. Blumberg, A. Reedy, and E. Yodis *In* NASA. Goddard Space Flight Center Proceedings of Tenth Annual Software Engineering Workshop Dec. 1985 25 p (For primary document see N86-30357 21-61)
Avail: NTIS HC A16/MF A01 CSCL 09B

Experience with a software engineering environment framework tool called the Automated Product Control Environment (APCE) is described. The goals of the framework design, an overview of the major functions and features of the framework, and implementation and use of the framework are presented. Aspects of the framework discussed include automation and control; portability, distributability, and interoperability; cost/benefit analysis; and productivity. Results of using the framework are discussed and the framework approach is briefly compared to other software development environment approaches. J.P.B.

ONE APPROACH FOR EVALUATING THE DISTRIBUTED COMPUTING DESIGN SYSTEM (DCDS)
John T. Ellis *In* NASA. Goddard Space Flight Center Proceedings of Tenth Annual Software Engineering Workshop Dec. 1985 24 p (For primary document see N86-30357 21-61)
Avail: NTIS HC A16/MF A01 CSCL 09B

The Distributed Computer Design System (DCDS) provides an integrated environment to support the life cycle of developing real-time distributed computing systems. The primary focus of DCDS is to significantly increase system reliability and software development productivity, and to minimize schedule and cost risk. DCDS consists of integrated methodologies, languages, and tools to support the life cycle of developing distributed software and systems. Smooth and well-defined transistions from phase to phase, language to language, and tool to tool provide a unique and unified environment. An approach to evaluating DCDS highlights its benefits. A 1200-line Ada source code project simulating the most basic functions of an operations control center was developed. We selected George Cherry's Process Abstraction Methodology for

Embedded Large Applications (PAMELA) and DEC's Ada Compilation System (ACS) under VAX/VMS to build the software from requirements to acceptance test. The system runs faster than its FORTRAN implementation and was produced on schedule and under budget with an overall productivity in excess of 30 lines of Ada source code per day. Author

OBSERVATIONS FROM A PROTOTYPE IMPLEMENTATION OF THE COMMON APSE INTERFACE SET (CAIS)
Mike McClimens, Rebecca Bowerman, Chuck Howell, Helen Gill, and Robbie Hutchison *In* NASA. Goddard Space Flight Center Proceedings of Tenth Annual Software Engineering Workshop Dec. 1985 29 p (For primary document see N86-30357 21-61)
Avail: NTIS HC A16/MF A01 CSCL 09B

This paper presents an overview of the Common Ada Programming Support Environment (APSE) Interface Set (CAIS), its purpose, and its history. The paper describes an internal research and development effort at the Mitre Corporation to implement a prototype version of the current CAIS specification and to rehost existing Ada software development tools onto the CAIS prototype. Based on this effort, observations are made on the maturity and functionality of the CAIS. These observations support the government's current policy of publicizing the CAIS specification as a baseline for public review in support of its evolution into a standard which can be mandated for use as Ada is today. A CANONICAL FORM FOR NONLINEAR SYSTEMS
Renjeng Su and L. R. Hunt (Texas Univ., Dallas.) 1986 21 p
(Grants NAG2-203; NAG2-189; Contracts N0014-76-C-1136; N00014-84-C-0104)
(NASA-CR-176974; NAS 1.26:176974) Avail: NTIS HC A02/MF A01 CSCL 09B

The concepts of transformation and canonical form have been used in analyzing linear systems. These ideas are extended to nonlinear systems. A coordinate system and a corresponding canonical form are developed for general nonlinear control systems. Their usefulness is demonstrated by showing that every feedback linearizable system becomes a system with only feedback paths in the canonical form. For control design involving a nonlinear system, one approach is to put the system in its canonical form and approximate by that part having only feedback paths. Author

THEORETICAL RESEARCH PROGRAM TO STUDY CHEMICAL REACTIONS IN AOTV BOW SHOCK TUBES Technical Progress Report, 1 Nov. 1985 - 30 Jun. 1986
Peter Taylor 30 Jun. 1986 69 p
(Contract NCC2-371)
(NASA-CR-176992; NAS 1.26:176992) Avail: NTIS HC A04/MF A01 CSCL 09B

Progress in the development of computational methods for the characterization of chemical reactions in aerobraking orbit transfer vehicle (AOTV) propulsive flows is reported. Two main areas of code development were undertaken: (1) the implementation of CASSCF (complete active space self-consistent field) and SCF (self-consistent field) analytical first derivatives on the CRAY X-MP; and (2) the installation of the complete set of electronic structure codes on the CRAY 2. In the area of application calculations the main effort was devoted to performing full configuration-interaction calculations and using these results to benchmark other methods. Preprints describing some of the systems studied are included. For individual titles, see N86-30374 through N86-30377.

INTEGRAL PROCESSING IN BEYOND-HARTREE-FOCK CALCULATIONS
Peter R. Taylor *In its* Theoretical Research Program to Study Chemical Reactions in AOTV Bow Shock Tubes 30 Jun. 1986 21 p (For primary document see N86-30373 21-61)
Avail: NTIS HC A04/MF A01 CSCL 09B

The increasing rate at which improvements in processing capacity outstrip improvements in input/output performance of large computers has led to recent attempts to bypass generation of a disk-based integral file. The direct self-consistent field (SCF) method of Almlof and co-workers represents a very successful implementation of this approach. This paper is concerned with the extension of this general approach to configuration interaction (CI) and multiconfiguration-self-consistent field (MCSCF) calculations. After a discussion of the particular types of molecular orbital (MO) integrals for which -- at least for most current generation machines -- disk-based storage seems unavoidable, it is shown how all the necessary integrals can be obtained as matrix elements of Coulomb and exchange operators that can be calculated using a direct approach. Computational implementations of such a scheme are discussed. M.G.

BENCHMARK FULL CONFIGURATION-INTERACTION CALCULATIONS ON H2O, F- AND F
Charles W. Bauschlicher, Jr. and Peter R. Taylor (Eloret Corp., Sunnyvale, Calif.) *In* Eloret Corp. Theoretical Research Program to Study Chemical Reactions in AOTV Bow Shock Tubes 30 Jun. 1986 15 p (For primary document see N86-30373 21-61)
Avail: NTIS HC A04/MF A01 CSCL 09B

Full configuration-interaction calculations are reported, and compared to other methods, for H2O at its equilibrium geometry and at two geometries with the H-O bonds stretched. Since the percentage of the self-consistent field (SCF) reference in the full configuration-interaction (FCI) wave function decreases greatly with the bond elongation, the accuracy of techniques based on a single reference do not compare well with the FCI results. However, the results from a complete active space SCF/multireference configuration-interaction (CASSCF/MRCI) treatment are in good agreement with the FCI. Correlation effects in F compared to Ne are far more similar than for F- compared to Ne, despite F- and Ne being isoelectronic. Since the importance of higher than double excitations is more important for F- than F, a very high percentage of the correlation must be obtained to accurately compute the electron affinity. In a CASSCF/MRCI treatment the higher than quadruple excitations contribute 0.02 eV to the electron affinity (EA), even for modest basis sets. M.G.

BENCHMARK FULL CONFIGURATION-INTERACTION CALCULATIONS ON HF AND NH2
Charles W. Bauschlicher, Jr., Stephen R. Langhoff, Peter R. Taylor (Eloret Corp., Sunnyvale, Calif.), Nicholas C. Handy (Cambridge Univ. (England).), and Peter J. Knowles (University of Western Ontario, London.) *In* Eloret Corp. Theoretical Research Program to Study Chemical Reactions in AOTV Bow Shock Tubes 30 Jun. 1986 16 p (For primary document see N86-30373 21-61)
Avail: NTIS HC A04/MF A01 CSCL 09B

Full configuration-interaction (FCI) calculations are performed at selected geometries for the 1-sigma(+) state of HF and the 2-B(1) and 2-A(1) states of NH2 using both DZ and DZP gaussian basis sets. Higher excitations become more important when the bonds are stretched and the self-consistent field (SCF) reference becomes a poorer zeroth-order description of the wave function. The complete active space SCF - multireference configuration-interaction (CASSCF-MRCI) procedure gives excellent agreement with the FCI potentials, especially when corrected with a multi-reference analog of the Davidson correction. M.G.

ON THE ELECTRON AFFINITY OF THE OXYGEN ATOM
Charles W. Bauschlicher, Jr., Stephen R. Langhoff, Harry Partridge, and Peter R. Taylor (Eloret Corp., Sunnyvale, Calif.) *In* Eloret Corp. Theoretical Research Program to Study Chemical Reactions in AOTV Bow Shock Tubes 30 Jun. 1986 14 p (For primary document see N86-30373 21-61)
Avail: NTIS HC A04/MF A01 CSCL 09B

The electron affinity (EA) of oxygen is computed to be 1.287 eV, using 2p electron full configuration-interaction (CI) wave functions expanded in a 6s5p3d2f Slater-type orbital basis. The best complete active space self-consistent field - multireference CI (CASSCF-MRCI) result including only 2p correlation is 1.263 eV. However, inclusion of 2s intrashell and 2s2p intershell correlation increases the computed EA to 1.290 at the CASSCF-MRCI level. At the full CI basis set limit, the 2s contribution to the electron affinity is estimated to be as large as 0.1 eV. This study clearly establishes the synergistic effect between the higher excitations and basis set completeness on the electron affinity when the 2s electrons are correlated. M.G.

SEARCH AND RETRIEVAL OF OFFICE FILES USING dBASE 3
William L. Breazeale and Charlotte R. Talley Aug. 1986 85 p
(NASA-TM-86550; NAS 1.15:86550) Avail: NTIS HC A05/MF A01 CSCL 09B

Described is a method of automating the office files retrieval process using a commercially available software package (dBASE III). The resulting product is a menu-driven computer program which requires no computer skills to operate. One part of the document is written for the potential user who has minimal computer experience and uses sample menu screens to explain the program; while a second part is oriented towards the computer literate individual and includes rather detailed descriptions of the methodology and search routines. Although much of the programming techniques are explained, this document is not intended to be a tutorial on dBASE III. It is hoped that the document will serve as a stimulus for other applications of dBASE III. Author

DYNAMIC REMAPPING OF PARALLEL COMPUTATIONS WITH VARYING RESOURCE DEMANDS Final Report
David M. Nicol and Joel H. Saltz Jul. 1986 56 p Submitted for publication
(Contracts NAS1-17070; NAS1-18107)
(NASA-CR-178150; ICASE-86-45; NAS 1.26:178150) Avail: NTIS HC A04/MF A01 CSCL 09B

A large class of computational problems is characterized by frequent synchronization, and computational requirements which change as a function of time. When such a problem must be solved on a message passing multiprocessor machine, the combination of these characteristics lead to system performance which decreases in time. Performance can be improved with periodic redistribution of computational load; however, redistribution can exact a sometimes large delay cost. We study the issue of deciding when to invoke a global load remapping mechanism. Such a decision policy must effectively weigh the costs of remapping against the performance benefits. We treat this problem by constructing two analytic models which exhibit stochastically decreasing performance. One model is quite tractable; we are able to describe the optimal remapping algorithm, and the optimal decision policy governing when to invoke that algorithm. However, computational complexity prohibits the use of the optimal remapping decision policy. We then study the performance of a general remapping policy on both analytic models. This policy attempts to minimize a statistic W(n) which measures the system degradation (including the cost of remapping) per computation step over a period of n steps. We show that as a function of time, the expected value of W(n) has at most one minimum, and that when this minimum exists it defines the optimal fixed-interval remapping policy. Our decision policy appeals to this result by remapping when it estimates that W(n) is minimized. Our performance data suggests that this policy effectively finds the natural frequency of remapping. We also use the analytic models to express the relationship between performance and remapping cost, number of processors, and the computation's stochastic activity. Author

THE FORCE ON THE FLEX: GLOBAL PARALLELISM AND PORTABILITY Final Report
Harry F. Jordan (Colorado Univ., Boulder.) Aug. 1986 22 p
(Contract NAS1-17070; Grant AF-AFOSR-0189-85)
(NASA-CR-178161; ICASE-86-54; NAS 1.26:178161) Avail: NTIS HC A02/MF A01 CSCL 09B

A parallel programming methodology, called the force, supports the construction of programs to be executed in parallel by an unspecified, but potentially large, number of processes. The methodology was originally developed on a pipelined, shared memory multiprocessor, the Denelcor HEP, and embodies the primitive operations of the force in a set of macros which expand into multiprocessor Fortran code. A small set of primitives is sufficient to write large parallel programs, and the system has been used to produce 10,000 line programs in computational fluid dynamics. The level of complexity of the force primitives is

intermediate. It is high enough to mask detailed architectural differences between multiprocessors but low enough to give the user control over performance. The system is being ported to a medium scale multiprocessor, the Flex/32, which is a 20 processor system with a mixture of shared and local memory. Memory organization and the type of processor synchronization supported by the hardware on the two machines lead to some differences in efficient implementations of the force primitives, but the user interface remains the same. An initial implementation was done by retargeting the macros to Flexible Computer Corporation's ConCurrent C language. Subsequently, the macros were caused to directly produce the system calls which form the basis for ConCurrent C. The implementation of the Fortran based system is in step with Flexible Computer Corporations's implementation of a Fortran system in the parallel environment. Author

THE COMPUTER-AIDED ANALYTIC PROCESS MODEL. OPERATIONS HANDBOOK FOR THE ANALYTIC PROCESS MODEL DEMONSTRATION PACKAGE Research Note, May 1980 - Feb. 1983
Ronald G. Shapiro, Richard F. Bloom, and John F. Oates, Jr. Jan. 1986 65 p
(Contracts MDA903-80-C-0345; DA Proj. 2Q2-63743-A-794)
(AD-A166180; ARI-RN-86-06) Avail: NTIS HC A04/MF A01 CSCL 09/2

The objective of the computer-aided APM is to provide a routinized, thorough, adaptive and efficient procedure to help testers, analysts and researchers develop design specifications and evaluation measures for any planned or existing human-machine system, and especially for any training system. The demonstration version of the computer-aided model performs a sample of the routines expected in any ultimate version that may be developed in the future. Specifically, the demonstration model helps one to derive evaluation measures, but not design specifications. In addition, it contains data bases for training systems, but not for any other human-machine system. Finally, it contains data bases for only half of the six training subsystems (for design, enabling and delivery, but not for command, logistics or emplacement). For demonstration purposes, this development represents an appropriate and sufficient allocation of project resources, since the more significant effort was needed to develop the underlying concepts for both a feasible manual model and the computer-aided model. ALGORITHM FOR SEGMENTATION OF MULTICHANNEL IMAGES M.S. Thesis
James F. Janecek Dec. 1985 44 p
(AD-A166215) Avail: NTIS HC A03/MF A01 CSCL 09/2

Segmentation is an important step in the computer based analysis of images. This thesis addresses the segmentation of images of multiple channels of data. Such images are referred to as multichannel images. Examples of these are color images, where the channels represent color components, and remote sensing data, where the channels may represent signals from various visible and infrared frequency bands. This thesis describes and demonstrates how segmentation of multichannel images into homogeneous regions can be accomplished using linear predictive filtering. Results are given for some synthetically generated color images of two textures. GRA

(Contracts N00039-82-C-0235; ARPA Order 4031)
(AD-A166622) Avail: NTIS HC A04/MF A01 CSCL 09/2

The availability of low-cost workstations with a bit-mapped display and mouse has made possible widespread use of graphics software. User interfaces can display data through a convenient graphics interface rather than the textual presentations necessitated by older technology. One of the most applicable structures of computer science is a graph (i.e., a graph with vertices and edges as opposed to a drawing). If the graph drawing problems could be overcome, a tool could be written to browse through graphs using the natural graphical display. Such a tool, or graph browser, would display graphs in a reasonable format and allow users to query or edit the data represented by the graphs. This report describes the design of a general graph browser based on our experiences with an earlier prototype. Chapter 2 discusses the prototype and the limitations encountered with it. Chapter 3 describes the design of a general graph browser, called GRAB, and the user interface it provides. Chapter 4 describes an implementation design of GRAB, including the database design and the heuristics used to draw reasonable-looking graphs. Chapter 5 concludes with a summary and a discussion of future extensions to GRAB. GRA

A DIGITAL FILTER FOR REMOVING KNOWN COMPONENTS FROM SPECTROSCOPIC DATA M.S. Thesis
Carey G. Mumford, III Aug. 1985 68 p
(AD-A166680; AFIT/CI/NR-86-36T) Avail: NTIS HC A04/MF A01 CSCL 07/4

This document presents a computational system designed to remove known components from spectroscopic data. The system realization is a FORTRAN-77 program; a listing of the program's source code is included in the Appendix. The program first performs a nine-point quadratic least-squares smoothing function. It then removes the known component with a non-recursive filter based on a least-squares prediction of the observed spectrum and a least-squares prediction of a computer generated synthetic spectrum of the known component. The program was tested using an artificial spectrum created for the sole purpose of testing the program's function. The program's function was verified with three segments of the 12 micron band of ethane taken from data recorded on the Fourier transform spectrometer at the McMath solar telescope at the Kitt Peak National Observatory. The segments are located near 804.0, 815.0, and 819.5/cm. Plots of the spectral data and of the resultant data are included. GRA

COMPOSITING DISSPLA OUTPUT WITH SYNTHETIC IMAGES ISSCO WEEK 86
J. Mareda 1986 8 p Presented at the ISSCO Week, New Orleans, La., 10 Mar. 1986
(Contract DE-AC04-76DP-00789)
(DE86-004555; SAND-85-2054C; CONF-860363-1) Avail: NTIS HC A02/MF A01

A number of graphics packages exist at Sandia to provide scientists and engineers a means of efficiently representing their data. These packages include DISSPLA, TELL-A-GRAF, Mapper, Movie BYU, Weasel, and some state of the art scene software currently under development. Some very enhanced graphics can be obtained by combining the output of some of these graphics packages. This presentation will discuss a method that was developed which allows incorporating the output of DISSPLA, the most widely used graphics package at Sandia for representing scientific data, with the scene software. The result of this combination is a high quality very informative graph. The procedures that are used to perform this combination will be discussed and many examples of the resulting output will be presented. The technique can be used for simply adding annotation to an image generated using the scene software or to add an attractive background from the scene software to a text slide made using DISSPLA. This technique can also be used to merge a ray-traced 3-D surface with a corresponding 3-D DISSPLA vector plot. This is how the two graphs from Sandia on the 1985 ISSCO poster for the Battle of the Artists were made. DOE

ROBOTIC SIMULATION
B. L. Peck Feb. 1986 9 p
(Contract DE-AC04-76DP-00613)
(DE86-006517; BDX-613-3410) Avail: NTIS HC A02/MF A01

Simulation software offers great potential for cost savings and added assurance of maximum efficiency in manufacturing operations. It is estimated that 60 to 80% of a total robotic work cell implementation effort is involved in layout, equipment design, robot selection, and hardware mock up of the cell. The remainder of the effort is taken up with programming and final refinements made on the shop floor. Simulation techniques are also contributing significantly to development of offline programming. Simulation programs can offer a major cost savings. DOE

REFERENCE GUIDE FOR USING IGVIEW, AN IGES COMPATIBLE GEOMETRY DISPLAY, EDITING, AND ANALYSIS SYSTEM
R. M. Dolin and D. L. Jaeger Dec. 1985 46 p
(Contract W-7405-eng-36)
(DE86-007190; LA-10565-M) Avail: NTIS HC A03/MF A01

This report provides an introduction to the Initial Graphics Exchange Specification (IGES) compatible code called IGVIEW. This software can be used to display, edit, and analyze two-dimensional IGES formatted geometry. IGVIEW was written to comply with IGES version 2.0, which is the current national geometry standard. This report is intended only to serve as a reference manual for IGVIEW users. It contains a description of all the possible commands that can be used, and how to execute them. It details how to execute the code, read in a geometry file, and write a geometry file. There is also a discussion about what types of computer systems and terminals the current version of IGVIEW will support. The procedures for developing a material library are shown, and a short example library is provided. DOE

SHARED MEMORY, CACHE, AND FRONTWIDTH CONSIDERATIONS IN MULTIFRONTAL ALGORITHM DEVELOPMENT
R. E. Benner 23 Jan. 1986 24 p
(Contract DE-AC04-76DP-00789)
(DE86-007245; SAND-85-2752) Avail: NTIS HC A02/MF A01

A concurrent, multifrontal algorithm (Benner and Weigand 1986) for solution of finite element equations was modified to better use the cache and shared memories on the ELXSI 6400, and to achieve better load balancing between child processes via frontwidth reduction. The changes were also tailored to use distributed memory machines efficiently by making most data local to individual processors. The test code initially used 8 Mbytes of incached shared memory and 155 cp (concurrent processor) sec (a speedup of 1.4) when run on 4 processors. The changes left only 50 Kbytes of uncached, and 470 Kbytes of cached, shared memory, plus 530 Kbytes of data local to each child process. Total cp time was reduced to 57 sec and speedup increased to 2.8 on 4 processors. Based on those results an addition to the ELXSI multitasking software, asynchronous I/O between processes, is proposed that would further decrease the shared memory requirements of the algorithm and make the ELXSI look like a distributed memory machine as far as algorithm development is concerned. This would make the ELXSI an extremely useful tool for further development of special-purpose, finite element computations. DOE

THE STEINER TREE PROBLEM. LINEAR PROGRAMMING MODEL AND DECOMPOSITION TECHNIQUE RESOLUTION Ph.D. Thesis [LE PROBLEME DE L'ARBRE DE STEINER. MODELISATION PAR PROGRAMMATION LINEAIRE ET RESOLUTION PAR DES TECHNIQUES DE DECOMPOSITION]
Lucile Guyard-Daher Oct. 1985 250 p In FRENCH
(ENST-85E010; ISSN-0751-1353; ESA-86-97214) Avail: NTIS HC A11/MF A01

A combinatorial optimization analysis is presented. A general linear programming analytical approach is detailed. A second heuristic approach allows the treatment of graphs with 200 peaks and 1500 arcs, with an error < 10%. The resolution of Steiner problems is discussed. The iteration complexity and the computer memory used by the methods discussed are compared, showing that the choice of algorithm may affect the cost factors by an order of magnitude. ESA

WEIGHTED DECODING OF BLOCK LINEAR CODES Ph.D. Thesis [DECODAGE PONDERE DES CODES LINEAIRES EN BLOCS]
Juing Fang Jan. 1986 202 p In FRENCH
(ENST-86E001; ISSN-0751-1353; ESA-86-97216) Avail: NTIS HC A10/MF A01

A decoding algorithm was studied to determine its average complexity and its asymptotic behavior. Computerized simulations confirm the positive evaluation. Suboptimal Battail algorithm variants are examined and their simulation shows acceptable efficiency. The analysis and simulation shows that the channel nonuniform quantifying does not significantly improve the gain. Complexity theory is used to demonstrate that efficient probabilistic algorithms or polynomial time suboptimal algorithms are reasonable solutions. The modulations using a large number of states are also studied, concluding the error correcting codes may be useful for that case also. ESA

AN IMPROVED TEST FOR THE EQUALITY OF COEFFICIENTS OF VARIATION
R. Doornbos, J. Dijkstra, and J. B. Dijkstra Apr. 1984 9 p
(THE-RC-54335B; ESA-86-97307) Avail: NTIS HC A02/MF A01

The D-test for the quality of coefficients of variation in normal populations proposed by Doornbos and Dijkstra (1983) was modified. The modification yields a simpler algorithm; better control over the chosen size of the test; and a considerable improvement of the power. The last two remarks are especially true for small samples. A RELATIONAL DATABASE ENVIRONMENT FOR SOFTWARE DEVELOPMENT
Anthony I. Wasserman and Martin L. Kersten May 1984 20 p Sponsored by Netherlands Organization for the Advancement of Pure Research
(IR-86; ESA-86-97322) Avail: NTIS HC A02/MF A01

The software tool environment for the User Software Engineering (USE) methodology is built around a compact relational database management system (Troll/USE). Within this environment, called the Unified Support Environment, tools communicate with Troll/USE through message passing. Tools include a database browser and editor, a rapid prototyping system, and interactive database design aid, a data dictionary system, a programming language, and a version control/configuration management system. The way in which these tools support the USE methodology is described. The resulting environment is highly flexible and well suited for development of software systems and additional tools. ESA

AN ALGORITHM TO FIND MINIMAL SEQUENCES OF PASS DIRECTIONS FOR ATTRIBUTE GRAMMARS
Henk Alblas 1983 47 p
(INF-83-6; ESA-86-97371) Avail: NTIS HC A03/MF A01

A polynomial time algorithm that delivers a shortest sequence of pass directions for several simple multipass grammars is discussed. It starts from a given sequence of pass directions and tries to find a shorter one by considering possible distributions of the attributes over the passes and crossing out empty passes. An extension of the algorithm also reconsiders and possibly changes directions in order to find passes that become empty. The resulting sequences of pass directions are minimal with respect to the subsequence ordering, i.e., no subsequence exists for which an associated distribution of the attributes over the passes meets the simple multipass requirements. ESA

EXCEPTION HANDLING CONSTRUCTS CONSIDERED UNNECESSARY
Maarten M. Fokkinga Apr. 1984 13 p
(INF-84-8; ESA-86-97373) Avail: NTIS HC A02/MF A01

It is shown that, as Black (1982) argues, normal control structures, together with the data type discriminated union, suffice to replace exception handling facilities in a satisfactory way. Even with the discriminated union approach, incremental program construction is still possible. Programs using discriminated unions resemble the programs using exception handling facilities more than Black suggests. ESA

INPUT SIGNAL DESIGN FOR SYSTEM IDENTIFICATION; A COMPARATIVE ANALYSIS
A. Krolikowski and P. Eykhoff Oct. 1984 25 p
(ER-84/06; ESA-86-97526) Avail: NTIS HC A02/MF A01

Input signal design for system identification when the input signal is amplitude constrained and the input sequence is of finite-length is investigated. Optimality criteria used to derive the optimal identifying input sequence include Rissanen's Minimum Description Length criterion; the determinant of the information matrix; the information matrix determinant ratio; and the trace of the parameter error covariance matrix. These input design criteria can also be used in structure selection (multivariate systems) or in model order (univariate systems) estimation procedures. Autoregressive models are empasized, and the input signal sequences are derived using a dynamic programming approach. Analytical results and simulations are presented. ESA

N86-30403# Technische Hogeschool, Eindhoven (Netherlands).
ON-LINE DESIGN RULE CHECKER
L. Orbons 10 Jul. 1984 64 p
(ESA-86-97529) Avail: NTIS HC A04/MF A01

An on-line design rule checker for the interactive layout editors ISLE and CM was developed. It can check a layout consisting of paraxial rectangles for width and spacing violations. Error messages are immediatly reported to the designer, detected errors are also stored in error lists. The checker can also be used off-line. ESA

A COLLECTION OF AREA OF INTEREST (AOI) ALGORITHMS Final Report
Ann Griesel, James Gillis, E. Drell, R. J. Gardner, and F. Lesh Jul. 1985 105 p
(Contract NAS7-918)
(NASA-CR-176984; JPL-D-171; NAS 1.26:176984; AD-A166509) Avail: NTIS HC A06/MF A01 CSCL 09/2

This report presents several independently developed and tested algorithms implemented in Pascal and FORTRAN 77 for determining if a point falls within a specified quadrilateral Area of Interest (AOI). These algorithms represent several ways of mathematically solving the AOI point inclusion problem, and provide a set of unclassified benchmarks against which existing system algorithms can be evaluated. Each of the other reports, listed in Appendix A, analyzes algorithms from several existing Intelligence and Electronic Warfare I/EW systems that perform a single function and examine their underlying mathematics. The main functional areas studied have been correlation, geographic transformations, and direction finding and location (fix) estimation. In this introductory section, the basic mathematical and geometric considerations on which the AOI algorithms presented later are based will be introduced, and the potential order dependence inherent in defining a polygon by the location of its vertices discussed. The second section presents the algorithms, and the third third section, an overview of testing results and algorithm evaluations. GRA

DATAFLOW ARCHITECTURES Interim Report
David E. Culler 12 Feb. 1986 35 p
(Contract N00014-83-K-0125)
(AD-A166235; MIT/LCS/TM-294) Avail: NTIS HC A03/MF A01 CSCL 09/2

Dataflow graphs are described as a machine language for parallel machines. Static and dynamic dataflow architectures are presented as two implementations of the abstract dataflow model. Static dataflow allows at most one token per arc in dataflow graphs and thus only approximates the abstract model where unbounded token storage per arch is assumed. Dynamic architectures tag each token and keep them in a common pool of storage, thus permitting a better approximation of the abstract model. The relative merits of the two approaches are discussed. Functional data structures and I-structures are presented as two views of data structures which are both compatible with the dataflow model. These views are contrasted and compared in regard to efficiency and exploitation of potential parallelism in programs. A discussion of major dataflow projects and a prognosis for data flow architectures are also presented. Author (GRA)

PROTECTION AND RESOURCE CONTROL IN DISTRIBUTED OPERATING SYSTEMS
Sape J. Mullender and Andrew S. Tanebaum 15 Mar. 1984 31 p Revised
(IR-79; ESA-86-97319) Avail: NTIS HC A03/MF A01

A method to protect local networks against malicious users without placing any restrictions on the kinds of operating systems that can be constructed is discussed. Depending on the hardware, one-way functions or public key cryptography forms the basis for the protection. It is shown how a traditional object-oriented capability system can be implemented on top of the basic protection mechanism, and how a service for accounting and resource control can be constructed. ESA

FUNCTIONS WITHIN THE DATA COMMUNICATION LAYERS OF THE ISO OPEN SYSTEMS INTERCONNECTION (OSI) MODEL Ph.D. Thesis
A. Pras Mar. 1984 76 p
(INF83/IPS/042; ESA-86-97368) Avail: NTIS HC A05/MF A01

Two service types for the data-communication layers of the ISO-OSI model: the connectionless and the connection-oriented service, are discussed. The main difference between these service types is that the latter incorporates a three party negotiation phase. Although connection-orientation is one of the basic ideas behind the reference model for open system interconnection, the connection approach may not be the best for all data-communication layers. Many functions within these layers can also be performed with a connectionless service type. It is argued that it is possible with a connectionless network service to avoid congestion. ESA

A FORMAL DESCRIPTION TECHNIQUE AND THE ISO TRANSPORT LAYER Ph.D. Thesis
J. W. C. Trouwee Mar. 1984 102 p
(INF83/IPS/007; ESA-86-97369) Avail: NTIS HC A06/MF A01

A formal specification language for protocol systems, based on the temporal ordering of interaction primitives, was studied to

aid standardizing the ISO Reference Model for Open System Interconnection (OSI). The specification of these standards has to be done unambiguously in a formal language. The way the language can be used to specify the OSI standards was assessed by describing formally the Transport Service-standard and Transport Protocol-standard from the ISO Reference Model. From the standards, a functional substructure was constructed. ESA

OVERVIEW OF ROME: A REASON-ORIENTED MODELING ENVIRONMENT Interim Report
Donald W. Kosy and Ben P. Wise Dec. 1985 19 p
(AD-A166259; CMU-RI-TR-85-21) Avail: NTIS HC A02/MF A01 CSCL 09/2

The ROME system is an experimental decision support system (DSS) generator that incorporates facilities originally developed for expert artificial intelligence systems. Like other DSS generators, it provides a set of tools for building, running, and documenting mathematical models of business activities. Beyond that, however, the system includes explicit differentiation between hard facts and softer information such as assumptions and expectations, a set of procedures for evaluating and explaining results, and a natural language user interface. In this paper, we discuss the representation of knowledge in ROME and show how it is used to answer questions, explain trends, detect anomalous values, and assess the credibility of model assumptions. SENSOR DRIVEN ROBOT SYSTEMS TESTBED
R. W. Harrigan 1986 18 p Presented at the SPIE Technical Symposium on Applications of Artificial Intelligence, Orlando, Fla., 31 Mar. 1986
(Contract DE-AC04-76DP-00789)
(DE86-005892; SAND-85-2032C; CONF-860366-1) Avail: NTIS HC A02/MF A01

Intelligent robot systems which operate in a semiautonomous fashion (i.e., the operator serves only as a high level supervisor) require the integration of sensors and mechanisms coupled by intelligent software. Since robot systems operate in the real world with imperfect knowledge of that world, error recovery is an important aspect of any control strategy. Configured with a 6 degree-of-freedom robot manipulator, two dimensional vision and force sensing, the Sensor Driven Robot Systems Testbed offers an environment for the development of control concepts for intelligent machine systems. The Sensor Driven Robot Systems Testbed has led to the development of active sensing concepts using complementary sensors and a highly modular control software concept. Both concepts are currently being implemented within the testbed environment. DOE

APPLICATION OF ARTIFICIAL INTELLIGENCE TECHNIQUES TO FAULT DIAGNOSIS FOR PRINTED CIRCUITS Ph.D. Thesis [APPLICATION DES TECHNIQUES DE L'INTELLIGENCE ARTIFICIELLE AU DIAGNOSTIC DE DEFAUTS DES CIRCUITS IMPRIMES]
Eric Barrielle Dec. 1985 131 p Partly in FRENCH and ENGLISH
(ENST-85E011; ISSN-0751-1353; ESA-86-97215) Avail: NTIS HC A07/MF A01

A fault diagnosis system based on a Prolog language is described. Artificial intelligence languages are discussed in order to justify the choice. The system is composed of five experts dealing with successive tasks: a manager task, a how to look at the problem task, a measurement choice task, a measurement and fault location task, and a last task to verify the diagnosis. A logics printed circuit can be seen as an oriented graph whose components are strongly connected. A program development subsystem is used to interpret the rules and to verify the interface between the manager and the expert. The advantages derived from the use of Prolog are emphasized. Simplicity and efficiency are claimed. ESA

N86-30414# Technische Hogeschool, Eindhoven (Netherlands). Dept. of Electrical Engineering.
APPLICATION OF INPUT SIGNAL DESIGN IN SYSTEM IDENTIFICATION FOR ADAPTIVE CONTROL
A. Krolikowski Sep. 1984 32 p
(ER-84/04; ESA-86-97524) Avail: NTIS HC A03/MF A01

An approach to the dual control problem, based on the heuristic combination of the input signal design (probing action) with the suboptimal adaptive control algorithm (control action) is proposed. The computation of the probing inputs requires no additional effort so the overall algorithm is easy to implement, and consistent computationally. The algorithm seems to be especially appealing in the case of a short control horizon, high noise level, and for a large uncertainty associated with the unknown system parameters. The crucial problem remains how to choose the probing action length, the amplitude constraint, and the learning parameter in the case of the active adaptive control algorithm. ESA

N86-30415# Technische Hogeschool, Eindhoven (Netherlands). Dept. of Electrical Engineering.
ADAPTIVE CONTROL OF FIRST-ORDER SYSTEMS WITH TIME-DELAY
A. Krolikowski Oct. 1984 11 p
(ER-84/05; ESA-86-97525) Avail: NTIS HC A02/MF A01

An infinite horizon control problem of a linear discrete-time, first-order system with time delay is considered. The performance of the control strategy is evaluated by the multistep quadratic loss function. In the case of known system parameters, the optimal input is shown to be a simple saturation of the minimum variance control input. In the case of unknown system parameters, an adaptive control algorithm based on the recursive maximum likelihood estimation procedure is presented. Simulation results for various magnitudes of the amplitude constraint are given. ESA

APPROXIMATIONS OF NONLINEAR SYSTEMS HAVING OUTPUTS

L. R. Hunt and Renjeng Su 1985 24 p
(Grants NAG2-189; NAG2-203; Contract N000014-76-C-1136)
(NASA-CR-176946; NAS 1.26:176946) Avail: NTIS HC A02/MF A01 CSCL 12A

For a nonlinear system with output derivative x = f(x) and y = h(x), two types of linearizations about a point x(0) in state space are considered. One is the usual Taylor series approximation, and the other is defined by linearizing the appropriate Lie derivatives of the output with respect to f about x(0). The latter is called the obvservation model and appears to be quite natural for observation. It is noted that there is a coordinate system in which these two kinds of linearizations agree. In this coordinate system, a technique to construct an observer is introduced. M.G.

GENERATING IDEALS IN POLYNOMIAL RINGS
S. Mandal and A. Roy 1986 11 p
Avail: NTIS HC A02/MF A01

Boratynski proved that if I is an ideal in a polynomial ring k[X sub 1,...,X sub n] over a field k, then I is set-theoretically generated by mu(I/I squared) elements (mu denotes the minimal number of generators). A theorem is presented which extends Boratynski's result in the following way: suppose R = A[X] is a polynomial ring over a noetherian commutative ring A and I is an ideal in R that contains a monic polynomial; then I is set-theoretically generated by mu(I/I squared) elements. It also follows from this that if R = A[X sub 1,...,X sub n,Y sub 1(sup + or - 1),...,Y sub r(sup + or - 1)] and I is an ideal in R such that ht I > or = dim A + 1, then I is set-theoretically generated by mu(I/I squared) elements. In addition, some partial results concerning the question of whether mu(I) = mu(I/I squared) are proved. M.G.

A MINIMUM ENTROPY PRINCIPLE IN THE GAS DYNAMICS EQUATIONS Final Report
Eitan Tadmor May 1986 21 p Submitted for publication
(Contracts NAS1-17070; NAS1-18107; DAAG29-85-K-0190; Grant NSF DMS-85-03294)
(NASA-CR-178123; NAS 1.26:178123; ICASE-86-33) Avail: NTIS HC A02/MF A01 CSCL 12A

Let u(x bar,t) be a weak solution of the Euler equations, governing the inviscid polytropic gas dynamics; in addition, u(x bar, t) is assumed to respect the usual entropy conditions connected with the conservative Euler equations. We show that such entropy solutions of the gas dynamics equations satisfy a minimum entropy principle, namely, that the spatial minimum of their specific entropy, (Ess inf s(u(x,t)))/x, is an increasing function of time. This principle equally applies to discrete approximations of the Euler equations such as the Godunov-type and Lax-Friedrichs schemes. Our derivation of this minimum principle makes use of the fact that there is a family of generalized entrophy functions connected with the conservative Euler equations. Author

(Contracts NAS1-17070; NAS1-18107; Grants NSF DMS-82-00883; NSF DMS-82-05355; NSF DMS-85-04316; AF-AFOSR-0398-84)
(NASA-CR-178133; NAS 1.26:178133; ICASE-86-43) Avail: NTIS HC A03/MF A01 CSCL 12A

The problem of estimating discontinuous coefficients, including locations of discontinuities, that occur in second order hyperbolic systems typical of those arising in I-D surface seismic problems is discussed. In addition, the problem of identifying unknown parameters that appear in boundary conditions for the system is treated. A spline-based approximation theory is presented, together with related convergence findings and representative numerical examples. Author

ON SUBSTRUCTURING ALGORITHMS AND SOLUTION TECHNIQUES FOR THE NUMERICAL APPROXIMATION OF PARTIAL DIFFERENTIAL EQUATIONS
M. D. Gunzburger (Carnegie-Mellon Univ., Pittsburgh, Pa.) and R. A. Nicolaides May 1986 32 p
(Contracts NAS1-18107; CDAAG-29-83-4-0084; Grants AF-AFOSR-0101-83; AF-AFOSR-0231-83)
(NASA-CR-178122; ICASE-86-30; NAS 1.26:178122) Avail: NTIS HC A03/MF A01 CSCL 12A

Substructuring methods are in common use in mechanics problems where typically the associated linear systems of algebraic equations are positive definite. Here these methods are extended to problems which lead to nonpositive definite, nonsymmetric matrices. The extension is based on an algorithm which carries out the block Gauss elimination procedure without the need for interchanges even when a pivot matrix is singular. Examples are provided wherein the method is used in connection with finite element solutions of the stationary Stokes equations and the Helmholtz equation, and dual methods for second-order elliptic equations. THE EXPANDED LAGRANGIAN SYSTEM FOR CONSTRAINED OPTIMIZATION PROBLEMS
Aubrey B. Poore (Colorado State Univ., Fort Collins.) Jul. 1986 30 p
(Contract NAS1-18107; Grants NSF DMS-85-10201; AFOSR-ISSA-85-00079)
(NASA-CR-178142; ICASE-86-47; NAS 1.26:178142) Avail: NTIS HC A03/MF A01 CSCL 12A

Smooth penalty functions can be combined with numerical continuation/bifurcation techniques to produce a class of robust and fast algorithms for constrainted optimization problems. The key to the development of these algorithms is the Expanded Lagrangian System which is derived and analyzed in this work. This parameterized system of nonlinear equations contains the penalty path as a solution, provides a smooth homotopy into the first-order necessary conditions, and yields a global optimization technique. Furthermore, the inevitable ill-conditioning present in a sequential optimization algorithm is removed for three penalty methods: the quadratic penalty function for equality constraints, and the logarithmic barrier function (an interior method) and the quadratic loss function (an interior method) for inequality constraints. Although these techniques apply to optimization in general and to linear and nonlinear programming, calculus of variations, optimal control and parameter identification in particular, the development is primarily within the context of nonlinear programming. PRECONDITIONING FOR FIRST-ORDER SPECTRAL DISCRETIZATION
Craig L. Streett and Michele G. Macaraeg Aug. 1986 25 p
(NASA-TM-87619; NAS 1.15:87619) Avail: NTIS HC A02/MF A01 CSCL 12A

Efficient solution of the equations from spectral discretizations is essential if the high-order accuracy of these methods is to be realized. Direct solution of these equations is rarely feasible, thus iterative techniques are required. A preconditioning scheme for first-order Chebyshev collocation operators is proposed herein, in which the central finite difference mesh is finer than the collocation mesh. Details of the proper techniques for transferring information between the meshes are given here, and the scheme is analyzed by examination of the eigenvalue spectra of the preconditioned operators. The effect of artificial viscosity required in the inversion of the finite difference operator is examined. A second preconditioning scheme, involving a high-order upwind finite difference operator of the van Leer type is also analyzed to provide a comparison with the present scheme. Finally, the performance of the present scheme is verified by application to several test problems. Author

CONFIDENCE REGIONS FOR VARIANCE COMPONENTS IN UNBALANCED MIXED LINEAR MODELS
Alan P. Fenech and David A. Harville Jan. 1986 30 p
(Contract N00014-85-K-0418)
(AD-A165841; PREPRINT-SER-86-12) Avail: NTIS HC A03/MF A01 CSCL 12/1

A general procedure for obtaining exact confidence regions for the variance components in unbalanced mixed linear models is presented. The procedure utilizes, as pivotal quantities, quadratic forms that may depend on the variance components in a complicated way and that are distributed independently as chi-square variates. In the special case of balanced classificatory models, the pivotal quantities simplify to scalar multiples of sums of squares from the usual analysis of variance. The procedure can be easily modified so as to obtain an exact confidence region for ratios of variance components and can be regarded as a generalization of Wald's procedure for obtaining a confidence interval for a single variance ratio. PRELIMINARY INVESTIGATION OF A CALCULUS OF FUNCTIONAL DIFFERENCES: FIXED DIFFERENCES
Bruce J. MacLennan Feb. 1986 28 p
(AD-A165879; NPS52-86-010) Avail: NTIS HC A03/MF A01 CSCL 12/1

This document introduces a notion of functional differences in which the difference of a function f with respect to a function h is that function g that describes how the value of f changes when its argument is altered by h: f(h x) = g(f x). It also introduce the inverse operation of functional integration and derive useful properties of both operations. The result is a calculus that facilitates derivation and reasoning about recursive programs. This is illustrated in a number of simple examples. The author presents preliminary results pertaining to fixed differences, that is, functional differences that do not depend on the value of the argument x. Author (GRA)

WALSH-FOURIER ANALYSIS OF DISCRETE-VALUED TIME SERIES
David S. Stoffer Nov. 1985 45 p
(Contract F49620-85-C-0008)
(AD-A166139; TR-85-46; AFOSR-86-0064TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

An approach to the analyses of discrete-valued time series is discussed. The analyses are accomplished in the spectral domain using the Walsh-Fourier transform which is based on Walsh functions. This approach will enable an investigator of discrete systems to analyze the data in terms of square-waveforms and sequency rather than sine-waves and frequency. This document develops a general signal-plus-noise type model for discrete-valued time series in which Walsh-Fourier spectral analysis is of interest. The author considers the problems of detecting whether or not a common signal exists in repeated measures on discrete-valued time series and in discrete-valued processes collected in an experimental design. It is shown that these models may depend on unknown regression parameters and consistent estimates of these parameters based on the finite Walsh-Fourier transform are developed. Applications to certain Markov models are given, however, the methods presented also apply to non-Markov cases. Author (GRA)

INVESTIGATIONS ON IMPROVED ITERATIVE METHODS FOR SOLVING SPARSE SYSTEMS OF LINEAR EQUATIONS Final Report, 1 Jul. 1981 - 30 Jun. 1984
Richard S. Varga Nov. 1985 16 p
(Grant AF-AFOSR-0226-80)

(AD-A166170; AFOSR-86-0027TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

The research conducted under this effort was centered about general matrix methods and applications of matrix theory in solving large systems of linear equations. In particular, the classification of certain factorizations of M matrices was undertaken. An extension of the Stein-Rosenberg theorem comparing the spectral radii of matrices useful in constructing iterative solution techniques was obtained. The use of summability methods and approximated conformal mapping techniques in the study of iterative methods was pursued. Finally, a study of SOR and SSOR iterative methods was accomplished using the theory of H matrices. Eleven papers appeared in the referred literature during this effort. GRA

STATE ESTIMATION FOR COX PROCESSES WITH UNKNOWN LAW: PARAMETRIC MODELS

Alan F. Karr Nov. 1985 18 p

(AD-A166179; AFOSR-86-0020TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

Let (N sub i, M sub i) be i.i.d. copies of a Cox pair (N,M), with the Cox processes N sub i, but not the directing measures M Sub i, observable. Suppose that the probability law of (N,M) belongs to a finite-dimensional parametric family sub theta but is otherwise unknown. Approximations are derived for state estimators. Under standard smoothness and requlrarity assumptions n times the difference between the true and pseduo-state estimators converges in distribution to a Gaussian random measure, with respect to the variation norm topology. Computation of maximum likelihood estimators by the EM algorithm is discussed in general and for two specific examples. GRA

ASYMPTOTIC METHODS FOR THE ANALYSIS, ESTIMATION AND CONTROL OF STOCHASTIC DYNAMIC SYSTEMS Annual Report, 11 Nov. 1984 - 10 Nov. 1985

Alan S. Willsky and George C. Verghese 4 Dec. 1985 26 p

(Grant AF-AFOSR-0258-82)

(AD-A166234; LIDS-SR-1516; AFOSR-86-0026TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

The basic scope of this grant is to carry out fundamental research in the analysis, control, and estimation of complex systems, with particular emphasis on the use of methods of asymptotic analysis and multiple time scales to decompose complex problems into interconnections of simpler ones. During the time period covered by this report, significant progress had been made in several areas, leading to important results and to promising direction for further research. The Specific topics covered in this report are: 1) Analysis and Estimation for Finite-State and Hybrid Processes Possessing Time or Spatial Decompositions; 2) Analysis and control of Singularly Perturbed and Weakly Coupled Linear Systems; and 3) Analysis and Estimation for Singular Systems. ROBUST EMPIRICAL BAYES ANALYSES OF EVENT RATES

Donald P. Gaver and Iognaid G. OMuircheartaigh Mar. 1986 56 p

(AD-A166681; NPS55-86-007) Avail: NTIS HC A04/MF A01 CSCL 12/1

A number, I, of nominally similar items generate events (e.g., failures) at possibly different rates, or mean time intervals. This paper addresses the problem of appropriately pooling the data from the different sources. The approach is parametric empirical Bayes: true individual item rates are assumed to come from a fixed superpopulation. It is shown how parameters of a superpopulation model can be estimated from all of the data, and combined with individual unit history, can provide improved estimates of individual rates. The procedure can be robust: evidence that a particular rate is far off from the main body of rates permits that outlier to stand by itself, i.e., to resist pooling. Illustrative analyses of data are supplied. GRA

PIECEWISE ANALYTICAL PERTURBATION SERIES METHODS FOR SOLVING LINEAR ORDINARY DIFFERENTIAL EQUATIONS. PART 2: THE RADIAL SCHROEDINGER EQUATIONS

Gh. Adam Dec. 1984 44 p

(DE86-700606; IFIN-FT-257-1984-Pt-2) Avail: NTIS (US Sales Only) HC A03/MF A01

The general scheme established in the previous paper for the efficient use of piecewise analytical perturbation series (PAPS) methods to solve linear ordinary differential equations is applied to the radial Schroedinger equation. Starting with a step function approximation to the potential, four optimal PAPS algorithms are written down which show orders of accuracy equal respectively to two, four, six and eight. A comparison with previously published methods in this class illustrates the importance of the optimal choice of the various parameters which enter the PAPS algorithms (approximation of the potential, keeping into the algorithm relevant terms only, adequate difinition of the finite basis set of functions in terms of which the algorithm is expressed). A comparison with the Numerov method in its summed form (which is the most stable version with respect to round off) illustrates the significantly better performances of the optimal sixth order PAPS algorithns. A FAST, TREE-BASED ACCESS METHOD

Wiebren deJonge, Andrew S. Tanenbaum, and Reind P. vandRiet Mar. 1984 32 p

(Grant ZWO-62-139)

(IR-85; ESA-86-97321) Avail: NTIS HC A03/MF A01

A highly compact representation of binary trees is presented. It is shown how these compact binary trees can be used to represent separators efficiently. The fanout, and thus performance, of a B-tree can be improved by using the method within each index page for representing separators. An index organization, slightly different from a B-tree, that offers another improvement is outlined. The result is a fast, tree-based access method for dynamic files. The idea behind the compact binary trees can be employed for representing pictures and quadtrees compactly. ESA

DIMENSION OF BINARY CONVEX STRUCTURES
M. vandeVel Mar. 1984 40 p
(IR-226; ESA-86-97325) Avail: NTIS HC A03/MF A01

It is shown that for compact spaces with a normal binary convexity, the dimension functions dim, ind, Ind, and cohomological dimension are all equal. An n-dimensional compact space X with a normal binary convexity embeds in a product of an n-dimensional connected quotient of X with the space of X-components. Both results are obtained with an auxiliary theory of convex dimension. Applications to completely distributive lattices are given. ESA

N86-30441# Vrije Universiteit, Amsterdam (Netherlands). Dept. of Mathematics and Computer Science.
CONTINUITY OF CONVEXITY PRESERVING FUNCTIONS
M. vandeVel Mar. 1984 23 p
(IR-237; ESA-86-97328) Avail: NTIS HC A02/MF A01

A result of Shirley and Stralka (1971) on the continuity of surjective homomorphisms between finite dimensional lattices is extended to binary convex structures and convexity preserving surjections, and this extension also applies to trees. An additional condition for the finite dimensional case is presented. Similarities with vector spaces lead to the formulation of a general problem. ESA

N86-30442# Vrije Universiteit, Amsterdam (Netherlands). Dept. of Mathematics and Computer Science.
ON MODERATE AND LARGE DEVIATIONS IN MULTINOMIAL DISTRIBUTIONS
Wilbert C. M. Kallenburg May 1984 28 p
(IR-242; ESA-86-97332) Avail: NTIS HC A03/MF A01

Moderate and large deviation theorems for the likelihood ratio statistic and the chi-square statistic in multinomial distributions are presented. Let k be the number of parameters and n the number of observations. Moderate and large deviation theorems are available in literature only if k is kept fixed when n tends to infinity. Although attention is focussed on k = k (n) as n tends to infinity explicit inequalities are obtained for k and n fixed. These inequalities imply results for the whole scope of moderate and large deviations for fixed k and for k (n) tends to infinity as n tends to infinity. It turns out that the Chi-squared approximation continues to hold, even if k tends to infinity. Applications include the study of the influence of the choice of the number of classes on the power in goodness of fit tests. ESA

N86-30443# Vrije Universiteit, Amsterdam (Netherlands). Dept. of Mathematics and Computer Science.
A CODIMENSION TWO BIFURCATION WITH A THIRD ORDER PICARD-FUCHS EQUATION
R. Cushman and J. A. Sanders Mar. 1984 23 p
(IR-249; ESA-86-97338) Avail: NTIS HC A02/MF A01

Using a third order Picard-Fuchs equation, it is shown that a certain two parameter family of planar vector fields for parameter values in a certain cone has a unique limit cycle, which is born from a Hopf bifurcation and dies in a saddle connection. This removes a superfluous hypothesis in Theorem 3.2, Chapter 13 of Chow and Hale (1982). ESA

ONE-PARAMETER FAMILIES OF OPTIMIZATION PROBLEMS: EQUALITY CONSTRAINTS Thesis
H. Th. Jongen, P. Jonker, and F. Twilt 25 Feb. 1986 26 p
Submitted for publication
(ESA-86-97357) Avail: NTIS HC A03/MF A01

Generalized critical points are introduced and their relationship with other concepts of critical and stationary points is discussed. Under generic regularity conditions, the set of generalized critical points, in particular the change of the Morse index is studied. Problems with equality constraints only are considered. Extending the theory to problems with inequality constraints is indicated. ESA

N86-30445# Technische Hogeschool, Eindhoven (Netherlands). Dept. of Electrical Engineering.
THE ESTIMATION OF MINIMAL POLYNOMIAL COEFFICIENTS AND A START SEQUENCE OF MARKOV PARAMETERS M.S. Thesis
J. L. J. M. vanderWeijden Sep. 1984 101 p
(ESA-86-97519) Avail: NTIS HC A06/MF A01

Two least-squares methods for estimating the minimal polynomial coefficients and the start sequence of Markov parameters are presented. The first method tries to find the minimum of a quadratic loss function (being the squared distance of the estimated Markov parameters to the available noise corrupted set of parameters) by an iteration process. The second algorithm uses a hill climbing procedure to find the optimum of the error function (in this case the squares of the differences between the estimated output signals and the measured signals). Both procedures are compared with each other and with an explicit iterative algorithm that estimates truncated impulse responses. ESA

N86-30446# Technische Hogeschool, Eindhoven (Netherlands). Dept. of Electrical Engineering.
IDENTIFICATION OF MULTIVARIABLE SYSTEMS AND REPRESENTATION IN CANONICAL AND PSEUDO-CANONICAL FORM M.S. Thesis
P. M. Carriere Nov. 1984 130 p
(ESA-86-97520) Avail: NTIS HC A07/MF A01

The structural and parametric identification of stable, linear, time-invariant, time-discrete, and observable (or controllable) multivariable systems is treated. The structural identification is performed by methods using the determinants ratio and the singular value decomposition. The compensated least squares method, and the instrumental variable method are used to accomplish the parametric identification. The processes are identified in an Input/Output model and from there transformations to represent them in the canonical and pseudo-canonical form of the state space model are performed. ESA

65 STATISTICS AND PROBABILITY

ASSIST: USER'S MANUAL
Sally C. Johnson Aug. 1986 42 p
(NASA-TM-87735; NAS 1.15:87735) Avail: NTIS HC A03/MF A01 CSCL 12A

Semi-Markov models can be used to compute the reliability of virtually any fault-tolerant system. However, the process of delineating all of the states and transitions in a model of a complex system can be devastingly tedious and error-prone. The ASSIST program allows the user to describe the semi-Markov model in a high-level language. Instead of specifying the individual states of the model, the user specifies the rules governing the behavior of the system and these are used by ASSIST to automatically generate the model. The ASSIST program is described and illustrated by examples. Author

MATHEMATICAL AND STATISTICAL CHARACTERIZATIONS

OF GENERALIZED HYPEREXPONENTIAL DISTRIBUTION FUNCTIONS
Robert F. Botta, Carl M. Harris, and William G. Marchal Feb. 1986 46 p
(Contract N00014-86-K-0029)
(AD-A165892; GMU/49146/101) Avail: NTIS HC A03/MF A01 CSCL 12/1

This paper examines in detail the class of generalized hyperexponential (GH) probability distribution functions. The family is compared to and contrasted with similar popular classes of distributions used in stochastic modeling. Each of these families arises from a desire to preserve the computationally attractive feature of memorylessness possessed by the exponential probability distribution while extending the representations to a broader class in order to approximate an arbitrary probability distribution function. Thus, the simple structure and attractive properties of the GH probability distribution functions are presented with a view toward facilitating the mathematical operations which frequently occur in practice. SELECTING THE BEST POPULATION, A DECISION THEORETIC APPROACH: THE CASE OF PARETO DISTRIBUTION
N. Dailami (Sheffield Univ., England.), K. Subramanyam, and M. B. Rao Nov. 1985 36 p
(Contract F49620-85-C-0008)
(AD-A166152; TR-85-41; AFOSR-86-0061TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

The main ideas in selecting the best populations meeting some prescribed optimality criterion have been mooted originally by Bechchofer and Gupta and the subject has gone from strength to strength by several contributions by several statisticians over the last three decades. In this paper, the selection problem is tackled from a decision theoretic point of view. In selecting the best population, we take into account the cost of sampling and the penalties for taking a wrong decision. We are basically interested in selecting the best Pareto population following the lead given by Somerville and Ofosu. The Pareto proposed this model to study the distribution of incomes in various societies for comparison. In medical circles, this has been used as a model for the remission rate of discharged psychiatric patients as a survival model for cardiac patients waiting for a heart transplant operation. This paper considers four different types of penalty functions including the one considered by Ofosu. Under three of these penalty function we derive the minimax sample sizes. The maximum of the resultant loss function is explicitly derived overcoming the difficulty faced by Ofosu. GRA

THE NUMBER OF CLASSES IN CHI-SQUARE GOODNESS OF FIT TESTS
W. C. M. Kallenberg and J. Oosterhoff Mar. 1984 45 p
(IR-246; ESA-86-97336) Avail: NTIS HC A03/MF A01

The power of chi-square goodness of fit tests based on different partitions is studied by considering contamination and exponential families of densities between the null density and fixed alternative densities. For sample sizes n tends to infinity, local asymptotic theory with respect to the number of classes k is developed for such families. Simple sufficient and almost necessary conditions under which it is asymptotically optimal to let k tend to infinity with n are derived. A numerical study shows that the results of the asymptotic local theory for contamination families agree well with power performance of chi-square tests. For heavy-tailed alternatives these tests have the best power when k is relatively large. Unbalanced partitions with small classes in the tails perform surprisingly well, particularly when the alternatives have fairly heavy tails. ESA

N86-30452# Vrije Universiteit, Amsterdam (Netherlands). Dept. of Mathematics and Computer Science.
A SIMPLE EXAMPLE WHERE THE JACKNIFE FAILS
W. C. M. Kallenberg May 1984 11 p
(IR-256; ESA-86-97344) Avail: NTIS HC A02/MF A01

An example where the jacknife procedure fails in reducing the bias of the maximum likelihood estimator is presented. By considering an asymptotically equivalent, yet easier, estimating problem in terms of Bernoulli random variables it is shown why straightforward application of the jacknife procedure fails, and how bias reduction can be obtained by application of the jacknife procedure on the right statistic. ESA

USE OF A VIRTUAL CONTROL APPROACH IN STATE ESTIMATION
A. T. Fleury and A. Rios-Neto May 1986 21 p Proposed for presentation at the 10th World IFAC Congress, Munich, West Germany, 26-31 Jul. 1987
(INPE-3903-PRE/944) Avail: NTIS HC A02/MF A01

This work presents the development of a state estimator for dynamic systems and explores the dual function existing between state estimation and optimal control problems. An estimator algorithm similar to the Extended Kalman Filter can be used in real-time nonlinear systems which can be recursively approximated by linear systems. The original estimation problem is transformed into an equivalent one of virtual control. This control problem is then used to generate and adaptive, locally convergent algorithm where, instead of full state estimation, one has to estimate just a control vector with smaller dimension than the state vector. The control formulation also allows the development of convergence acceleration criteria. The algorithms are implemented in a digital computer to estimate the orbit of a low Earth orbit satellite under simulated conditions. Numerical results are presented for a test case considering critical initial values for the estimator and observations provided by three Earth stations. Author

STATE ESTIMATION AND PARAMETER IDENTIFICATION OF LINEAR AND SEMILINEAR DISTRIBUTED PARAMETER SYSTEMS
J. A. M. FelippeDeSouza and A. J. Pritchard May 1986 8 p Presented at the 2d conference on Telecommunication and Control, Rio de Janeiro, Brazil, 10-13 Dec. 1985
(INPE-3904-PRE/945) Avail: NTIS HC A02/MF A01

Some results are presented for the joint problem of state estimation and parameter identification of linear systems of the type: z = Az + A sub 1 alpha, z(0) = z sub zero, and semilinear systems of the type: z = Az + A sub 1 Alpha + N(z,a), z(0) = z sub zero, where A and A sub 1 are linear operators and N is nonlinear operator defined on an appropriate Banach space Z, the state space, and are dependent on the parameter alpha epsilon IR superscript p to be identified. The initial state z sub zero is unknown. The observation process is described by: y = Cz, where C is a linear operator from Z to Y (output space). It is assumed that the dynamics of the linear part can be described in terms of a strongly continuous semigroup on Z, so that this formulation includes distributed parameter systems and delay systems as well as lumped parameter system. STATE ESTIMATION AND PARAMETER IDENTIFICATION FOR SEMILINEAR DISTRIBUTED PARAMETER SYSTEMS
J. A. M. FelippeDeSouza Jun. 1986 8 p Presented at the 6th Conference on Automatic Control, Belo Horizonte, Brazil, 25-28 Nov. 1986
(INPE-3932-PRE/964) Avail: NTIS HC A02/MF A01

The problem is considered of state estimation and parameter identification of semilinear systems of the type derivitive z=Az+Nz (A=A(alpha) linear, N (alpha) nonlinear, alpha and R sup P being the p parameters to be identified) with an observation y = Cz (C linear). It is assumed that the dynamic of the linear part (i.e., derivitive z = Az) can be described in terms of a strongly continuous semigroup on an appropriate Banach space Z, so that this formulation includes distributed parameter systems and delay systems as well as lumped parameter systems. First of all we develop some theoretical results by using fixed point theorems with some mappings F:X yields X, where X is a space of functions from the interval (O,T) to Z (the possible trajectories of the system). However, these results are obtained by imposing some conditions on the space of output functions, which restrict the class of systems studied. Therefore we also consider an approach involving the pair (z sub 0,z(.)) consisting of the initial state and the trajectory in a space M which is the cross product Z x X between the state space Z and the space of trajectories X. We show that the solution of the problems of state estimation and parameter identification can be obtained via the fixed point of a variety of maps F:M yields M. Author

CONTROL OF NONLINEAR DISTRIBUTED PARAMETER SYSTEMS USING FIXED POINT TECHNIQUES
J. A. M. FelippedeSouza Jun. 1986 8 p Presented at the 9th Congresso Nacional de Matematica Aplicada e Computacional, Brasilia, Brazil, 25-29 Aug. 1986
(INPE-3922-PRE/956) Avail: NTIS HC A02/MF A01

Fixed point theorems have been an important tool used by mathematicians in the study of the existence of a solution to nonlinear differential equations, and nonlinear operator equations in general, since the beginning of the century. The present paper discuss the several fixed point techniques used in control of nonlinear systems in papers already published on this subject. The semigroup approach is used so that distributed parameter systems are considered. Author

ON INFERENCE AND TRANSIENT RESPONSE FOR M/G/1 MODELS
Donald P. Gaver and Patrica A. Jacobs Mar. 1986 19 p
(AD-A166578; NPS55-86-006) Avail: NTIS HC A02/MF A01 CSCL 12/1

This paper addresses two problems of interest in service system analysis: (a) that of making statistical, data-driven estimates of the long-run probability of a long delay, and (b) the assessment of rate of approach to a long-run system performance measure such as expected delay, the rate being characterized by a simple exponential, at least initially. Both are illustrated by reference to M/G/1 and related systems. Author (GRA)

VALID INEQUALITIES FOR MIXED 0-1 PROBLEMS M.S. Thesis
P. W. M. M. Hermans Sep. 1984 87 p
(ESA-86-97305) Avail: NTIS HC A05/MF A01

Mixed zero-one regions which are described by one single inequality, concerning both zero-one variables and continuous variables, and by bounding-restrictions in the continuous variables are considered. Classes of valid linear inequalities (or facets of the underlying polytope) are derived. Given a point that is no element of the underlying polytope, methods to detect such valid linear inequalities (or facets) which are also violated by this point are derived. The detected inequalities (or facets) can be used to strengthen the formulation of mixed zero-one problems, so that, e.g., a branch and bound method, applied to the strengthened formulation, might reach the optimal solution sooner than if the original formulation is used. Initially this document considers the standard isonormal linear process L on a Hilbert space H, and applying metric entropy methods obtains bounds for a certain probability. Under the assumption that the entropy function of C grows polynomially, we find bounds of the form where delta squared is the maximal variance of L. We use a notion of entropy finer than that usually employed, and specifically suited to the non-stationary situation. As a result we obtain, in the non-stationary setting, more precise bounds than any in the literature. We then treat a number of examples in which the power alpha is identified. These include the distribution of the maximum of certain locally stationary processes. GRA

COMPUTATIONAL EFFICIENCY STUDY OF A SEMI-ANALYTICAL TECHNIQUE FOR THE ANGULAR INTEGRAL ESTIMATION FOUND IN TRANSFER MATRIX GENERATION
R. D.M. Garcia 1984 10 p In PORTUGUESE
(DE86-700784; CTA-IEAV-NT-011/84) Avail: NTIS (US Sales Only) HC A02/MF A01

The computational efficiency of a semi-analytic technique recently proposed for the evaluation of certain angular integrals encountered in the generalization of the isotropic and linearly anisotropic components of elastic and discrete inelastic transfer matrices is studied. It is concluded from a comparison with results obtained with the use of numerical quadratures that the technique has certain computational advantages that recommend its implementation. DOE

CHEBYSHEV SETS AND CONTINUOUS POSITION
M. vandeVel Mar. 1984 11 p
(IR-245; ESA-86-97335) Avail: NTIS HC A02/MF A01

A subset of a vector space is in continuous position if it satisfies a certain relative closure condition for convex open sets. Every convex set is in continuous position. The converse statement (for closed sets only) leads to a problem which is similar to the Chebyshev set problem. It is shown that a combination of the two conditions leads to the convexity of the given set in a Hilbert space. Results concerning boundedly compact sets in a Banach space, and compact sets in an arbitrary locally convex space are derived. ESA

CRITICAL SETS IN PARAMETRIC OPTIMIZATION Thesis
H. Th. Jongen, P. Jonker, and F. Twilt Aug. 1985 36 p Revised Submitted for publication
(ESA-86-97358) Avail: NTIS HC A03/MF A01

The concept of a generalized critical point (gc point) is introduced. Every local minimum, Kuhn-Tucker point, and point of Fritz John type is a gc point. Under fairly weak (even generic) conditions the set consisting of all gc points is studied. Due to the parameter, the set is pieced together from one-dimensional manifolds. The points of the set can be divided into five (characteristic) types. The subset of nondegenerate critical points (first type) is open and dense (nondegenerate means strict complementarity nondegeneracy of the corresponding quadratic form, and linear independence of the gradients of binding constraints). A nondegenerate critical point is completely characterized by four indices. The change of these indices along the set is presented. The Kuhn-Tucker subset is studied in connection with the (failure of the) Mangasarian-Fromowitz constraint qualification. ESA

FUNDAMENTAL RELATIVISTIC SOLUTION FOR THE RAILGUN Interim Report, Aug. - Dec. 1985
Richard L. Liboff, Gregory K. Schenter, and G. L. Ferrentino (Army Armament Research and Development Command, Dover, N. J.) Apr. 1986 17 p Sponsored in part by Battelle Columbus Labs, Ohio
(Contract DAAG29-81-D-0100)
(AD-A166607; ARFSD-CR-86004) Avail: NTIS HC A02/MF A01 CSCL 20/3

A fully relativistic analysis is made of the dynamics of a railgun based on three assumptions: (1) Ohm's law is valid in the rest frame of the plasma, (2) total electron momentum is transferred to the projectile, and (3) motion of the projectile is constrained to one direction. With these assumptions, a relativistic equation for the velocity of the projectile is obtained whose solution monotonically increases to one of two values depending on field strengths. For B>E, the maximum velocity is cE/B whereas for E>B it is c where c is the speed of light, and E and B are applied electric and magnetic fields, respectively. GRA

INVESTIGATION OF THE AERODYNAMIC PERFORMANCE AND NOISE CHARACTERISTICS OF A 1/5TH SCALE MODEL OF THE DOWTY ROTOL R212 PROPELLER
W. J. G. Trebble 15 Nov. 1983 35 p
(RAE-TM-AERO-1983; BR90678; ESA-86-97104) Avail: NTIS HC A03/MF A01

The four-bladed Dowty Rotol R212 propeller (NACA 16 sections) was studied at 1/5th scale (0.7 m diameter) in 1.5 m acoustic tunnel. Propeller power absorption and thrust were measured over a range of rotational speeds up to 8000 rev/min at mainstream speeds from 15 to 60 m/sec for a range of blade settings. Slipstream wake surveys show outward movement of the position of the peak pressure as propeller loading is increased. Noise analysis demonstrates the predominance of multiple tones whose number and intensity increase with helical-tip Mach number. An empirical formula shows that the fundamental tone sound pressure level varies with tip speed and power loading in an identical manner to that observed on an ARA-D section propeller. ESA

NOISE PREDICTIONS OF A HIGH BYPASS TURBOFAN ENGINE USING THE LOCKHEED NEAR-FIELD NOISE PREDICTION PROGRAM
John W. Rawls, Jr. Jul. 1986 71 p
(Contract NAS1-18000)
(NASA-CR-178146; NAS 1.26:178146) Avail: NTIS HC A04/MF A01 CSCL 20A

The prediction of engine noise during cruise using the Near-Field Noise Prediction Program developed by Lockheed is examined. Test conditions were established which simulate the

operation of a high bypass turbofan engine under a wide range of operating conditions. These test conditions include variations in altitude, flight Mach number and thrust setting. Based on the results of noise prediction made using the Lockheed program, an evaluation of the impact of these test conditions on the overall sound pressure level(OASPL)and the one-third octave band spectra is made. An evaluation of the sensitivity of flight condition parameters is also made. The primary noise source from a high bypass turbofan was determined to be fan broadband shock noise. This noise source can be expected to be present during normal cruising conditions. When present, fan broadband shock noise usually dominates at all frequencies and all directivity angles. Other noise sources of importance are broadband shock noise from the primary jet, fan noise, fan mixing noise and turbine noise. Author

(NASA-TM-87745; NAS 1.15:87745) Avail: NTIS HC A02/MF A01 CSCL 20A

NASA Langley Research Center personnel have conducted an evaluation of the helicopter aural detection program I Can Hear It Now (ICHIN version-5). This was accomplished using flight noise data of five helicopters, obtained from a joint NASA and U.S. Army acoustics measurement program. The evaluation consisted of presenting the noise data to a jury of 20 subjects and to the ICHIN-5 program. A comparative study was then made of the detection distances determined by the jury and predicted by ICHIN-5. This report presents the changes made in the ICHIN-5 program as a result of this comparative study. The changes represent current psychoacoustics and propagation knowledge. Author

This report investigates the propagation of finite amplitude acoustic signals through an inhomogeneous ocean both analytically and numerically. In the numerical study the ocean is assumed to be stratified. The effects of inhomogeneity, ordinary attenuation and dispersion, and nonlinear geometrical acoustics are discussed. Two explosion waveforms are considered: a weak shock with an exponentially decaying tail and a more realistic waveform that includes the first bubble pulse. Numerical propagation of the simpler wave along a 58.1 km path starting at a depth of 300 m leads to the following conclusions: (1) The effect of inhomogeneity on nonlinear distortion is small. (2) Dispersion plays an important role in determining the arrival time of the pulse. (3) Neither nonlinearity nor ordinary attenuation (and dispersion) are paramount; both need to be included. For a more realistic wave, propagation is along a 23 km ray path starting from a depth of 4300 m. Two charge weights, 0.818 kg and 22.7 kg TNT, are assumed. In each case the energy spectrum of the signal obtained by considering finite amplitude effects for the entire 23 km path is compared with spectra obtained by neglecting finite amplitude effects entirely, after the first 150 m, and after the first 1100 m. Finite amplitude effects are of small consequence in the case of the 0.818 kg TNT explosion for frequencies below 6 kHz at distances beyond 1100 m. For the 22.7 kg explosion the corresponding quantities are 4 kHz and 1100 m. GRA

LORENTZ INVARIANCE AND THE ROTOR DOPPLER SHIFT EXPERIMENTS
W. A. RodriguesJunior (Universidade Estadual de Campinas (Brazil).) and J. Tiomno 1984 23 p Prepared in cooperation with Universidade Estadual de Campinas (Brazil). Inst. de Matematica.
(DE86-700614; CBPF-NF-017/84) Avail: NTIS (US Sales Only) HC A02/MF A01

It is shown that rotor doppler shift experiments provide a way to distinguish Einstein's Special Relativity (SR) from Lorentz's Aether Theory (LAT). Misconceptions in previous papers involving the Doppler shift experiments are examined. The theoretical and experimental data available on rotor Doppler shift experiments are analysed. Two models of SR violating theories are used to predict the output of a recently proposed experiment by Torr and Kolen. The first one corresponds to (strict) LAT and the other to an extended form of LAT Contrary to the first, the second theory leads to results in agreement with the preliminary experimental data of Torr et al indicating a breakdown both of SR and strict LAT. AUDITORY HELICOPTER DETECTION AND LOCALIZATION; A LITERATURE REVIEW FOCUSING ON SEARCH FOR HELICOPTERS
Clemens Weikert Jan. 1986 19 p In SWEDISH; ENGLISH summary
(FOA-C-50033-H2; ISSN-0347-7665; ESA-86-97241) Avail: NTIS HC A02/MF A01

About 300 references on auditory localization were reviewed. Detection of low frequency sound is discussed. Literature shows that man's ability to localize sounds by auditory detection is good. Vision may also assist the auditory localization. A helicopter approaching at a great height (1500 feet) is easier to localize than a low flying one (200 feet), and a helicopter heading into the wind is significantly more difficult to localize than one having the wind astern, even when the wind speed is low. When background conditions are quiet, one may expect to detect a noisy helicopter at a distance over 13 km. ESA

LASER STUDIES OF HALOGENS AND OXYGEN Final Report, 1 Nov. 1984 - 31 Oct. 1985
Paul L. Houston 1 Jan. 1986 6 p
(Contract F49620-83-K-0012)
(AD-A166257; AFOSR-86-0105TR) Avail: NTIS HC A02/MF A01 CSCL 20/5

Interconversions of energy between the metastable species of halogens, interhalogens, and oxygen are important to the determination of the mechanisms for the chemical oxygen/iodine and IF lasers and to the development of a better fundamental understanding of electronic energy transfer. Previous research by our group in this broad area has investigated the kinetics of the equilibrium $I^* + O2 = I + O2(1 Delta)$, has measured electronic-to-vibrational energy transfer from I^* to I2, and has determined the rates of deactivation of I^* by alkyl and perfluoroalkyl iodides. During the past three years our efforts have focused on better ways to detect O2 (1 Delta), on the deactivation kinetics of I^* by Cl2, and on the photodisociative generation of iodine atoms. Sensitive detection of O2 (1 Delta by multiphoton ionization is reported. The deactivation of I^* by Cl2 is found to be much slower than previously thought. The photodissociation of ICN and CH3I have been examined. The relaxation of I^* by alkyliodides and perfluoroalkyliodides is reported. GRA

MEAN TRAJECTORY GAUSSIAN WAVE PACKET APPROACH TO ROTATIONALLY INELASTIC MOLECULE-SURFACE DIFFRACTION Annual Report
Bret Jackson and Horia Metiu Feb. 1986 12 p
(Contract N00014-81-K-0598)
(AD-A166275; TR-10) Avail: NTIS HC A03/MF A01 CSCL 20/10

The rotationally inelastic diffraction of H2 from a corrugated surface is investigated using a mean trajectory model. The center of mass motion is treated using Gaussian wave packets, which propagate on a rotationally averaged potential. This trajectory in turn drives the rotational transitions. The method is non-perturbative and allows for changes in mj, the rotational orientation, and agrees well with recent close coupling calculations. A connection is also made with the recent semiclassical trajectory work of DePrito. The effects of the attractive well depth on rotational excitation and diffraction are considered. GRA

MEASUREMENT OF ABSOLUTE EMISSION CROSS SECTIONS FOR EXTREME ULTRAVIOLET (EUV) PHOTONS IN THERMAL COLLISIONS OF METASTABLE HELIUM (2 SUP 1 S) WITH NEON AND HELIUM Thesis [MESSUNG ABSOLUTER EMISSIONSQUERSCHNITTE FUER EUV-PHOTONEN BEI THERMISCHEN STOESSEN VON METASTABILEM HELIUM (21S) MIT NEON UND HELIUM]
Guenter Hoffmann Jun. 1985 87 p In GERMAN
(MPIS-14/1985; ISSN-0436-1199; ESA-86-96901) Avail: NTIS HC A05/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 19

Under single-collision conditions EUV photons emitted in the collision of metastable He with Ne and He-atoms were directly observed in an atomic beam experiment. The EUV emission was measured as a function of collision energy. The emission cross sections were calibrated in absolute units. The method uses the natural decay photons of the free metastable He. Stueckelberg oscillations are resolved in the total cross section with Ne; Close-coupling calculations were performed for the dominant excitation process in He. A comparison between theory and measurements shows three onset thresholds for several photon groups, and the collision dynamics picture is clarified. In the collision system metastable He-He the deexcitation is determined as energy-dependent EUV emission. ESA

ORIENTATION EFFECTS AND FINE STRUCTURE TRANSITIONS IN DIFFERENTIAL SCATTERING CROSS SECTIONS Thesis [ORIENTIERUNGSEFFEKTE UND FEINSTRUKTURUEBERGAENGE IN DIFFERENTIELLEN STREUQUERSCHNITTEN]
E. Hasselbrink Jun. 1985 117 p In GERMAN
(MPIS-15/1985; ISSN-0436-1199; ESA-86-96902) Avail: NTIS HC A06/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 25

Theoretical fundamentals of the interaction between alkali and noble gas atoms are explained. The differential cross sections were determined in atomic beam experiments. The atomic beam was excited by a dye laser. A left-right polarization asymmetry was observed in the total differential cross section of the scattering of oriented K and Na-atoms in the first electronically excited state. The fine structures occurring in the asymmetry can be understood as remains of Stueckelberg oscillations. The asymmetry can be understood by the amplitude of the fine structure splitting in relation to the interaction between nuclear motion and electronic angular momentum. The fast oscillations in the total differential scattering cross section of the system K-Ne are determined and explained by a model potential calculation. Measurements of the differential cross section for fine structure transitions in the systems K-Ar, Kr, show directly Stueckelberg oscillations, confirming the asymmetry in the total cross section. A. Kaufhold Aug. 1985 231 p In GERMAN
(MPIS-16/1985; ISSN-0436-1199; ESA-86-97431) Avail: NTIS HC A11/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 46

The rotation-bending coupling of biatomic molecules during collision on corrugated solid state surfaces was theoretically investigated. The close-coupling calculations were drastically simplified using a cloud potential with simple structure. For relatively strongly corrugated surfaces and highly anisotropic molecules the so-called diffractive rotational selective adsorption resonances were identified. A modified Hantel pair potential model allowed the systematic investigation of processes related to resonances averaged over the change in global molecule mass. For H2-LiF(001) a potential hyperplane was calculated, based on additive, in pairs, two-particle interactions. The scattering intensity weakening was studied by a generalized optical potential model. A method which allows in a relatively simple way to simulate the Debye-Waller factor within close-coupling calculations, and which takes into account effects in the optical potential due to resonance processes was developed. ELEMENTARY REACTIONS OF ELECTRONICALLY EXCITED MOLECULES 6. QUENCHING OF O2(1 DELTA G) BY AMINES, FURANES, PYRROLES, AND THIOPHENES
W. Hack, C. Voehringer, and H. Gg. Wagner Sep. 1985 62 p
(MPIS-21/1985; ISSN-0436-1199; ESA-86-97433) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 18

The quenching of singlet oxygen was studied in an isothermal discharge flow system with dimol emission detection. The main carrier gas was He, the total pressure varied in the range 1 to 10 p/mbar. Room temperature quenching rate constants were obtained. The observation that quenching rate constants become pressure dependent at p < or = 3 mbar can be explained by taking into account heterogeneous contributions to the total loss rate. Above p = 3 mbar the reactions are simple homogeneous bimolecular reactions, first order in both O2 and quencher. No simple correlation between physical properties of the quenchers and the rate constants of their quenching reactions is found. The best quencher for O2 in the gas phase is 2,5 dimethylpyrrole. It can be used as a titrant. ESA

CROSS SECTION CALCULATIONS FOR SUBTHRESHOLD PION PRODUCTION IN PERIPHERAL HEAVY-ION COLLISIONS
John W. Norbury (Old Dominion Univ., Norfolk, Va.), Francis A. Cucinotta, Philip A. Deutchman (Idaho Univ., Moscow.), and Lawrence W. Townsend Aug. 1986 27 p
(Grant NSF PHY-84-11009)
(NASA-TP-2600; L-16129; NAS 1.60:2600) Avail: NTIS HC A03/MF A01 CSCL 20H

Total cross sections angular distributions, and spectral distributions for the exclusive production of charged and neutral subthreshold pions produced in peripheral nucleus-nucleus collisions are calculated by using a particle-hole formalism. The pions result from the formation and decay of an isobar giant resonance state formed in a C-12 nucleus. From considerations of angular momentum conservation and for the sake of providing a unique experimental signature, the other nucleus, chosen for this work to be C-12 also, is assumed to be excited to one of its isovector (1+) giant resonance states. The effects of nucleon recoil by the pion emission are included, and Pauli blocking and pion absorption effects are studied by varying the isobar width. Detailed comparisons with experimental subthreshold pion data for incident energies between 35 and 86 MeV/nucleon are made. Author

ELECTRON-ION RECOMBINATION IN AIR AT EMP FIELDS Technical Report, 16 Mar. 1984 - 16 Apr. 1985
J. G. Chervenak and V. A. J. vanLint 12 Jun. 1985 68 p
(Contract DNA001-84-C-0137; DNA Proj. X99-QMXV)
(AD-A166211; MRC/SD-R170; DNA-TR-85-202) Avail: NTIS HC A04/MF A01 CSCL 20/4

A pulsed electron beam and a parallel plate ion chamber have been used to measure the electron ion recombination coefficient, beta sub e, in dry and moist air as a function of the electric field. In moist air the value at 1000 V/cm (100,000 V/m) is in agreement with the value normally used in EMP calculations and results from the agglomeration and clustering of the air ions. An increase in beta sub e at lower fields is consistent with a recombination process in which H2O molecules act as a third body. The dry air results are a decade below the moist air values at a given field. Direct measurement of the equilibrium field, E sub s, was made and found to be consistent with the value expected from the measured recombination coefficient. The measured values of beta sub e and E sub s show that three-body recombination is not a significant electron removal process at EMP fields. GRA

THE REBATRON AS A HIGH ENERGY ACCELERATOR
D. Dialetis, S. J. Marsh, and C. A. Kapetanakos 4 Apr. 1986 85 p
(AD-A166624; NRL-MR-5655) Avail: NTIS HC A05/MF A01 CSCL 20/7

A detailed numerical and analytical study of the beam dynamics in a rebatron acceleration has shown that energies approaching 1 GeV can be achieved within 5-10 microseconds. Since the acceleration in the rebatron occurs within a short time, the device may not be sensitive to the various instabilities and the loss to synchrotron radiation should be small. The rapid acceleration is produced by convoluted parallel transmission lines, which provide a high gradient electric field. At the initial stage of the acceleration, the beam is confined inside the torus by a strong focusing torsatron magnetic field, which makes the beam insensitive to the mismatch and to the external field index of a vertical magnetic field. This local field is generated by two coaxial cylindrical plates located symmetrically around the minor axis of the torus, and carrying currents in opposite directions. The energy of the beam increases in synchronism with the vertical magnetic field so that the beam remains matched (i.e., the beam radius remains constant) during the entire acceleration. As a result of the periodic nature of the acceleration, it was found that resonances can be excited, which cause the orbits to expand. The only disruptive resonance occurs at gamma = approx. 1830, i.e., when the vertical magnetic field reaches twice the value of the toroidal magnetic field. GRA

GENERAL-PURPOSE HEAT SOURCE SAFETY VERIFICATION TEST SERIES: SVT-1 THROUGH SVT-6
D. Pavone, T. G. George, and C. E. Frantz Jun. 1985 43 p
(Contract W-7405-eng-36)
(DE85-017956; LA-10353-MS) Avail: NTIS HC A03/MF A01

The General-Purpose Heat Source (GPHS) is a modular heat source that will supply energy for Radioisotope Thermoelectric Generators (RTGs) in space missions. The Safety Verification Tests (SVTs) are performed to assess the plutonium containment capability of heat source modules subjected to certain accident environments. This interim report described the GPHS module configuration, the test environment, and the response of the module components following simulated reentry and solid Earth impact. The specific test environment of these initial six tests results from failure of the booster rocket to place the spacecraft in a proper trajectory and subsequent reentry of the GPHS modules from Earth orbit. IN SITU HIGH VOLTAGE ELECTRON MICROSCOPE STUDIES OF ION- AND ELECTRON-BEAM INDUCED MODIFICATION OF MATERIALS
P. R. Okamoto, N. Q. Lam, and A. Taylor Nov. 1985 10 p Presented at the International Symposium on Behavior or Lattice Imperfections in Materials: In Situ Experiments with HVEM, Osaka, Japan, 18 Nov. 1985
(Contract W-31-109-eng-38)
(DE86-005577; CONF-8511159-1) Avail: NTIS HC A02/MF A01

In situ high-voltage electron microscope (HVEM) studies have shown that the highly focused electron beams normally employed for irradiation purposes in the HVEM can cause easily measurable composition changes in the irradiated volume of thin alloy films (Ni-Al). The kinetics of this beam-induced composition change has been investigated and found to exhibit a strong dependence not only on temperature and peak electron flux, but also on the beam diameter. The dependence on beam diameter has far reaching implications for HVEM studies of radiation effects in alloys, and for microchemical analysis techniques. DOE

THE EFFECT OF ABERRATIONS AND APODISATION ON THE PERFORMANCE OF COHERENT IMAGING SYSTEMS Final Report, 3 Nov. 1983 - 30 Sep. 1984
J. P. Mills Feb. 1986 203 p
(Contract F29601-84-K-0014)
(AD-A165886; AFWL-TR-85-80) Avail: NTIS HC A10/MF A01 CSCL 14/5

The effect of aberrations on coherent imaging systems and the utility of apodisation in improving the performance of such systems was theoretically and experimentally investigated. The imaging performance of these systems was evaluated in terms of the images of certain simple objects--a point, two closely-spaced points, an edge, and a slit. Apodisation is defined as the deliberate modification of the amplitude transmittance of the exit pupil of the optical system. The effects on the imaging performance for various amounts of defocus, astigmatism, coma, and spherical aberration were determined for both unapodised and apodised systems. It is well known that for an aberration-free system, apodisation is effective in moderating the deleterious effects of the coherent imaging process. Since all real optical systems have aberrations, this dissertation addressed the more general case of apodisation in aberrated coherent imaging systems. It was found that apodisation was effective in improving the performance of these aberrated systems, i.e., ringing in the image of an edge or slit was greatly reduced and the mensuration error in the image of two points was almost eliminated. The performance of an unaberrated system was seen to be a special case. Experiments have been conducted which verified the theoretical model which was used to make extensive theoretical predictions. THE EFFECT OF BACKGROUND LUMINANCE AND AMBIENT ILLUMINATION ON COLOR DISCRIMINATION IN A CRT DISPLAY Interim Report
Alan R. Jacobsen 16 Jan. 1986 20 p
(AD-A166297; NSMRL-1070) Avail: NTIS HC A02/MF A01 CSCL 20/6

The ability to discriminate among colors presented on self-luminous displays, such as CRT monitors, continues to be an important area of research. It is widely agreed that when color is used for coding purposes in visual displays, the largest increase in performance will result when the colors used are easily discriminable from one another. A matching task was used to measure the effects of ambient illumination, raster luminance, and target size on color discriminability in a CRT display. A set of ten easily distinguishable colors was presented under two conditions of ambient illumination (dark and bright) and two conditions of raster luminance (low and intermediate). Below this set, a target color was presented as either a circle of 1.4 degrees diameter or a line 1.4 degrees high and 7 minutes wide. Observers were required to match this target with the appropriate color presented in the display above. Under the dark ambient illumination, the intermediate raster yielded faster response times and lower error rates than the low raster. Under the bright ambient, significantly more errors were made with the intermediate than low raster luminance. Color discriminability appears best under conditions where the background luminance is intermediate. Consequently, under dark ambient conditions, raster luminance should be set at an intermediate level but decreased as the ambient light decreases. GRA

CRITERIA FOR SELECTION OF GRADED INDEX FILTER MATERIALS BASED ON AN ANALYSIS OF WAVE PROPAGATION IN A PERIODIC MEDIUM Final Report, 10 Aug. 1984 - 28 Feb. 1985
Roger J. Becker Jan. 1986 142 p
(Contract F33615-82-C-5001)
(AD-A166809; AFWAL-TR-85-4129) Avail: NTIS HC A07/MF A01 CSCL 20/6

This report includes a survey of the factors affecting the performance of a filter. Although specifically directed at optical filters, most of the discussion is quite general, applying to the propagation of any wave in a medium with a spatially modulated response or susceptance. The intent of this work is to examine the factors affecting filter performance with a view toward perfecting filter design, to gain a deeper understanding of the relationship between rugate index profile parameters and the consequent optical properties, and to guide rugate deposition experiments. A wide range of systems which are usually treated as unique share important features with optical filters. Examples are acoustic filters, electronic energy bands in solid, lattice dynamics, transmission line theory, and waveguide theory. This report begins to lay the groundwork for development of an optimum transfer function and to determine the appropriate values for the filter parameters. GRA

FIBER OPTIC ROTARY SWITCHING DEVICE Patent Application
Stanley D. Battle, inventor (to Air Force) Filed 15 Jan. 1986 14 p
(AD-D012231; US-Patent-Appl-SN-818922) Avail: NTIS HC A02/MF A01 CSCL 20/6

A fiber optic rotary switching device having a single optical fiber rotatable between a plurality of optical fibers is described. The arrangement for rotating the single optical fiber is designed such that the single optical fiber flexes but does not twist with respect to an end thereof which is fixed to a light source (or, in the alternative to a light detector). As a result, the switching device switches light passing through the single optical fiber to a preselected one of the plurality of optical fibers while simultaneously preventing extraneous light from reaching the other optical fibers. STIMULATED RAMAN SCATTERING: COMPARISON OF THEORY AND EXPERIMENT
R. L. Berger, G. E. Busch, E. F. Gabl, R. J. Schroeder, C. L. Shepard, and J. A. Tarvin 1985 12 p Presented at the 7th International Workshop on Laser Interaction and Related Plasma Phenomena, Monterey, Calif. 28 Oct. 1985
(Contract DE-AC08-82DP-40152)
(DE86-006480; KMSF-U-1671; CONF-851053-10) Avail: NTIS HC A02/MF A01

Experiments at KMSF and elsewhere have observed stimulated Raman scattered light whose energy is correlated with the energy in hot electrons as expected, on the basis of energy conservation in the three wave process (Manley Rowe relations). The instability is observed under conditions that are below the theoretical threshold for the convectively unstable interaction, and above that for the absolutly unstable interaction. However, the spectral characteristics are those of the convective modes. The laser intensity threshold is measured to be independent of the plasma density scale length, rather than inversely dependent on the scale length as theoretically predicted if the threshold is defined by the observation of SRS light. However, the amount of SRS light increases exponentially with laser intensity as expected for a convective instability. The SRS light is typically concentrated in rather short wavelengths where the associated Langmuir wave should be strongly damped. These spectral characteristics are not explained by the wavelength variation of the gain or the bremsstrahlung light wave source. Calculations were given to show that

the Langmuir wave source has the right properties to reproduce the observed spectra. DOE

VERSATILE LASER GLASS INSPECTION AND DAMAGE TESTING FACILITY
J. E. Marion, G. J. Greiner, J. H. Campbell, P. H. Chaffee, J. S. Hildum, J. Z. Grens, C. L. Weinzapfel, S. M. Winfree, and D. Milam 17 Jan. 1986 11 p Presented at the Boulder Damage Symposium, Boulder, Colo. 5 Oct. 1985
(Contract W-7405-eng-48)
(DE86-006306; UCRL-93251; CONF-8510101-4) Avail: NTIS HC A02/MF A01

A test facility is described which detects small opaque inclusions in large transparent components by using a commercial laser which delivers high energy pulses to the test sample at moderate frequency in a small diameter beam. The sample is automatically scanned such that each point in the volume is irradiated with ten pulses at twice the inclusion damage threshold - an amount sufficient to cause visible damage at inclusion sites. This approach permits detection of opaque inclusions in the parts per trillion and lower concentration range. The specifics of the device design and its performance are discussed in the context of automatic inclusion inspection and mapping in large laser optics. DOE

VARIED LINE-SPACE GRATINGS: PAST, PRESENT AND FUTURE
M. C. Hettrick Aug. 1985 16 p Presented at the SPIE International Technical Symposium on Optical and Electro-Optical Engineers, San Diego, Calif., 18 Aug. 1985
(Contract DE-AC03-76SF-00098)
(DE86-007498; LBL-20115; CONF-850887-44) Avail: NTIS HC A02/MF A01

A classically ruled diffraction grating consists of grooves which are equidistant, straight and parallel. Conversely, the so-called holographic grating (formed by the interfering waves of coherent visible light), although severely constrained by the recording wavelength and recording geometry, has grooves which are typically neither equidistant, straight nor parallel. In contrast, a varied line-space (VLS) grating, in common nomenclature, is a design in which the groove positions are relatively unconstrained yet possess sufficient symmetry to permit mechanical ruling. Such seemingly exotic gratings are no longer only a theoretical curiosity, but have been ruled and used in a wide variety of applications. These include: (1) aberration-corrected normal incidence concave gratings for Seya-Namioka monochromators and optical demultiplexers, (2) flat-field grazing incidence concave gratings for plasma diagnostics, (3) aberration-corrected grazing incidence plane gratings for space-borne spectrometers, (4) focusing grazing incidence plane grating for synchrotron radiation monochromators, and (5) wavefront generators for visible interferometry of optical surfaces (particularly aspheres). Future prospects of VLS gratings as dispersing elements, wavefront correctors and beam-splitters appear promising. The author discusses the history of VLS gratings, their present applications, and their potential in the future. DOE

NEW ACOUSTO-OPTICAL BEAM FORMER Final Report, Dec. 1983
Dirk Rathjen Bonn Bundesministerium fuer Forschung und Technologie Dec. 1985 67 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-85-154; ISSN-0340-7608; ESA-86-97440) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 14

A laboratory model of an optically incoherent processor which can be used for beam forming on linear antenna arrays is described. The individual electronic sensor signals are converted into light. The beam forming is achieved by spatial filtering of the overall light distribution in an acousto-optical modulator. For narrow-band signals, the array beam pattern is controlled by varying the spatial frequency of the sinusoidal filter function. The theoretical fundamentals of the processor, and measurement results with synthetic and real underwater sound signals are presented. The signals of an eight-sensor array can be processed. A dynamic range of 35 dB is achieved without particularly high technical complexity. Although the laboratory model is a large, heavy structure which is not suitable for practical use, the concept, when applied to other technologies, opens up possibilities for the development of small, light-weight modules for large arrays. FIBER OPTICAL DATA LINK EXTENSION FOR THE IEC-625 INTERFACE BUS
Gerd-Jan Dijkers Dec. 1984 81 p
(ESA-86-97532) Avail: NTIS HC A05/MF A01

A fiber optics device capable of extending the limited length of 20 m of a normal IEC-bus to 5 km was designed. Maximum throughput rate of 1 Mbyte/sec is feasible, with slower throughput rates in the command mode, which is acceptable when the number of bytes in the command mode is much smaller. Software changes in the controller are necessary when it is desirable to empty the FIFO-memory of the device. When these software changes are not made, it is possible that data bytes, stored in the FIFO-memory during the data mode, can not get out of this memory and are lost. No parallel poll possibilities exist for the extended devices. ESA

DESIGN AND FABRICATION OF AN ACTIVELY COOLED LANGMUIR PROBE FOR LONG PULSE APPLICATIONS
J. A. Paterson, L. A. Biagi, K. W. Ehlers, and G. W. Koehler Nov. 1985 4 p Presented at the 11th Symposium on Engineering Problems in Fusion Research, Austin, Tex., 18 Nov., 1985
(Contract DE-AC03-76SF-00098)
(DE86-005231; LBL-19531; CONF-851102-77) Avail: NTIS HC A02/MF A01

The details of the mechanical design and fabrication for a Langmuir Probe for the continuous monitoring of plasma density are given. The probe was designed for use as a diagnostic tool in the development of long pulse positive ion plasma sources for use on neutral beam systems. The essential design feature of this probe is the incorporation of two electrically isolated cooling water circuits which actively cool the probe tip and probe jacket.

The electrical isolation is required to prevent drain currents from the probe body disturbing the measurement of the probe tip current and thereby the plasma density measurement. The successful realization of the design requires precision components and vacuum tight ceramic to refractory metal brazes. To date this design has successfully operated in steady-state in plasma densities up to 250 mA/cm² and surface heat fluxes of 25 W/cm². DOE

MEASUREMENT OF POPULATION INVERSIONS AND GAIN IN CARBON FIBER PLASMAS
H. Milchberg, C. H. Skinner, S. Suckewer, and D. Voorhees Oct. 1985 16 p
(Contract DE-AC02-76CH-03073)
(DE86-002532; PPPL-2274) Avail: NTIS HC A02/MF A01

A CO2 laser (approx. 0.5 kJ energy, 70 nsec pulse width) was focussed onto the end of an axially oriented, thick (35-350 microns)carbon fiber with or without a magnetic field present along the laser-fiber axis. Evidence is presented for axial-to-transverse enhancement of the CVI 182A (n = 3 + 2) transition, which is correlated with the appearance of a population inversion between levels n = 3 and 2. For the B = O kG, zero field case, the maximum gain-length product of kl approx. equal to 3 (k approx. equal to 6/cm) was measured for a carbon fiber coated with a thin layer of aluminum (for additional radiation cooling). The results are interpreted in terms of fast recombination due mostly to thermal conduction from the plasma to the cold fiber core. Author

GENERALIZED BANANA-DRIFT TRANSPORT
H. E. Mynick Oct. 1985 50 p
(Contract DE-AC02-76CH-03073)
(DE86-002535; PPPL-2271) Avail: NTIS HC A03/MF A01

The theory of tokamak ripple transport in the banana-drift and ripple-plateau is extended in a number of directions. The theory is valid for small values of the toroidal periodicity number n of the perturbation, as well as for the moderate values (n approx. 10 - 20) previously assumed. It is shown that low-n perturbations can produce much greater transport than the larger-n perturbations usually studied. In addition, the ripple perturbation is allowed arbitrary values of poloidal mode number m and frequency omega, making it applicable to the transport induced by MHD modes. Bounce averaging is avoided, so the theory includes the contributions to transport from all harmonics of the bounce frequency, providing a continuous description of the transition from the banana drift to the ripple-plateau regime. The implications of the theory for toroidal rotation in tokamaks are considered. Author

RESISTIVE INSTABILITIES IN TOKAMAKS
P. H. Rutherford Oct. 1985 35 p
(Contract DE-AC02-76CH-03073)
(DE86-002538; PPPL-2277) Avail: NTIS HC A03/MF A01

Low-m tearing modes constitute the dominant instability problem in present-day tokamaks. The stability criteria for representative current profiles with q(0)-values slightly less than unity are reviewed; 'sawtooth' reconnection to q(0)-values just at, or slightly exceeding, unity is generally destabilizing to the m = 2, n = 1 and m = 3, n = 2 modes, and severely limits the range of stable profile shapes. Feedback stabilization of m less than or equal to 2 modes by rf heating or current drive, applied locally at the magnetic islands, appears feasible; feedback by island current drive is much more efficient, in terms of the radio-frequency power required, than feedback by island heating. Feedback stabilization of the m = 1 mode -- although yielding particularly beneficial effects for resistive-tearing and high-beta stability by allowing q(0)-values substantially below unity -- is more problematical, unless the m = 1 ideal-MHD mode can be made positively stable by strong triangular shaping of the central flux surfaces. Feedback techniques require a detectable, rotating MHD-like signal; the slowing of mode rotation -- or the excitation of non-rotating modes -- by an imperfectly conducting wall is also discussed. TECHNICAL ISSUES AND REQUIREMENTS OF EXPERIMENTS AND FACILITIES FOR FUSION NUCLEAR TECHNOLOGY, FINESSE PHASE 1, VOLUME 2
Dec. 1985 654 p
(Contract DE-AS03-84ER-52105)
(DE86-006503; PPG-909-Vol-2; UCLA-ENG-85-39-Vol-2) Avail: NTIS HC A99/MF A01

Liquid metal blankets are discussed with respect to the critical issues, existing facilities, basic measurements, modeling techniques, material interactions, insulators, electromagnets, and tritium recovery. These topics are also discussed with regard to solid breeder blankets. In addition, tritium processing, vacuum systems, and plasma interactive components are discussed. Existing fusion facilities are described, and blanket development planning is discussed. DOE

TWO DIMENSIONAL ANALYTICAL CONSIDERATIONS OF LARGE MAGNETIC AND ELECTRIC FIELDS IN LASER PRODUCED PLASMAS
S. Eliezer and A. Loeb (Soreq Research Establishment, Israel Atomic Energy Commission, Yavneh.) Aug. 1985 25 p
(DE86-00235; DOE/ET-53088/200) Avail: NTIS HC A02/MF A01

A simple model in two dimensions is developed and solved analytically taking into account the electric and magnetic fields in laser produced plasmas. The electric potential in this model is described by the nonlinear differential equation d-squared psi/dx-squared + psi(d psi/dx)/(1 - psi) = 0, psi = (e phi)/T, where (e phi) is the electric potential energy and T is the temperature in energy units. The physical branch psi < 1, defined by the electron density n = n(0) exp psi boundary conditions n(x = 0) = const and n(x = (+)infinity) = 0, introduces a typical electrostatic double layer. The stationary solution of this model is consistent for -0.1 approx. < psi < 1, with electron temperature in the KeV region and a ratio of the electric (E) to magnetic (B) fields of [E/10(6) v/cm]/[B/MGauss] being approximately 1. RADIAL DISTRIBUTION OF EXCITED ATOMS IN A PLASMA COLUMN PRODUCED BY A SURFACE WAVE [DISTRIBUTION RADIALE DES ATOMES EXCITES DANS UNE COLONNE DE PLASMA PRODUITE PAR UNE ONDE DE SURFACE]
C. M. Barbeau, H. Hubert, M. Moisan, and A. Ricard Jan. 1986 52 p In FRENCH
(LP-214; ESA-86-97187) Avail: NTIS HC A04/MF A01

The radial distribution of excited states of He, Ne and Ar were studied either individually or in mixtures with one another and with O2. The plasma columns are produced by a high frequency wave (300 to 1000 MHz) propagating along the tube surface and penetrating radially. The flat profiles obtained are related to the propagation of the radial electric field which follows a modified Bessel function, where its parameter is a function of the electron density. The spectrum lines of metastable states present positive curvature profiles, while those of the fundamental states are more often of negative curvature. In the condition of high power absorption obtained by multiple reflexions the concentration of metastable states is very high and the radial distribution profile is flat. ESA

STUDY OF SURFACES AND SURFACE LAYERS ON HIGH TEMPERATURE MATERIALS AFTER SHORT-TIME THERMAL LOADS
H. Bolt, H. Hoven, K. Koizlik, J. Linke, H. Nickel, and E. Wallura Nov. 1985 77 p
(JUEL-2024; ISSN-0366-0885; ESA-86-97422) Avail: NTIS HC A05/MF A01

Erosion and redeposition processes of first wall materials during

tokamak operation are discussed. An important redepareition process of eroded material is the formation of thin films by atomic condensation. Examinations of first wall components after operation suggest that these thin metallic films tend to agglomerate to small particles under subsequent heat load. Laboratory experiments show that thin metallic films on various substrates can agglomerate under short time high heat fluxes and also under longer lasting lower thermal loads, thus verifying the agglomeration hypothesis. ENHANCED SMALL SCALE TURBULENCE OSCILLATIONS CORRELATED TO SAWTOOTH RELAXATIONS IN THE TEXTOR TOKAMAK
A. Rogister, G. Hasselberg, A. Kaleck, A. Boileau, H. W. H. VanAndel, and M. vonHellermann Nov. 1985 34 p
(JUEL-2025; ISSN-0366-0885; ESA-86-97423) Avail: NTIS HC A03/MF A01

A periodic enhancement of the microturbulence level by sawtooth relaxations was detected by CO2 laser forward scattering in the TEXTOR tokamak. This feature is reproduced quantitatively by a heat transport code in which the anomalous electron transport coefficient is calculated self consistently following a theoretical model of the saturation of the dissipative trapped electron instability. The code also predicts a strong modulation of the heat flux throughout the whole plasma and a strong profile consistency as continuous temperature measurements demonstrate. Calculated global plasma parameters, such as the energy confinement time and the loop voltage, are in good agreement with the measured values. ESA

AN INVESTIGATION OF DISCHARGE STRUCTURES IN THE SUBMILLIMETER BAND IN AN MHD GENERATOR [EEN ONDERZOEK NAAR ONTLADINGSSTRUCTUREN IN HET SUB-MILLIMETERGEBIED IN EEN MHD GENERATOR]
H. J. W. Schenkelaars Aug. 1984 96 p In DUTCH
(VDF-NT-84-16; ESA-86-97549) Avail: NTIS HC A05/MF A01

The characteristic length scale of the discharge structure occurring in an MHD generator was determined using collective scatterings of CO2 laser light and heterodyne detection techniques. Mixing of scattered and nonscattered radiation was used to get a spatial resolution in the submillimeter range and to increase the signal to noise ratio. A discharge model to interpret the measured signals was formulated. The length scale of the electron density fluctuations of (2.5 + or - 0.5) x 0.0001 m is found. The smallest diameter of the substructure is explained by elaborating particle and energy balance equations. A characteristic discharge diameter of (2 to 4) x 0.0001 m for electron temperatures between 2500 and 4000 K and a 3000 V/m electric field is found by balancing Joule dissipation and electron heat conductivity terms. For temperatures falling outside the temperature field, terms lost become of increasing importance, probably due to radiation processes and dissociative recombination. ESA

A SUPERCONDUCTING TUNNEL JUNCTION RECEIVER FOR MILLIMETER-WAVE ASTRONOMY
Shing-Kuo Pan and Anthony R. Kerr Jul. 1986 243 p
(NASA-TM-87792; NAS 1.15:87792) Avail: NTIS HC A11/MF A01 CSCL 20L

The development and construction of an ultralow noise heterodyne receiver for millimeter wave astronomy is described along with its use for 115.3 GHz Co line observations. The receiver uses a Superconductor-Insulator-Superconductor (SIS) quasiparticle tunnel junction mixer to convert the millimeter wave signal to a microwave intermediate frequency. Experiments aimed at quantitative verification of J. R. Tucker's quantum mixer theory are studied, to see whether it could be used as the basis for the design of a practical receiver. The experimental results were in excellent agreement with the theory, assuming the three frequency approximation. Infinite available gain and negative output resistance were observed for the first time, nonclassical effects which are not seen in conventional diode mixers. Using Tucker's theory, an SIS receiver was then designed and constructed. At 115 GHz, the single sideband receiver noise temperature is 83K, the lowest ever reported in this frequency range. A CO survey toward Cygnus-X region, using this SIS receiver on the Columbia-GISS 4 ft. telescope, is also described. Author

The solution crystallization method was used to obtain Ga(z)in (1-x)P alloys for all values of x desired between zero and 1. The method of preparation makes it possible to crystallize the solid at a constant temperature. The points obtained by cathodoluminescence are nearly in straight lines. The optical absorption thresholds are confirmed in the results and make it possible to define the nature of the transitions except when x is in the neighborhood of 0.65. These determinations agree with those of Hilsum and Porteus (1968), but are not in agreement with those obtained by Lorenz et al, (1968). Author

SEMICONDUCTING TRANSITION METAL SILICIDES FOR ELECTRO-OPTIC VSLI INTERCONNECTS Interim Report
John E. Mahan 15 Jan. 1986 6 p
(Contract N00014-85-C-0874)
(AD-A165895; IR-3) Avail: NTIS HC A02/MF A01 CSCL 20/12

We have optically characterized the CrSi2 samples, and fabricated thin films of MnSi(1.7) and IrSi(1.75). X-ray analysis of the latter two silicides has also been accomplished. These developments are summarized. A forbidden energy gap of approx. 0.3eV is obtained from the onset of strong absorption at that energy. The interference fringes correspond to a refractive index-film thickness product of approx. 10 microns; the estimated film thickness of 2.4 microns gives a refractive index of approximately 4.2 below the absorption edge. Thin films of this material were formed by ion beam sputtering and furnace reaction techniques as described for CrSi2 in our first progress report. X-ray diffraction analysis of the films confirms the presence of the semiconducting manganese silicide, with no other detectable phase except the silicon substrate. A representative X-ray diffraction pattern for a film formed at 750C is shown. Again, the data indicate the well-crystallized semiconducting silicide phase and no other except for the silicon substrate. GRA

A theoretical research program directed toward the study of the energetics and LWIR radiative properties of selected uranium/oxygen band systems has been undertaken. Included in this research program was the investigation of the strongest electronic and vibrational bands in the LWIR region for the species UO, UO(+), UO2, UO(++). The program for accomplishing this research effort was formulated into three separate tasks: a) adaption of our electronic structure codes to the DNA CYBER 176 System, b) calculation of pertinent electronic wavefunctions and energies, as a function of internuclear separation within a relativistic framework, for selected species of the uranium/oxygen system which may be important in the LWIR region, and c) calculation of electronic transition moments and transition probabilities between specific vibrational levels of the electronic states corresponding to the strongest radiating band systems belonging to the uranium/oxygen system and prediction of IR and possible optical oscillator strengths. Our calculations indicated that the species UO(+) will be efficiently solar pumped and will exhibit strong absorption/radiation. Further, we predict efficient conversion of solar photons to IR photons for this species. GRA

SUPERCONDUCTING ELECTRONIC FILM STRUCTURES Semi-annual Report, 1 Jan. - 30 Jun. 1985
A. I. Braginski and J. R. Gavaler 5 Aug. 1985 20 p
(Contract F49620-85-C-0043)
(AD-A166183; Rept-85-9C9-SUPER-R2; AFOSR-86-0097TR) Avail: NTIS HC A02/MF A01 CSCL 20/12

Data from Nb/Sn and Nb/Al diffusion couple experiments provided supporting evidence for a proposed hypothesis that superconducting A15 compounds are formed via an oxygen catalyzed reaction. Both epitaxy, and the addition of an impurity (carbon) were successful in increasing the critical temperatures of NbN deposited at low temperature. Critical temperatures of over 16K were obtained in epitaxially grown NbN films sputtered on substrates held at less than 100 C. RHEED (reflection high energy electron diffraction) and X-ray rocking curve data show that the new UHV deposition and analytical facility has the capability for epitaxially growing high quality single crystals of the technologically important A15 and B1 superconductors. Low-leakage all-NbN tunnel junctions have been developed with ion-beam oxidized Al and Mg barriers, or rf-sputtered MgO barriers. The first Nb-Sn based junctions with refractory counterelectrodes were fabricated. XPS, RHEED, and tunneling have been used to characterize: (1)the structure of epitaxial films, (2)the role of ion-beam oxidation in the preparation of tunnel barriers that can be used with refractory counter electrodes, and (3)anisotropic surface oxide growth on single crystal films. Nb single crystal films were prepared which have three times lower rf surface losses compared to polycrystalline Nb. Author (GRA)

COMPARATIVE STUDIES OF ELECTRON AFFINITIES AND WORK FUNCTIONS FOR GaAs AMD Si
Yirong Xing 14 Mar. 1986 20 p Transl. into ENGLISH from Bandaoti Xuebao (China), v. 6, no. 4, Jul. 1985 p 362-368
(AD-A166225; FTD-ID(RS)T-1181-85) Avail: NTIS HC A02/MF A01 CSCL 07/4

Ultra-violet Photoemission Spectra (UPS) involving core level photoemission peaks (Ga 3d for GaAs and Si 2p for Si) is measured for the (111), (110), (111), and (001) surfaces of GaAs and Si using the light from a Helium lamp (21.2 eV and 40.8 eV) and from the Berlin synchrotron radiation source BESSY (108.6 eV), respectively. These surfaces are prepared by ion bombardment and annealing on cylindrically shaped GaAS and Si crystals with 110 as their axis. The GaAs cylinder is in addition prepared by molecular beam epitaxy yielding As-rich phases on (111) and (001). The work function Phi and the electron affinity x are evaluated from the low energy (secondary electron) threshold and the energy position of the core level photoemission peak. It is shown that due to the crystal polarity and differences in surface composition, the electron affinity depends strongly on the orientation for GaAs. For Si, the missing bulk polarity is responsible for the small variations of X, which may be caused by the different surface reconstructions. On GaAs, the Variation of Phi and X are essentially parallel indicating no strong band bending variations. On Si, however, the relatively strong variations of Phi indicate strong variations of the band bending. GRA

EXPERIMENTAL STUDY OF ELECTRONIC STATES AT METAL-DIELECTRIC INTERFACES Interim Technical Report, 2 Feb. 1981 - 1 Feb. 198
A. J. Sievers 23 Dec. 1985 21 p
(Grant AF-AFOSR-0121-81)
(AD-A166242; AFOSR-86-0077TR) Avail: NTIS HC A02/MF A01 CSCL 07/4

By means of new infrared techniques we are exploring both the time and frequency domain spectra of electronic interface states. These data can be used to obtain information specific to interfaces such as mobility and diffusion, lifetimes, energy levels and the density of states. We shall continue the development of new infrared techniques which are ideally matched to the interface problem and then use these techniques to measure and characterize the physical properties of electronic states at metal-dielectric interfaces. Since these techniques rely on evanescent electromagnetic waves a closely related objective is to explore the near field electrodynamics of structures which produce evanescent fields. Metal semiconductor interfaces can be studied with broadband SEW spectroscopy using incoherent thermal radiation for a source and the surface photoconductivity for a detector. With coherent sources power dependent absorption measurements and also light scattering from surface electrokinetic phenomena become feasible. These instruments will not only be used to probe the excitation spectra of metal-semiconductor interface states but also to explore the magnetic field dependence of the energy levels in n-type InSbNiSb eutectic. SUPERCONDUCTIVITY OF THIN FILM INTERMETALLIC COMPOUNDS Annual Report, 1 Sep. 1984 - 31 Aug. 1985
Allen M. Goldman 15 Sep. 1985 53 p
(Grant AF-AFOSR-0347-84)
(AD-A166271; AFOSR-86-0155TR) Avail: NTIS HC A04/MF A01 CSCL 20/3

The macroscopic as well as microscopic properties of selected thin film superconducting compounds are being investigated. The materials being studied are either members of technologically significant systems or involve possible unique mechanisms for superconductivity whose realization should extend the range of critical parameters to either higher temperatures of higher critical fields. Materials under study are the superconducting Cheverel phase compounds, selected Heavy Fermion compounds and a low carrier density superconductor, T1 doped PbTe. The latter is being investigated with an idea to understanding the superconduc-

ting field effect. Processing of the Chevrel Phase compounds is carried out in a multi-source deposition system. The latter has been upgraded and improved during the grant period. The electrical and magnetic properties of the reentrant superconductor HoMo6S8 have been investigated in some detail with the magnetic and superconducting character of the low-temperature phase found to be dependent on the degree of disorder in the film. Single crystal films of the Heavy Fermion compound UPt3 have been prepared. Although these films are highly ordered they have not been found to be superconducting, perhaps because they are off stoichiometry by as little as one percent. GRA

ON THE INTERPLAY BETWEEN CHEMICAL REACTIONS AND PHASE TRANSITIONS FOR MOLECULES ADSORBED ON SOLID SURFACES Annual Report
Mark Stiles and Horia Metiu Feb. 1986 28 p
(Contract N00014-81-K-0598)
(AD-A166273; TR-15) Avail: NTIS HC A03/MF A01 CSCL 07/4

There is a large body of experimental evidence suggesting that the rate of product formation in a reaction between adsorbed molecules is deeply modified when one of the reagents undergoes a phase transition or, more broadly speaking, an aggregation of some kind. Specific examples are: H2 and CO oxidation; methanol transformation into a methoxy radical on O/Cu; the water reaction with oxygen to form 2OH; the decomposition of N2O on Pt(111) which is affected by a phase transition in the outermost Pt layer; and the oxidation of Ni7. It is suspected that similar effects might operate on supported metal catalysts. We use Monte Carlo simulations to examine the manner in which reagent aggregation affects the reaction rate between molecules adsorbed on a solid surface. We discuss the temperature and concentration dependence of the rate of product formation. GRA

Novel high resolutions electromagnetic wave techniques have been used in the optical, infrared and far infrared spectral regions to explore the electronic states at metal dielectric interfaces. Because infrared surface plasmons on metal surfaces propagate for many wavelengths, a measurement of the transmission of these surface excitations has proven to be a sensitive probe of the surface itself. Both broadband and single frequency generation techniques have been developed. Reconstructed surfaces as well as surfaces covered with a chemisorbed atomic monolayer or a thin dielectric or molecular film have been investigated with these new methods. GRA

A MULTIPLE GAUSSIAN WAVE PACKET THEORY OF H2 DIFFRACTION AND ROTATIONAL EXCITATION BY COLLISION WITH SOLID SURFACES Annual Report
Bret Jackson and Horia Metiu Feb. 1986 43 p
(Contract N00014-81-K-0598)
(AD-A166291; TR-11) Avail: NTIS HC A03/MF A01 CSCL 07/4

The Gaussian wave packets and the coupled channel method are combined to develop a theory of H2 diffraction and rotational excitation by collision with surfaces. This improves our previous work on H2 diffraction since it eliminates the mean trajectory approximation; it also extends Heller's work to problems in which the dynamics require the creation of new packets which must be coupled to each other as they are propagated through the interaction region. The approximations involved in the above Gaussian wave packet approach can be removed by extending a method proposed by Flect, Morris and Felt, which propagates the Gaussian wave function exactly and efficiently. (AD-A166385) Avail: NTIS HC A02/MF A01 CSCL 20/12

The dielectric theory of Phillips and Van Vechten defines crystalline ionicity in terms of optical properties and predicts first-order structural phase transitions. Their approach, while very successful, is, nonetheless, empirical and has yet to be justified via an ab initio quantum mechanical approach. We present such an approach for examining the relationship between spectroscopic crystal ionicity and spatial structure. We demonstrate that the structural predictions based on ionicity scales derived from the dielectric theory are consistent with a microscopic point of view. Pseudopotential radii are used to sort ternary systems. By and large the sorting is only slightly better than that found using ionic radii, although the use of a third parameter allows sorting of the spinel and Cr3S4 types. GRA

FERROELECTRIC TUNGSTEN BRONZE CRYSTALS FOR FAR INFRARED ELECTRO-OPTIC DEVICE APPLICATIONS Final Report, 12 Jan. 1983 - 30 Sep. 1985
R. R. Neurgaonkar Nov. 1985 47 p
(Contracts DAAK70-83-C-0016; AF Proj. 2131)
(AD-A166484; SC5356.56FR) Avail: NTIS HC A03/MF A01 CSCL 20/2

The primary objective of this research program is to develop for electro-optic and nonlinear optical applications high quality, striation-free crystals of a number of interesting tungsten bronze compositions such as Ba(2-x)Sr(x)K(1-y)Na(y)Nb5O15 (BSKNN), Ba6Ti2Nb8O30 (BTN), and a few compositions which are close to a morphotropic phase boundary, using the Czochralski and edge defined crystal growth techniques. The large transverse and longitudinal electro-optic response obtainable near morphotropic phase boundaries are studied in particular detail for optical device applications. A second objective is to improve material photorefractive performance using selected dopants. Several undoped and doped tungsten bronze BSKNN-1 and BSKNN-2 single crystals have been grown by the Czochralski technique. Optical evaluation shows that both the crystals show minimum striations, and are useful for optical studies. Current growth results suggest that the existence of striations depends on the type of dopant and the purity of starting materials. Both BSKNN-1 and BSKNN-2 crystals show excellent ferroelectric and optical properties which are similar to perovskite BaTiO3 rather than to tungsten bronze SBN:60 single crystals. The unit cells for BSKNN-1 and BSKNN-2 are slightly bigger than SBN:60 crystal and for these small changes their entire ferroelectric properties are different. GRA

CONTRIBUTIONS OF ELECTRON MICROSCOPY TO THE UNDERSTANDING OF REACTIONS ON COMPOUND SEMICONDUCTOR SURFACES
T. Sands Nov. 1985 19 p Presented at the Materials Research Society Meeting, Boston, Mass., 2 Dec. 1985 Prepared in cooperation with California Univ., Lawrence Berkeley Lab.
(Contract DE-AC03-76SF-00098)
(DE86-005230; LBL-20509; CONF-851217-27) Avail: NTIS HC A02/MF A01

Reacted films on compound semiconductor substrates present challenging materials characterization problems which often require the application of transmission electron microscopy (TEM) techniques. In this paper, both the problem-solving potential of the TEM techniques and the limits imposed by preparation of thin film/compound semiconductor TEM specimens are discussed. Studies of the Ni/GaAs, CuCl(aq)/CdS and Pd/GaAs reactions exemplify the role of TEM in identifying and determining the spatial distribution of interface-stabilized polymorphs and new ternary phases (e.g., tetragonal CuS, NiGaAs and Pd/sub x/GaAs). These examples also serve to clarify the relationship between TEM and complementary analysis techniques such as Rutherford backscattering spectrometry, Auger electron spectroscopy and glancing-angle x-ray diffraction. In particular, it is argued that a combination of (1) high-spatial-resolution information obtained by TEM and (2) an indication of the average behavior provided by data from a complementary characterization technique provide the minimum quality and quantity of data necessary to understand most reactions on compound semiconductor substrates. POINT DEFECTS AND HIGH-TEMPERATURE DEFORMATION OF NiO
K. C. Goretta and J. L. Routbort 1985 9 p Presented at the Materials Research Society Meeting, Boston, Mass., 2 Dec. 1985
(Contract W-31-109-eng-38)
(DE86-005560; CONF-851217-30) Avail: NTIS HC A02/MF A01

The steady-state flow stress tau(sub s) in nonstoichiometric NiO single crystals has been measured in the temperature range of 1428 to 1653 K with oxygen partial pressures p(O2) between 6 and 1 x 10 to the 5th power Pa. Strain rates epsilon were varied from 1 x 10 to the -5 power to 2 x 10 to the -3 power/sec. Transmission electron microscopy indicates that dislocation climb is the primary mechanism of recovery. Because dislocation climb is diffusion controlled, the data may be described at fixed temperature by epsilon = A tau(sub s)(sup n) p(O2)(sup 1/m), where n is the stress exponent and m is a parameter that is determined by the dominant atomic defects on each sublattice. At high temperatures and p(O2) > 2 x 10 to the 4th power Pa, n was found to be in agreement with dislocation-climb models; however, n increased at low p(O2) owing to effects of impurities. The values of m are consistent with control of climb rate by diffusion of singly charged oxygen vacancies for low p(O2) and by diffusion of neutral oxygen interstitials for high p(O2). At lower temperatures, the values of n are strongly affected by dislocation/impurity interactions for all p(O2). DOE

LIGHT-INDUCED EXCESS CONDUCTIVITY AND THE ROLE OF ARGON IN THE DEPOSITION OF DOPING-MODULATED AMORPHOUS SILICON SUPERLATTICES
F. C. Su, S. Levine, P. E. Vanier (Brookhaven National Lab., Upton, N. Y.), and F. J. Kampas 1985 6 p Presented at the Materials Research Society Meeting, Boston, Mass., 2 Dec. 1985 Prepared in cooperation with Brookhaven National Lab., Upton, NY.
(Contract DE-AC02-76CH-00016)
(DE86-005812; BNL-37573; CONF-851217-39) Avail: NTIS HC A02/MF A01

Amorphous semiconductor superlattice structures consisting of alternating n-type and p-type doped layers of hydrogenated amorphous silicon (a-Si:H) have been made by silane glow discharge in a single chamber system. These multilayered films show the novel phenomenon of light-induced excess conductivity (LEC) associated with a metastable state having a lifetime on the order of days. This report shows that the LEC effect is quite dependent on the specific details of the deposition parameters, namely dilution of the silane with inert gas, substrate temperature and layer thickness. In order to investigate the origin of the LEC effect, argon dilution was used for specific regions of the structure. This experiment shows that the slow states are distributed throughout the layers, and are not concentrated at the interfaces. DOE

MICROSTRUCTURAL DYNAMICS OF PRIMARY AND SECONDARY RECRYSTALLIZATION
M. P. Anderson, G. S. Grest, and D. J. Srolovitz (Los Alamos National Lab., N. Mex.) 1985 18 p Presented at the Computer Simulation of Microstructural Evolution Symposium, Toronto, Ontario, 14 Oct., 1985 Prepared in cooperation with Los Alamos National Lab., NM.
(Contract W-7405-eng-36)
(DE86-006046; LA-UR-86-421; CONF-8510273-1) Avail: NTIS HC A02/MF A01

Monte Carlo computer simulation techniques have been applied to the problem of recrystallization in a two dimensional matrix. Both primary and secondary recrystallization are investigated. Primary recrystallization is modelled under conditions where the degree of stored energy is varied and nucleation occurs either continuously as a function of time or as site saturated. The degree of stored energy is adjusted to range from heterogeneous nucleation at grain edges and corners to homogeneous nucleation throughout the microstructure. Secondary recrystallization is modelled: (a) where the driving force is provided solely by curvature and (b) where the driving force is provided by the difference in the solid-vapor surface energy between grains of different crystallographic orientation. The role of particles in initiating secondary recrystallization is also addressed. The microstructure and kinetics for the different recrystallization processes are discussed and compared. DOE

ION IMPLANTATION AND LASER ANNEALING
1986 5 p
(Contract DE-AC01-85ER-30078)
(DE86-006220; DOE/ER-30078/T3) Avail: NTIS HC A02/MF A01

Three ion implantation and laser annealing projects have been performed by ORNL through the DOE sponsored Seed Money Program. The research has contributed toward improving the characteristics of wear, hardness, and corrosion resistance of some metals and ceramics, as well as the electrical properties of semiconductors. The work has helped to spawn related research, at ORNL and elsewhere, concerning the relationships between microstructure and materials properties. ORNL research has resulted in major advances in extended life and non-corrosive artificial joints (hip and knee), high performance semiconductors, failure resistant ceramics (with potential energy applications), and

solar cells. The success of the seed money projects was instrumental in the formation of ORNL's Surface Modification and Characterization Facility (SMAC). More than 60 universities and companies have participated in SMAC programs. DOE

FLUX PINNING BY GRAIN BOUNDARIES IN A15 SUPERCONDUCTORS
D. O. Welch, M. Suenaga, C. L. Snead, Jr., and R. D. Hatcher (Queens Coll., Flushing, N. Y.) 1985 4 p Presented at the International Symposium on Flux Pinning and Electromagnetic Properties in Superconductors, Fukuoka, Japan, 11 Nov. 1985 Prepared in cooperation with Queens Coll., Flushing, NY.
(Contract DE-AC02-76CH-00016)
(DE86-006250; BNL-37574; CONF-8511126-3) Avail: NTIS HC A02/MF A01

The form of the scaling law for flux pinning by grain boundaries in A15-structure compounds, primarily in the case of Nb3Sn and its alloys, is discussed, and the effect of alloying and radiation damage on the pinning strength is compared with predictions of the electron-scattering theory of the elementary pinning force. In addition, some preliminary results of 2-dimensional computer simulations are discussed in relation to the observed effects of alloying on the form of the scaling law for Nb3Sn. DOE

(DE86-006260; SAND-85-2633C; CONF-8509175-2) Avail: NTIS HC A02/MF A01

Band structure calculations of metal hydrides have provided understanding of the bonding characteristics of these materials and clarified the mechanisms involved in various physical properties such as superconductivity. This article focuses on the methodology and results of disordered hydrides (TiFeH(sub x), transition-metal dihydrides, Pd-noble metal hydrides). This disorder can occur on the metal site of the hydride by considering random substitutions of the host metal or on the hydrogen sublattice where vacancies appear. The theory used is based on the coherent potential approximation and proceeds as follows. Self-consistent band structure calculations of typical metal hydrides are performed by the augmented plane wave method. Results are fitted to a tight-binding Hamiltonian using a Slater-Koster type of procedure. This Hamiltonian is then used in a tight-binding version of the coherent potential approximation which gives us the electronic densities of states for different metal and hydrogen compositions. DOE

EFFECTS OF 500 keV ELECTRON IRRADIATION AND SUBSEQUENT ANNEALING ON 1/f NOISE IN COPPER FILMS
J. Pelz and J. Clarke Oct. 1985 7 p Presented at the 8th International Conference on Noise in Physical System and 4th International Conference on 1/f Noise, Rome, Italy, 9 Sep. 1985
(Contract DE-AC03-76SF-00098)
(DE86-002954; LBL-20385; CONF-8509249-1) Avail: NTIS HC A02/MF A01

Polycrystalline copper films were maintained at 90K on the cold stage of an electron microscope and irradiated with 500keV electrons to induce defect. With an electron dose of about 5 x 10(20)cm(-2), the spectral density of the noise voltage across the films increased by an order of magnitude while the electrical resistivity increased by at most 10%. The films were annealed at progressively higher temperatures; after each annealing process the 1/f noise and resistivity were remeasured at 90K. Both the 1/f noise and resistivity were reduced, but at the lower annealing temperatures the fractional reduction in the added noise was substantially more than in the added resistivity. These results suggest that a large fraction of the added noise may be generated by a small mobile fraction of the added defects that are more readily annealed than the majority of the defects. After a room temperature annealing process, both the noise and resistivity returned nearly to their initial values. The temperature dependence of the noise after irradiation and partial annealing was consistant with the Dutta-Dimon-Horn thermal activation model. DOE

COMPUTER SIMULATION OF MICROSTRUCTURAL DYNAMICS
G. S. Grest, M. P. Anderson, and D. J. Srolovitz 1985 13 p Presented at the Computer Simulation of Microstructural Evolution Symposium, Toronto, Ontario, 14 Oct. 1985 Prepared in cooperation with Los Alamos National Lab., N. Mex.
(Contract W-7405-eng-36)
(DE86-006045; LA-UR-86-420; CONF-8510273-2) Avail: NTIS HC A02/MF A01

Since many of the physical properties of materials are determined by their microstructure, it is important to be able to predict and control microstructural development. A number of approaches have been taken to study this problem, but they assume that the grains can be described as spherical or hexagonal and that growth occurs in an average environment. We have developed a new technique to bridge the gap between the atomistic interactions and the macroscopic scale by discretizing the continuum system such that the microstructure retains its topological connectedness, yet is amenable to computer simulations. Using this technique, we have studied grain growth in polycrystalline aggregates. The temporal evolution and grain morphology of our model are in excellent agreement with experimental results for metals and ceramics. DOE

ELECTRICAL CHARACTERISTICS AND TESTING CONSIDERATIONS FOR GATE OXIDE SHORTS IN CMOS ICs
C. F. Hawkins and J. M. Soden 1985 13 p Presented at the International Test Conference, Philadelphia, Pa., 19 Nov. 1985 Prepared in cooperation with Sandia National Labs., Albuquerque, N. Mex.
(Contract DE-AC04-76DP-00789)
(DE85-016168; SAND-85-0705C; CONF-851130-1) Avail: NTIS HC A02/MF A01

This paper examines the electrical characteristics and testing considerations of gate oxide shorts. Gate oxide shorts will cause increased IDD and in the majority of cases will degrade logic voltage levels and propagation delay times, but may not affect functionality. Stuck-at and functional models are therefore inadequate for testing gate oxide shorts in CMDS ICs unless they are used in conjunction with IDD measurements. DOE

ROLE OF INTERFACES IN CAVITY FORMATION
M. H. Yoo and H. Trinkaus 10 Oct. 1985 29 p Presented at the ASM Metals Congress/TMS-AIME Fall Meeting, Toronto, Ontario, 13 Oct. 1985
(Contract DE-AC05-84OR-21400)
(DE86-004763; CONF-8510160-14) Avail: NTIS HC A03/MF A01

Nucleation of intergranular and interfacial cavities in two-phase materials during deformation at elevated temperatures is examined using a classical nucleation model under time-dependent vacancy supersaturation. Various potential sites of cavity nucleation in structural alloys are reviewed. A predictive capability for the propensity of cavity nucleation is developed on the basis of the mobilities of dislocations involved in the stress concentration and relaxation process. If the mobility of interfacial dislocations at two-phase interfaces is increased to a level close to that of grain-boundary dislocations, cavity formation in two-phase materials can be generally suppressed. HIGH PRESSURE ELECTRON RESONANCE STUDIES OF ELECTRONIC, MAGNETIC AND STRUCTURAL PHASE TRANSITIONS Final Technical Report, 1 May 1982 - 30 Apr. 1984
Joe H. Fifer and Mark C. Croft Jun. 1985 13 p
(Contract DE-AS05-82ER-12061)
(DE85-016971; DOE/ER-12061/3) Avail: NTIS HC A02/MF A01

The construction and testing of a high pressure (100 kbar) X-band electron resonance probe capable of operating down to 1.5 K has been completed. The probe design differs radically from a conventional EPR cavity system and also from the design of other high pressure EPR systems. The pressure is generated by a gasketed diamond anvil cell. The pressure gasket is a rectangular BeCu plate whose length is one half of the microwave wavelength (3 cm). The gasket thus acts as a resonant antenna to receive and store the microwave energy which is transmitted to the gasket by a waveguide that passes through the center of the pressure cell. The waveguide can be rotated relative to the resonator to allow ortical coupling. The diamond anvils, gasket, and sample are supported at the center of the waveguide on sapphire posts. Force is applied to the cell by a differential screw which permits the pressure to be changed while the diamond cell is at low temperature. Pressure calibration is carried out at low temperature using the pressure induced shift of a ruby fluorescence line. Author

ELASTIC AND INELASTIC SURFACE EFFECTS ON ION PENETRATION AND THE RESULTING SPUTTERING AND BACKSCATTERING
A. M. Hassanein and D. L. Smith 1985 16 p
(DE85-016604; CONF-850813-1) Avail: NTIS HC A02/MF A01

The computer code ITMC (Ion Transport in Materials and Compounds) has been developed to study in detail the transport of charged particles in solid materials and surfaces related phenomena such as sputtered atoms and backscattered ions. The code is based on Monte Carlo methods to follow the path and the damage produced by the charged particles in three dimension as they slow down in target materials. Single-element targets as well as alloys with possible different surface and bulk compositions or with layered structures of different materials can be used. Various models developed to calculate the inelastic energy losses with target electrons can be used in the code. Most known interatomic potentials can also be used to calculate the elastic energy losses. The major advantages of the code are its ability and flexibility to use and compare various models of elastic and inelastic energy losses in any target with different compounds and different surface and bulk compositions. ELECTROCHEMICAL PHOTOCAPACITANCE SPECTROSCOPY OF AMORPHOUS SILICON ALLOY MATERIALS Annual Subcontract Report, 1 Jun. 1984 - 30 Sep. 1985
R. Haak Jan. 1986 41 p
(Contract DE-AC02-83CH-10093)
(DE86-004421; SERI/STR-211-2888) Avail: NTIS HC A03/MF A01

The goal of this work was to develop electrochemical photocapacitance spectroscopy (EPS) as an analytical tool to map the energy-level distributions and concentrations of intrabandgap states of hydrogenated amorphous silicon (a-Si:H) and amorphous silicon alloy thin-film materials. EPS should contribute to improving a-Si materials by identifying film deposition condiditons or approaches to eliminate or reduce the number of such states. The emphasis of this work was on optimizing EPS measurement conditions and determining the quantitative accuracy of EPS for this particular sample type; applying EPS to a-Si:H and alloy samples acquired from various sources; and investigating light-induced effects on intrabandgap state levels. Results show that EPS is indeed a simple, sensitive means of evaluating intrabandgap, i.e., dangling bond states, in both p-i and p-i-n a-Si:H materials/devices and p-i-n a-Si:Ge:H devices. DOE

PROCEEDINGS OF THE SECOND WORKSHOP ON ION MIXING AND SURFACE LAYER ALLOYING
Jan. 1986 219 p Workshop held at Pasadena, Calif., 19 Apr. 1985 Prepared in cooperation with Argonne National Lab., Ill. and California Inst. of Tech., Pasadena
(Contract DE-AC04-76DP-00789)
(DE86-006159; SAND-85-2465; CONF-8504116) Avail: NTIS HC A10/MF A01

The intent was to bring together, in an informal setting, those individuals whose work deals with ion mixing and high dose ion implantation. Primary objectives of the workshop were to discuss the basic physical processes underlying ion mixing, compare the approach of ion mixing to that of high dose ion implantation, assess the areas of greatest practical applications for ion mixing, and identify critical areas on which future investigations should focus. The meeting also afforded an opportunity to evaluate progress in the various areas over the past two years. The workshop was primarily concerned with ion mixing phenomena observed for ion energies of about 50 to 500 keV, because accelerators designed for ion implantation in semiconductors are readily available in this energy range. ANOMALOUS BEHAVIOR DURING THE SOLIDIFICATION OF SILICON IN THE PRESENCE OF IMPURITIES
M. O. Thompson and P. S. Peercy Dec. 1985 13 p Presented at the Materials Research Society Meeting, Boston, Mass., 2 Dec. 1985 Prepared in cooperation with Cornell Univ., Ithaca, N.Y.
(Contract DE-AC04-76DP-00789)
(DE86-007395; SAND-85-1405C; CONF-851217-53) Avail: NTIS HC A02/MF A01

Nanosecond pulsed laser irradiation of silicon results in the melting of the surface with subsequent solidification from a crystalline substrate. In the presence of impurities or alloys, the solidification dynamics are greatly affected by the nature of the impurities. Five classes of materials have been investigated: amorphous Si, mutually soluble alloys, high solubility impurities, low solubility impurities, and compound forming materials. Solidification of each of these classes of materials is discussed. Several anomalous kinetic regimes are observed, including explosive crystallization, surface nucleation of solid, and internal nucleation of melt. These results are interpreted in terms of thermodynamic modifications of the melting temperature in the alloy regions. DOE

STRUCTURE AND ELECTRICAL PROPERTIES OF Au CONTACTS TO GaAs
Z. Liliental-Weber, N. Newman, W. E. Spicer, R. Gronsky, J. Washburn, and E. R. Weber Nov. 1985 10 p Presented at the Materials Research Society Meeting, Boston, Mass., 2 Dec. 1985 Prepared in cooperation with Stanford Univ., Calif.
(Contract DE-AC03-76SF-00098)

(DE86-007499; LBL-20618; CONF-851217-56) Avail: NTIS HC A02/MF A01

The structure and electrical properties of Au contacts to GaAs have been studied by analytical and high-resolution transmission electron microscopy (TEM) combined with electrical characterization and photoemission spectroscopy (PES). The contacts were prepared by in-situ deposition of Au onto ultra-high vacuum cleaved n-GaAs (110) surfaces. The effects of annealing on the electrical, morphological and chemical properties of the Au:GaAs contacts were studied. It was shown that the formation of Schottky contacts is correlated with the change in stoichiometry of the GaAs substrate near the Au/GaAs interface. The change to Ohmic behavior for the samples annealed above Au-Ga eutectic was explained by leakage currents at the periphery of the devices. TEM micrographs of the structures revealed the existence of elongated Au crystallites on the GaAs surface at the periphery of the contacts. These leakage currents were eliminated by removing the current path at the periphery using a mesa-etch. DOE

CRYSTALLINE SURFACTANT DISPERSIONS BY RADIO FREQUENCY ABSORPTION
S. H. Tedder Mar. 1986 26 p
(Contract DE-FC22-83FE-60149)
(DE86-000267; NIPER-103) Avail: NTIS HC A03/MF A01

Recently interest has increased in the use of liquid crystalline surfactant dispersions for enhanced oil recovery. The object of the work described in the report was to develop a method of measuring the electrical properties of colloidal surfactant particles, which control the structure and stability of the surfactant dispersion. A further object was to find how these electrical properties are affected by the method used to mix the components of the dispersion. The results may be useful in solving several practical problems, including the identification of optimally performing liquid crystalline surfactant formulations for oil recovery use. Another possible use is to identify and categorize effects of the method of mixing surfactants on the final product. This information would provide guidelines for field handling of chemical recovery agents. The absorption of radio frequency energy, a process which is mediated by the surface electrical properties of the surfactant particles, was used to measure several electrical parameters of the surfactant mixtures. Two commercial petroleum surfactants were tested by the radio frequency absorption method, and a model of their electrical properties was developed and used to fit the data. The strength of the layer of electric charges surrounding the surfactant particles was found to be related to the stability of the solution. DOE

SELECTIVE LOW-PRESSURE SILICON EPITAXY Final Report, Sep. 1984
Heinz-Juergen Voss and Hans Kuerten Bonn Bundesministerium fuer Forschung und Technologie Dec. 1985 89 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-85-133; ISSN-0340-7608; ESA-86-97436) Avail: NTIS HC A05/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 18.50

Selective epitaxy in the low pressure procedure was investigated. The lateral dielectric insulation of devices is performed by selective low pressure silicon epitaxy. The nucleation of Si on the masking oxide and nitride surface can be prevented by water pretreatment and addition of HCl to the reaction gas. The use of low temperature low pressure epitaxy allows to grow layers with homogeneous thickness within the epitaxial islands as well as among the islands. The formation of facets at the boundary between the masking and the epitaxial layer was studied. Electrical and optical measurements of the crystal quality show that selective epitaxy is suitable for semiconductor devices. ESA

DYNAMICS INSULATION SYSTEMS
W. E. W. Chen, W. A. Hepler, S. W. K. Yuan, and T. H. K. Frederking Oct. 1985 38 p
(Grant NAG2-253)
(NASA-CR-177026; NAS 1.26:177026; UCLA-ENG-8532) Avail: NTIS HC A03/MF A01 CSCL 20M

Advanced dynamic insulation systems were analyzed from a thermodynamic point of view. A particular performance measure is proposed in order to characterize various insulations in a unique manner. This measure is related to a base quantity, the refrigeration power ratio. The latter is the minimum refrigeration power, for a particular dynamic insulation limit, to the actual reliquefaction power associated with cryoliquid boiloff. This ratio serves as reference quantity which is approximately constant for a specific ductless insulation at a chosen normal boiling point. Each real container with support structure, vent tube, and other transverse components requires a larger refrigeration power. The ratio of the actual experimental power to the theoretical value of the support-less system is a suitable measure of the entire insulation performance as far as parasitic heat leakage is concerned. The present characterization is illustrated using simple thermodynamic system examples including experiments with liquid nitrogen. Numerical values are presented and a comparison with liquid helium is given. M.G.

EFFECT OF INTERFACIAL PHENOMENA ON CONTACT LINE HEAT TRANSFER, 1 Annual Report, 1 Oct. 1984 - 30 Sep. 1985
Peter C. Wayner, Jr. 20 Oct. 1985 9 p
(Grant AF-AFOSR-0306-84)
(AD-A166088; AFOSR-86-0084TR) Avail: NTIS HC A02/MF A01 CSCL 20/13

The heat transfer characteristics of the contact line region of an evaporating thin liquid film were studied experimentally and theoretically. The effects of composition and temperature gradients on surface shear were analyzed and the results were successfully compared with previously reported experimental trends. The use of a constant vapor pressure boundary condition allowed the relative effects of surface tension, composition and temperature on fluid flow to be mapped. A small heat transfer cell was designed, built and used on the scanning stage of a scanning microphotometer. The unique use of a microphotometer allows the microscopic detail to be measured. The preliminary results are being analyzed to evaluate the effect of capillarity on the evaporating meniscus in heat pipes. Additional development work on the heat transfer cell is required. Modeling studies are being extended. GRA

A GAUSSIAN WAVE PACKET METHOD FOR STUDYING TIME DEPENDENT QUANTUM MECHANICS IN A CURVE CROSSING SYSTEM: LOW ENERGY MOTION, TUNNELING AND THERMAL DISSIPATION Annual Technical Report
Shin-Ichi Sawada and Horia Metiu Feb. 1986 89 p
(Contract N00014-81-K-0598)
(AD-A166262; TR-7) Avail: NTIS HC A05/MF A01 CSCL 20/10

We explore numerically the behavior of a method of describing the time dependent quantum mechanics of a curve crossing system. The two nuclear wave functions corresponding to the two electronic states are each described by a Gaussian wave packet. The packet describing the incident state mimics the initial wave function, and the other packet is created by the time dependent Schroedinger equation. They are both propagated by using a variational method. The packets interact and we do not assume that they have a small width. Exploratory calculations are made for curve crossing dynamics at low kinetic energy above the barrier of the lowest adiabatic state, for tunneling, for multiple crossings, and for a curve crossing system which is strongly coupled to a harmonic bath whose motion is described by a mean trajectory classical Langevin method. ON EXPERIMENTS TO DETECT POSSIBLE FAILURES OF RELATIVITY THEORY
W. A. Rodrigues, Jr. and J. Tiomno 1985 39 p
(DE86-700613; CBPF-NF-009/85) Avail: NTIS (US Sales Only) HC A03/MF A01

Two recently proposed experiments by Kolen and Torr designed to show failures of Einstein's Special Relativity (SR) are analysed. It is pointed out that these papers contain a number of imprecisions and misconceptions which are cleared out. Also the very spread of misconception about anisotropy of propagation of light in vacuum in Lorentz Aether Theory (LAT) is analysed showing that the anisotropy is only a coordinate effect. Comparison of the correct results in LAT theory, leading to violation of SR, with new theoretical and experimental results of Torr et al is made. Some of these new results are shown to be incorrect and/or inconsistent with both SR and LAT. DOE

UNITED STATES AIR FORCE SUMMER FACULTY RESEARCH PROGRAM MANAGEMENT REPORT, 1985 Annual Report
Rodney C. Darrah and Susan K. Espy Dec. 1985 284 p
(Contract F49620-85-C-0013)
(AD-A166175; AFOSR-86-0138TR) Avail: NTIS HC A13/MF A01 CSCL 14/2

The Graduate Student Summer Support Program (GSSSP) is conducted as part of the Summer Faculty Research Program as the Air Force Office of Scientific Research. The program provides opportunities for research in the physical sciences, engineering, life sciences, business, and administrative sciences. The program has been effective in providing basic research opportunities to the Graduate Students of universities, colleges, and technical institutions throughout the United States. The program is available to Graduate Students enrolled in either Masters Degree or Doctorate Programs. It has proven especially beneficial to the students who are starting their academic research programs. Beginning with the 1982 program, research opportunities were provided for 17 graduate students. The 1982 pilot student program was highly successful and was expanded in 1983 to 53 students; there were 84 graduate students in the 1984 program. This document lists the participants and abstracts of their research completed on this project. GRA

DECISION PROCESSES IN INFLUENCE DIAGRAMS: FORMULATION AND ANALYSIS Ph.D. Thesis
Joseph A. Tatman 1985 165 p
(AD-A166327; AFIT/CI/NR-86-24D) Avail: NTIS
HC A08/MF A01 CSCL 05/1

This thesis addresses the problem of extending influence diagram theory such that decision processes can be effectively modeled within this graphical modeling language. Specifically, the extension allows value function separability and the principle of optimality to be captured in an influence diagram and then used in analysis. To accomplish this, the concept of a subvalue node has been developed. The set of value preserving operations on influence diagrams have been expanded to include operations that exploit the presence of these nodes. Also an algorithm has been developed to solve influence diagrams with subvalue nodes. This work is important from two perspectives. From the decision analysis perspective, it allows a full and simple exploitation of all separability in the value function of a decision problem. Importantly, this means that algorithms can be designed to solve influence diagrams that automatically recognize the opportunity for applying the the principle of optimality. From the decision processes perspective, influence diagrams with subvalue nodes allow efficient formulation and solution of nonstandard decision processes. Also it allows the conditional independence among the variables in the problem to be exploited. This significantly reduces the data storage requirements and computational complexity of solving the problem. Finally, the influence diagram with subvalue nodes enhances the understanding of many of the critical characteristics of various decision processes. GRA

A PROGRAM MANAGER'S GUIDE ON MULTIYEAR PROCUREMENT
Clinton J. Asbury, III Apr. 1986 38 p
(AD-A166463; ACSC-86-0130) Avail: NTIS HC A03/MF A01
CSCL 15/5

Multiyear procurement (MYP) is an acquisition strategy that can stabilize weapon system procurement and reduce program costs through economic production rates. This guide is oriented toward government program managers and other system program office representatives interested in the application of MYP to their program. It explains the concept of MYP, gives a brief history, walks through an example, tracks MYP legislation, and describes the criteria for MYP approval and where it can best be applied. GRA

SMALL BUSINESS INNOVATION RESEARCH. ABSTRACTS OF PHASE 2 AWARDS, 1985
1985 35 p
(DE86-005392; DOE/ER-0209-1) Avail: NTIS HC A03/MF A01

Contained in this booklet are abstracts of the Phase II awards made in 1985 under the Small Business Innovation Research (SBIR) program in the Department of Energy (DOE). This program, now completing its third year, was established in compliance with the Small Business Innovation Development Act of 1982, Public Law 97-219. The DOE received 844 proposals in response to its annual program solicitation, and on July 13, 1984, 106 were selected for Phase I funding. The Phase II SBIR program competition was limited to the 101 of these that subsequently proceeded to Phase I contracts and awards. Proposers desiring to maintain project funding continuity from Phase I to Phase II were invited to submit their proposals to DOE not later than February 15, 1985, approximately 6 weeks before the end of their Phase I contracts. Thirty four Phase II proposals were submitted by that date and 13 were selected for Phase II awards; those projects were then able to continue without funding interruption between Phases I and II. The deadline for the submission of Phase II proposals for proposers not seeking to maintain project funding continuity was May 15, 1985. From the 57 proposals submitted by this date and from the 21 unfunded proposals from the February 15 submissions, 33 were selected for Phase II awards. The 46 Phase projects described herein consists of these 33 projects and the 13 projects that were funded from the February 15 submissions. DOE

THE DoD GATEWAY INFORMATION SYSTEM: PROTOTYPE EXPERIENCE Final Report
Gladys A. Cotter Apr. 1986 9 p
(AD-A166200; DTIC/TR-86/6) Avail: NTIS HC A02/MF A01 CSCL 05/2

The Department of Defense (DoD) Research and Engineering community requires rapid, easy access to scientific and technical information relevant to its mission. This information is contained in a multiplicity of databases maintained within the federal and commercial sectors. The DoD Gateway Information System (DGIS) is being developed to provide this community with a modern tool for accessing these databases and extracting information products from them. DGIS is designed to provide the DoD researcher with a single, user-friendly system front-end that can be used to identify, access, interrogate, and post-process information from numerous databases. The DGIS transforms these database and processing resources into a single entity - a virtual database. The Defense Technical Information Center (DTIC) is responsible for managing the design, development, and implementation of DGIS. A prototype version of DGIS is now undergoing test and evaluation. Eight information services have been selected as targets of the prototype gateway. The utility of DGIS will rest on the early acceptance and wide spread participation of users. The design accommodates, transparent to the user, the complexities of accessing, downloading, merging, and processing information from diverse sources. This paper describes DGIS developments and evaluations to date. GRA

DESIGN OF A DATA STORAGE HIERARCHY DSH-I2: SOFTWARE AND HARDWARE
Michael J. Abraham Mar. 1986 120 p
(Contract N00039-83-C-0463)
(AD-A166287; M010-8603-19; TR-19) Avail: NTIS HC A06/MF A01 CSCL 09/2

Modern organizations are becoming increasingly reliant on the storage and processing of very large data bases in support of their accounting, operational control, and high-level decision-making functions. Contemporary Data Base Management Systems are capable of handling data bases on the order of a trillion bits of data, and can process transactions at rates of up to 100 queries per second. However, it is expected that future high-performance DBM's will be required to provide storage capacities and transaction rates several orders of magnitude greater than those of any current systems. It is not unreasonable to project requirements of a quadrillion bits and one million database accesses per second. This report presents a refined set of control algorithms which take advantage of theoretical properties of INFOPLEX-like storage systems. Section 2 presents an overview of the INFOPLEX design issues and tradeoffs related to performance and reliability, and develops a general strategy for efficient READ/WRITE control and reliable fault handling. Section 3 develops the functional design of D SH-III in more detail, including functional descriptions of the system components and their interfaces. GRA

SCIENTIFIC AND TECHNICAL INFORMATION SEARCH AND SERVICE IN THE RESEARCH AND DEVELOPMENT OF MILITARY PRODUCTS
Xiu C. Wang 28 Mar. 1986 15 p Transl. into ENGLISH from Quingbao Kexue (China), v. 5, no. 3, Jun. 1984 p 65-67
(AD-A166300; FTD-ID(RS)T-0883-85) Avail: NTIS HC A02/MF A01 CSCL 05/2

Combining working experiences, the relation of search and service of technical information and research and development of military products, the necessity of the support of strategic and tactic information, and their relation are clarified. The special features of technical information of military products and the channels to obtain such information are also clarified. These include a flow chart of research and development foreign information, tactical information, searching for information and editing. Several important stages of technical information search and service are discussed in the end of this paper. GRA

THE ROLE OF DATABASES IN KNOWLEDGE-BASED SYSTEMS Interim Report
Mark S. Fox and John McDermott Feb. 1986 29 p
(Contract F49620-82-K-0017)
(AD-A166365; CMU-RI-TR-86-3) Avail: NTIS HC A03/MF A01 CSCL 09/2

This paper explores the requirements for database (DB) techniques in the construction of knowledge-based systems (KBS). While early work in Artificial Intelligence (AI) has focused on techniques such as representation and problem-solving, scant attention was paid to the issues to which database research has focused (e.g., data sharing, query optimization, transaction processing). Our principal premise is that although it has appeared that there was little intersection between the particular focus of each group, there is a significant overlap in needs. The maturing of AI techniques has recently led to their application outside of the laboratory, thus thrusting upon them problems requiring DB solutions. On the other hand, DB needs have expanded to include more expressive data models and more powerful query languages (e.g., supporting inference). To ascertain KBS requirements for DBs, three KBSs are described. Each is analyzed from the perspective of the symbol and knowledge level concepts developed by Newell NEWE81. Limitations inherent in this perspective are identified. A new level, the organization level, is proposed as a means of identifying and dealing with these limitations. Three knowledge-based systems are reviewed: XCON/R1, ISIS, and Callisto. GRA

ARTIFICIAL INTELLIGENCE INDEXING: CREATING KNOW-

LEDGE BASES OF INDEX TERMS ORDERED BY SEMANTIC RELATIONS Final Report, 2 Jun. - 12 Dec. 1985
Jay J. Myers, David Y. Kamemoto, and Arthur F. Griffin Dec. 1985 34 p
(Contract DAAK21-85-C-0031)
(AD-A166768; HDL-CR-85-031-1) Avail: NTIS HC A03/MF A01 CSCL 05/2

This report summarizes an investigation of concepts related to the development of intelligent, automated text indexing. It discusses the construction of knowledge bases of index terms and semantic relations extracted from several different types of full-text documents. Approaches to automating this indexing process are examined, including work related to semantic knowledge representation, knowledge engineering, natural language understanding, and semantic inferencing. This research was conducted using a software package which uses semantic networks both for representing knowledge and for displaying a graphical data base. An approach to language processing is outlined which does not require a large lexicon but instead makes use of high-frequency, low-content words supplemented with knowledge of key verbs and generic and domain-specific seed knowledge. This approach uses word order, prepositions, and word endings to determine parts of speech, to identify index terms, and to infer the semantic relations among objects, modifiers, actions, and attributes. The parameters of the requisite seed knowledge and a framework for representing and making use of verb knowledge are described. This artificial intelligence approach to indexing is contrasted with human indexing performance.

GIS (GEOGRAPHIC INFORMATION SYSTEM)-BASED APPLICATIONS WITH A WORLDWIDE DATABASE
K. Kurtz and T. E. Jorgensen 1985 8 p
(AD-A166825; ETL-R-077) Avail: NTIS HC A02/MF A01 CSCL 05/2

This presentation will deal with difficulties associated with developing GIS-based applications programs capable of being used worldwide, or for a significant portion of the world. Issues discussed will include data format requirements, on- and off-lone storage requirements, coordinate and datum transformation problems, and the need to write software which can be easily used by an operator who may not be an expert in Geographic Information System (GIS) operation or in a particular discipline for which the software is based. Alternate solutions to the problems will be presented, and trade-offs involved in the various solutions, with respect to the issues mentioned above, will be discussed. GRA

TRANSLATION TABLE FOR DOE/OSTI - COSATI BIBLIOGRAPHIC RECORDS TO MARC FORMAT RECORDS
K. Gursky, I. Holtkamp, S. Landenberger, C. Ostrander, C. Nook, M. Shanks, and M. Hall Nov. 1985 65 p Prepared in cooperation with Sandia National Labs., Albuquerque, N. Mex., ORNL, Tenn. and DOE, Oak Ridge, Tenn.
(DE86-006473; DOE/TIC-4639; LA-UR-86-136) Avail: NTIS HC A04/MF A01

This report contains the recommendations of the committee for the conversion of data in OSTI fields to MARC fields. It is intended as a tool for OSTI to use in developing software that would enable DOE libraries to download OSTI records into MARC-based systems. Goal is to transfer as complete a set of data for each record as possible. No attempt was made to incorporate changes in the use of numerical tags that OSTI has made over the years. In addition, there are a few OSTI fields generated for internal OSTI use only, or that cannot be transferred into any MARC field in the Books format; these OSTI fields have been designated as not converted in the table. INTRODUCTION TO THE FASTBUS
D. B. Gustavson Dec. 1985 12 p Presented at the BUSCON Conference, San Jose, Calif., 14 Jan. 1986
(Contract DE-AC03-76SF-00515)
(DE86-005830; SLAC-PUB-3844; CONF-860142-1) Avail: NTIS HC A02/MF A01

The Fastbus is a modular data bus system for data acquisition and data processing. It is a multiprocessor system with multiple bus segments which operate independently but link together for passing data. It operates asynchronously to accommodate very high and very low speed devices over long or short paths, using handshake protocols for reliability. It can also operate synchronously with pipelined handshakes for transfer of data blocks at maximum speed. The goals, history and motivation for the Fastbus are summarized briefly. The structure of the Fastbus system is described in general and some details of its operation are introduced. DOE

This is the ninth Semiannual Technical Progress Report prepared under the Automotive Stirling Engine Development

Program. It covers the twenty-eighth and twenty-ninth quarters of activity after award of the contract. Quarterly Technical Progress Reports related program activities from the first through the thirteenth quarters; thereafter, reporting was changed to a Semiannual format. This report summarizes the study of higher-power kinematic Stirling engines for transportation use, development testing of Mod I Stirling engines, and component development activities. Component development testing included successful conical fuel nozzle testing and functional checkout of Mod II controls and auxiliaries on Mod I engine test beds. Overall program philosophy is outlined and data and test results are presented.

TECHNOLOGY TRANSFER AND ARTIFICIAL INTELLIGENCE
Robert R. Mackie and C. D. Wylie Dec. 1985 147 p
(Contract N62269-83-D-0115)
(AD-A166035; TR-51231-1) Avail: NTIS HC A07/MF A01 CSCL 05/1

The purpose of this study was to identify critical user acceptance issues in applying artificial intelligence (AI) technology (e.g., expert systems) to military decision aids, and to develop a technology transfer plan. The application of new technology does not necessarily yield a good product, and even good products do not necessarily succeed on their own merits. Product development and introduction must consider the perspectives of potential users, especially when use of the innovation can be regarded as optional. The officers generally expressed optimism about the potential value of AI. However, negative beliefs held by many officers need to be considered carefully. A number of general design issues were identified, and several man-machine interface preferences were determined, including the desire for: display of historical data on request; use of probability estimates; embedded training and on-line tutorial; auto mode settings with user override; easy updating; suggestive rather than authoritative output; and brief rather than conversational output. A technology transfer plan based on the findings of this study is presented which stresses communications with potential users, involvement of users in design, design for acceptance, and demonstration.

TRANSFER OF HIGH-TECHNOLOGY TO THE SOVIET UNION. A PREDICAMENT FOR THE US
John E. Holland, Jr. 21 Mar. 1986 29 p
(AD-A166469) Avail: NTIS HC A03/MF A01 CSCL 15/4

Through reading Western open-source literature and by international purchases of U.S. computers and electronics, the Soviets have been able to modernize their military forces. This raises the question, Should U.S. technology be in the public domain and available for exploitation by the Soviet Union? The scope of Soviet information gathering operations raises concerns about the true Russian motivation for detente. Complicating the technology-transfer issue has been the prevailing attitude that parity promotes stability among world powers. As a result of this philosophy, the United States has found itself restrained from acquiring a significant technology advantage over the Soviet Union. The U.S. finds itself in the predicament of both needing a technology edge yet being unable to have a significant one. Thus, ensuring that the Soviets are not able to apply U.S. technology too quickly becomes an important aspect of the technology-transfer solution. Although technology controls are expensive and require the commitment of the American public, they are necessary. Should the Soviets gain technological parity, Then the U.S. would be compelled to match Soviet conventional forces to ensure that Russian expansionism is equally restrained.

AN IN-SITU MEASUREMENT OF PARTICULATES FROM SOLID ROCKET MOTORS FIRED IN SPACE c20
John W. Alred *In* Lunar and Planetary Inst. Trajectory Determinations and Collection of Micrometeoroids on the Space Station 1986 p 43-44 (For primary document see N86-30584 21-88)
Avail: NTIS HC A06/MF A01 CSCL 03B

Current models exist that predict the damage caused by the impact of aluminum oxide exhaust particles as well as their lifetime in useable space. In these models, two necessary inputs are the size and flux of the particles. An experiment, referred to as the Plume Witness Plate, was designed for the Remote Manipulator System of the space shuttle orbiter to measure in-situ the flux

and material effects of a solid rocket motor (SRM) firing in space. Five different types of samples were used to provide a broad range of substances: (1) fused quartz glass (representative of orbiter windows); (2) germanium micrometeroid capture cells; (3) orbiter HRTS tiles from the thermal protection system; (4) Kapton foil; and (5) metallic disks of aluminum, copper, titanium, graphite epoxy, and gold. The analyses of the data show excellent agreement with ground-based SRM firings in terms of particle size distribution and mass distribution. The Particle Impact Damage Integrator computer model used to calculate potential damage of orbiter surfaces by SRM exhaust plumes agrees favorable with the results in terms of particle size and velocity distributions though it may be conservative by as much as 20%. M.G.

A long standing constraint on the study of micrometeorites has centered on difficulties in preparing them for analysis. This is due largely to their small dimensions and consequent practical limitations on sample manipulation. Chondritic micrometeorites provide a good example; although much has been learned about their chemistry and mineralogy almost nothing was known about such basic properties as texture and petrographic associations. The only way to assess such properties is to examine microstructure indigenous to the particles. Unfortunately, almost all micrometeorites, out of necessity, have been crushed and dispersed onto appropriate substances prior to analysis, and most information about texture and petrography was lost. Recently, thin-sections of individual extraterrestrial particles have been prepared using an ultramicrotome equipped with a diamond knife. This procedure has been applied to stratospheric micrometeorites and Solar Max impact debris. In both cases the sections have enabled observation of a variety of internal particle features, including textures, porosity, and petrographic associations. The sectioning procedure is described and analysis results for chondritic micrometeoroids and select particles from Solar Max are presented. M.G.

INTERPLANETARY DUST: THE INTERSTELLAR CONNECTION **c90**
William C. Carey and Robert M. Walker *In* Lunar and Planetary Inst. Trajectory Determinations and Collection of Micrometeoroids on the Space Station 1986 p 47-48 refs (For primary document see N86-30584 21-88)
Avail: NTIS HC A06/MF A01 CSCL 03B

Although not proven, there is the widespread belief that comets consist, at least in part, of interstellar material that was originally present in the solar nebula. Furthermore, there are strong arguments in favor of the view that much of the interplanetary dust complex is derived from comets. The main arguments supporting this view are based on mass balance, analysis of the orbital parameters of meteors, and the long known association between meteor showers and specific comets. Laboratory measurements on interplanetary dust particles (IDPs) collected in the stratosphere have confirmed the view that many of the dust particles are primitive in the sense that they show striking enrichments of D/H relative to average solar system materials. It has also been demonstrated that the mid-infrared absorption spectra of one infrared red class of particles show strong similarities to IR sources such as the protostar W-33A. However, the laboratory studies of IDPs have shown that they represent a diverse set of objects and the measurement of the orbital parameters of specific dust particles is essential to answering the question of sources. The observation of the IRAS dust bands reopens the question of the role of asteroids in supplying a significant fraction of the dust and part of the diversity observed may be due to the fact that some of the dust is asteroidal and some cometary. In addition, some fraction of interplanetary dust must consist of an interstellar component intercepted by the solar system in its motion through the local interstellar medium. It has been shown that dust derived from nearby stars will have 75% of their orbits with eccentricities < or equal to 1.1 and might be difficult to distinguish from interplanetary dust based on orbital measurements alone. M.G.

PROSPECTS FOR AN ORBITAL DETERMINATION AND CAPTURE CELL EXPERIMENT **c90**
William C. Carey and Robert M. Walker *In* Lunar and Planetary Inst. Trajectory Determinations and Collections of Micrometeoroids on the Space Station 1986 p 49-51 refs (For primary document see N86-30584 21-88)
Avail: NTIS HC A06/MF A01 CSCL 03B

A dust experiment which combines measurements of the elemental and isotopic composition of individual particles with orbital information would contribute fundamental, new scientific information on the sources contributing to the micrometeoroid population. The general boundary conditions for such a system are: (1) it must be capable of measuring velocities in the range of 10 km/sec to 100 km/sec with several percent accuracy; (2) it must collect particles in such a way that the debris atoms are locally concentrated so that precise isotopic measurements are possible; (3) it should collect particles over a wide range of sizes starting with a lower limit of 10 microns; (4) it should incorporate materials that will not compromise the isotopic measurements; and (5) it should be large enough to obtain statistically meaningful results within a reasonable exposure time. Techniques which may satisfy these conditions are described. M.G.

THE USE OF TETHERED SATELLITES FOR THE COLLECTION OF COSMIC DUST AND THE SAMPLING OF MAN MADE ORBITAL DEBRIS FAR FROM THE SPACE STATION **c18**
G. J. Corso *In* Lunar and Planetary Inst. Trajectory Determinations and Collection of Micrometeoroids on the Space Station 1986 p 52-53 refs Prepared in cooperation with Loyola Univ., Chicago, Ill. (For primary document see N86-30584 21-88)
Avail: NTIS HC A06/MF A01 CSCL 03B

The use of a tethered subsatellite employed downward into the earth's upper atmosphere to an altitude of about 110 km above the earth would eliminate the orbital contamination problem while at the same time affording a measure of atmospheric braking to reduce the velocities of many particles to where they may be captured intact or nearly so with properly designed collectors. The same technique could also be used to monitor the flux of all types of man-made orbital debris out to a distance of more than a hundred kilometers in any direction from the space station. In this way the build up of any debris belt orbiting earth could be determined. The actual collecting elements used for both purposes could be of several different materials and designs so as to optimize the collection of different types of particles with different densities. Stacks of foils, films, plastics, and foams, as well as simple capture cells would be mounted in clusters around the outside of a tethered satellite and protected by iris covers until the tethered had been fully deployed. If the orientation history of the satellite were known the direction of the incoming material could be infered. A chief advantage in deploying such tethered collectors from the Space Station instead of from the shuttle is the ability to maintain deployment of the tether for days instead of hours resulting in much greater yields of intact particles and impact debris. M.G.

A new class of dust particle detector, the PVDF dust detector, was designed for space missions such as the Halley Comet missions where the particle impact velocity is very high. It is demonstrated that this same PVDF detector (operating in a different mode) also has the capability of detecting dust particles having low velocity (approx. 100 m/s). This low velocity detection capability is extremely important in terms of planned missions requiring measurement of low velocity dust particles such as comet rendezvous missions. An additional detecting element (charge induction cylinder) was also developed which, when combined with a PVDF detector, yields a system which will measure the charge (magnitude and sign) carried by a cometary particle as well as the particle velocity and mass for impact velocities in the range 100 to 500 m/s. Since the cylinder-PVDF detector system has a relatively small geometry factors, an array of PVDF detectors was included having a total sensing area of 0.1 sq m for measurements in regions of space where the dust flux is expected to be low. The characteristics of the detectors in this array have been chosen to provide optimum mass sensitivity for both low-velocity cometary dust as well as high-velocity asteroid associated and interplanetary dust. The study of cosmic dust or interplanetary dust particles (IDP) can provide vital information about primitive materials derived primarily from comets and asteroids along with a small unknown fraction from the nearby interstellar medium. The study of these particles can enhance our understanding of comets along with the decoding of the history of the early solar system. In addition the study of the cosmic dust for IDP particles can assist in the elucidation of the cosmic history of the organogenic elements which are vital to life processes. Studies to date on these particles have shown that they are complex, heterogeneous assemblages of both amorphous and crystalline components. In order to understand the nature of these particles, any analytical measurements must be able to distinguish between the possible sources of these particles. A study was undertaken using a laser microprobe interfaced to a quadrupole mass spectrometer for the analysis of the volatile components present in cosmic dust particles, terrestrial contaminants present in the upper atmosphere, and primitive carbonaceous chondrites. From the study of the volatiles released from the carbonaceous materials it is hoped that one could distinguish between components and sources in the IDP particles analyzed. The technique is briefly described and results for the CI, CM, and CV chondrites and cosmic dust particle W7027B8 are presented. M.G.

Hypervelocity particles colliding with passive capture media will be traversed by shock waves; depending on the stress amplitude, the particle may remain solid or it may melt or vaporize. Any capture mechanism considered for cosmic dust collection in low Earth-orbit must be designed such that sample alteration and hence loss of scientific information is minimized. Capture of pristine particles is fundamentally difficult, because the specific heat of melting and even vaporization is exceeded upon impact at typical, geocentric encounter velocities. From the results of calculated and observed melting behaviors it is concluded that shock stresses in excess of 50 GPA should be avoided during hypervelocity particle capture on board Space Station and that stresses < 20 GPa, even at 15 km/s collision velocities, should constitute desirable instrument design goals. Some principal characteristics of the capture medium that may satisfy these requirements are identified. M.G.

The Two-Stage Acoustic Penetration and Impact Detector is a simple device for measuring the impact event time, the projectile velocity, the flight path direction and the momentum. The results of laboratory tests have shown that this detector can be used in a wide range of projectile size and velocity. According to measurement purposes the size of the detection area, the distance between the front foil and the target plate and the number of microphones as well as the evaluation procedure can easily be adjusted. The target plate area can also be replaced by another foil detector, if two penetration stages are preferred. This active detector is suitable for a variety of applications in meteoroid and space debris exploration. It can also be supplied with capture cell properties for chemical analysis of inside-deposits. Therefore, this measurement principal has been taken into consideration as a possible flight experiment for instance for a later Longer Duration Exposure Facility (LDEF) flight or future space station activities. It is evident from space flights during the last three years that the low Earth orbital (LEO) environment interacts with spacecraft surfaces in significant ways. One manifestation of these interactions is recession of, in particular, organic-polymer-based surfaces presumably due to oxidation by atomic oxygen, the major component of the LEO environment. Three experiments have been conducted on Space Shuttle flights 5, 8 and 41-G to measure reaction rates and the effects of various parameters on reaction rates. Surface recession on these flights indicates reaction efficiencies approximately 3 x 10(-24) cu cm/atoms for unfilled

organic polymers. Of the metals, silver and osmium are very reactive. Effects on spacecraft or experiment surfaces can be evaluated using the derived reaction efficiencies and a definition of the total exposure to atomic oxygen. This exposure is obtained using an ambient density model, solar activity data and spacecraft parameters of altitude, attitude and operational date. Oxygen flux on a given surface is obtained from the ambient density and spacecraft velocity and can then be integrated to provide the total exposure or fluence. Such information can be generated using simple computational programs and can be converted to various formats. Overall, the extent of damage is strongly dependent on the type of surface and total exposure time. Author

STRATOSPHERIC DUST COLLECTIONS: VALUABLE RESOURCES FOR SPACE AND ATMOSPHERIC SCIENTISTS c46

Ian D. R. Mackinnon *In* Lunar and Planetary Inst. Trajectory Determination and Collection of Micrometeoroids on the Space Station 1986 p 68-69 refs (For primary document see N86-30584 21-88)

Avail: NTIS HC A06/MF A01 CSCL 03B

The stratospheric collection at the Johnson Space Center Curatorial Facility offers a unique opportunity to study well-documented, individual particles (or groups of particles) from a wide variety of sources. The nature of the collection and curation process, as well as the timeliness of some sampling periods, ensures that all data obtained from stratospheric particles is a valuable resource for scientists from a wide range of disciplines. A few samples of the uses of these stratospheric dust collections are outlined. An understanding of global parameters at a particular point in time in the stratosphere can be obtained from a study of complete collection surfaces. For example, an accurate assessment of particle concentration over a wide range of sizes was experimentally determined for the stratospheric cloud formed one month after the eruption of El Chichon. Additional studies on the El Chichon cloud over a six-month period showed that volcanic ash settles out of the stratosphere at a rate determined primarily by particle shape and density. Another study during a volcanically quiescent period has shown that total particle number density during the summer of 1981 was approx. 2.7 x 10(-1) cm(-3), for particles > 1 micron diameter. However, > 95% of these particles were < 5 micrometers diameter. With the above classification scheme, an estimate of micrometeorite number density at 20km altitude can also be made. Continuation of these types of studies, for shorter collection periods at regular intervals, can provide important experimental data on the contributions of orbital debris, rocket firings and transient events on the total stratospheric particle budget. TARGETED FLIGHT OPPORTUNITIES WITH LARGE AREA COLLECTORS c46

Ian D. R. Mackinnon *In* Lunar and Planetary Inst. Trajectory Determinations and Collection of Micrometeoroids on the Space Station 1986 p 70-71 refs (For primary document see N86-30584 21-88)

Avail: NTIS HC A06/MF A01 CSCL 03B

A major factor in the stratospheric collection process is the relative density of particles at the collection altitude. With current aircraft-borne collector plate geometries, one potential extraterrestrial particle of about 10 micron diameter is collected approximately every hour. However, a new design for the collector plate, termed the Large Area Collector (LAC), allows a factor of 10 improvement in collection efficiency over current conventional geometry. The implementation of LAC design on future stratospheric collection flights will provide many opportunities for additional data on both terrestrial and extraterrestrial phenomena. With the improvement in collection efficiency, LAC's may provide a suitable number of potential extraterrestrial particles in one short flight of between 4 and 8 hours duration. Alternatively, total collection periods of approximately 40 hours enhance the probability that rare particles can be retrieved from the stratosphere. This latter approach is of great value for the cosmochemist who may wish to perform sophisticated analyses on interplanetary dust greater than a picogram. The former approach, involving short duration flights, may also provide invaluable data on the source of many extraterrestrial particles. The time dependence of particle entry to the collection altitude is an important parameter which may be correlated with specific global events (e.g., meteoroid streams) provided the collection time is known to an accuracy of < 2 hours. Avail: NTIS HC A06/MF A01 CSCL 03B

The physical properties of impact features observed in the Solar Max main electronics box (MEB) thermal blanket generally suggest an origin by hypervelocity impact. The chemistry of micrometeorite material suggests that a wide variety of projectile materials have survived impact with retention of varying degrees of pristinity. Impact features that contain only spacecraft paint particles are on average smaller than impact features caused by micrometeorite impacts. In case both types of materials co-occur, it is believed that the impact feature, generally a penetration hole, was caused by a micrometeorite projectile. The typically smaller paint particles were able to penetrate though the hole in the first layer and deposit in the spray pattern on the second layer. It is suggested that paint particles have arrived with a wide range of velocities relative to the Solar Max satellite. Orbiting paint particles are an important fraction of materials in the near-Earth environment. In general, the data from the Solar Max studies are a good calibration for the design of capture cells to be flown in space and on board Space Station. The data also suggest that development of multiple layer capture cells in which the projectile may retain a large degree of pristinity is a feasible goal. Author

One rationale for the Space Shuttle program which was dramatically realized during the repair of the Solar Maximum Mission (SMM) is the efficiency of in-orbit satellite servicing. An unexpected benefit of this repair mission was the return of parts of the Solar Max satellite which had been exposed for four years to the space environment. Studies conducted on these parts have yielded valuable data on the micrometeorite flux and composition at shuttle altitudes during this time period. The scientific results from studies of the cosmic dust component of the observed particle impacts are not yet complete but it is clear from the preliminary data available that such studies will be a valuable adjunct to the studies of cosmic dust particles collected in the atmosphere. The success of the initial studies of particles collected during repairs of the SMM spacecraft on a surface not specifically designed as a particle collector nor retrieved in a manner intended to minimize or eliminate local contamination raises the possibility that even more interesting results might be obtained if serviceable satellites were initially designed with these objectives in mind. All designs for modern satellites utilize some form of thermal blanket material in order to minimize thermal stresses inside the spacecraft. It is proposed that all future satellites be designed with standardized removeable

sections of thermal blanket material which could be replaced during on-orbit servicing and returned to earth for detailed study. M.G.

Preliminary results of a study whose aim is the characterization of carbon (C) species in microvolumes of materials by means of laser ionization mass spectrometry (LIMS) are presented. The LIMS instrument employs a pulsed UV laser to produce nearly instantaneous vaporization and ionization of materials, followed by acceleration and time-of-flight analysis of the ions produced. LIMS provides a survey technique with nearly simultaneous acquisition of mass spectra covering the entire elemental range. The main limitation of the LIMS technique at present is its limited ability to perform quantitative analysis, due in part to insufficient knowledge of the mechanism of laser-solid interaction. However, considerable effort is now being directed at making LIMS a more quantitative technique. A variety of different C samples, both natural and man made were analyzed to establish the ability of LIMS to differentiate among the various C phases. The results of preliminary analyses performed on meteoritical and interplanetary dust samples are also presented. The C standards selected for the LIMS characterization range from essentially amorphous soot to diamond, which exhibits the highest degree of ordering. M.G.

THE IMPORTANCE OF CAPTURING UNMODIFIED CHONDRITIC POROUS MICROMETEORITES ON THE SPACE STATION c90
Frans J. M. Rietmeijer *In* Lunar and Planetary Inst. Trajectory Determinations and Collection of Micrometeoroids on the Space Station 1986 p 80-82 refs (For primary document see N86-30584 21-88)
Avail: NTIS HC A06/MF A01 CSCL 03B

The survival of interplanetary dust particles (IDP's) during deceleration by the Earth's atmosphere is determined by their entry parameters, velocity, size and mass. These IDP's reach their terminal velocity at about 55 to 95 km altitude before they gradually settle to 18 to 21 km altitude where they are collected by high flying aircraft. Chondritic porous IDP's (also called chondritic porous (CP) aggregates) show properties consistent with an extraterrestrial origin. It is conceivable that CP aggregates may be collected above the Earth's atmosphere using capture devices on a space station or satellite. In order to preserve pristine CP aggregates, i.e., aggregates with minimal perturbation or degradation of its particulate matter, it is necessary to transfer the kinetic energy on impact so that a minimum amount of energy is dissipated into the impacting particle. It is likely that low-temperature minerals (e.g., layer silicates), volatile phases (e.g., sulfides), structural defects (e.g. nuclear tracks) and hydrocarbons in CP aggregates are sensitive to the efficiency of kinetic energy dissipation. M.G.

The Space Station is being defined as a multi-purpose facility with emphasis in the following areas: scientific and technology research laboratory; permanent observatory; spacecraft servicing facility; construction and assembly facility; manufacturing facility; transportation node; and staging base for future space endeavors. The Station complex, in its initial operating capability configuration, includes a continuously habitable manned element, a polar orbiting unmanned platform, and a second unmanned platform co-orbiting with the manned element. All elements are dependent on the Space Transportation System (STS) for initial placement on-orbit and for subsequent logistical services. The manned element will be designed for long duration operations with systems maintainable on-orbit and operationally autonomous from ground control. A major feature of the Station will be its adaptability to evolutionary technology upgrades; and the Space Station, as a system, is to be designed for maximum ease of use by its users. Author

Knowledge of the phase, structure, and crystallography of cosmic particles, as well as their elemental and isotopic compositions, would be very valuable information toward understanding the nature of our solar system. This information can be obtained from the intact capture of large mineral grains of cosmic particles from hypervelocity impacts. Hypervelocity experiments of intact capture in underdense media have indicated realistic potential in this endeaver. The recovery of the thermal blankets and louvers from the Solar Max spacecraft have independently verified this potential in the unintended capture of cosmic materials from hypervelocity impacts. Passive underdense media will permit relatively simple and inexpensive missions to capture cosmic particles intact, either by going to a planetary body or by waiting for the particles to come to the Shuttle or the Space Station. Experiments to explore the potential of using various underdense media for an intact comet sample capture up to 6.7 km/s were performed at NASA Ames Research Center Vertical Gun Range. Explorative hypervelocity experiments up to 7.9 km/s were also made at the Ernst Mach Institute. These experiments have proven that capturing intact particles at hypervelocity impacts is definitely possible. Further research is being conducted to achieve higher capture ratios at even higher hypervelocities for even smaller projectiles. Author

COSMIC DUST DETECTION WITH LARGE SURFACE PIEZOCERAMICS c90
U. Weishaupt *In* Lunar and Planetary Inst. Trajectory Determinations and Collection of Micrometeoroids on the Space Station 1986 p 88-90 (For primary document see N86-30584 21-88)
Avail: NTIS HC A06/MF A01 CSCL 03B

Piezoelectric transducers mounted on targets made out of metal plates or plastic foils have been used in many former space missions to detect impacting dust particles and to determine some of their parameters (e.g., momentum). The proposed detector is based on a large disc made out of piezoceramic material. Dust particles impacting on the detector will cause electrical charge pulses due to the piezoelectric nature of the target material. These charge pulses are measured on the electrodes of the disc and transformed with a charge sensitive amplifier (CSA) to voltage pulses. Counting the number of pulses leads to the dust-flux impacting on the detector. Additionally the amplitude and the rise time of the pulse slopes are determinated to evaluate the momentum and the size of the dust particles. Due to the high charge production rate per force unit of piezoceramics and momentum transfer without loss the sensivity of this acoustic sensor is very high. A method to derive size and momentum from the rising slope of an acoustic signal is described. M.G.

A MICROMETEOROID DECELERATION AND CAPTURE EXPERIMENT: CONCEPTUAL EXPERIMENT DESIGN DESCRIPTION **c90**
J. H. Wolfe (San Jose State Univ., Calif.), R. W. Ballard, G. C. Carle, and T. E. Bunch *In* Lunar and Planetary Inst. Trajectory Determinations and Collection of Micrometeoroids on the Space Station 1986 p 91-93 (For primary document see N86-30584 21-88)
Avail: NTIS HC A06/MF A01 CSCL 03B

The preliminary conceptual design for a cosmic dust collector is described. For the case of low Earth orbit (LEO), dust particles enter the collector through the collimator at a few volts negative potential due to charging in the ionosphere, at a velocity of 1 to 50 km/sec. The particles then pass through an electron stream and are charged to about 1 KV negative (regardless of incoming polarity). The 1 KV negatively charged particle then passes through three sensing grids coupled to charge sensitive preamps (CSP). The comparison of the two pulses provided by S(1) and S(2) are utilized by the microprocessor to determine the charge, q, on the particle (pulse amplitude) and its velocity, v (by time of flight). The third sensing grid, S(3), is kept at about 20 KV negative so that the dust particle will now be decelerated in passing from S(2) (zero potential) to S(3). S(3) is capacitively coupled to its CSP and the pulse from S(3) is utilized by the microprocessor to determine the particle's energy, E, and therefore its mass, m (again by time of flight) by comparison with the pulses from S(1) and S(2). The microprocessor can now precisely program the high-voltage switching network for the proper timing in the grounding of the successive deceleration grids. As determined by the microprocessor, each successive deceleration grid is grounded just after the dust particle passes, thus reducing the particle's energy by the amount q*100 KV at each stage. The microprocessor also determines at which stage the particle will fall below a certain critical energy where all remaining grids remain unswitched so that the particle will drift to the collector. The collector is kept at about 100V positive and is covered with gold foil to eliminate contamination and is removable for subsequent return to earth for detailed analysis. Author

Avail: NTIS HC A06/MF A01 CSCL 03B

The metal oxide semiconductor (MOS) capacitor micrometeoroid detector consists of a thin dielectric capacitor fabricated on a silicon wafer. In operation, the device is charged to a voltage level sufficiently near breakdown that micrometeoroid impacts will cause dielectric deformation or heating and subsequent arc-over at the point of impact. Each detector is capable of recording multiple impacts because of the self-healing characteristics of the device. Support instrumentation requirements consist of a voltage source and pulse counters that monitor the pulse of recharging current following every impact. An investigation has been conducted in which 0.5 to 5 micron diameter carbonized iron spheres traveling at velocities of 4 to 10 Km/sec were impacted on to detectors with either a dielectric thickness of 0.4 or 1.0 micron. This study demonstrated that an ion microprobe tuned to sufficiently high resolution can detect Fe remaining on the detector after the impact. Furthermore, it is also possible to resolve Fe ion images free of mass interferences from Si, for example, giving its spatial distribution after impact. Specifically this technique has shown that significant amounts of impacting particles remain in the crater and near it which can be analyzed for isotopic content. Further testing and calibration could lead to quantitive analysis. This study has shown that the capacitor type micrometeoroid detector is capable of not only time and flux measurements but can also be used for isotopic analysis. M.G.

It has been known for some time that the orbital parameters of certain major meteor streams rather closely match those of presently observed comets. There is therefore a clear parent-daughter orbital relationship between meteoroids in certain streams and the comets that they derived from. For meteoroids in the photographic meteor range, it has been estimated that from 1% to 10% of the meteoroid mass is concentrated into the major streams. However, for the smaller, more numerous meteoroids observed as radar meteors, streams are less intense but there are more of them. Sekanina (1973) has established for the radar meteors that, in addition to comets, some of the parent bodies appear to be asteroids. As noted by Grun et al. (1985), meteoroid lifetimes, due to collisional destruction or Poynting-Robertson (P-R) drag losses, range from 10(5) yr downward to less than 10(3) yr; these meteoroids therefore need to be continuously be replenished by source bodies to maintain the meteoritic complex in some sort of temporal equilibrium. It will be very important to obtain their precise trajectories when meteoroids are collected with a capture apparatus in Earth orbit, as is made apparent with the following logic: a chemical, isotopic, or other analysis of any particular meteoroid constitutes a similarly detailed analysis of a small part of the parent comet or asteroid that is orbitally associated with it. One can, consequently, do rather detailed cometary or asteroid science utilizing only an Earth-orbiting cosmic dust capturing facility. Author

SPACE INFRARED TELESCOPE POINTING CONTROL SYSTEM. AUTOMATED STAR PATTERN RECOGNITION Final Report
J. David Powell and Roel W. H. VanBezooijen Jan. 1985 44 p
(Contract NCC2-2-29)
(NASA-CR-176911; NAS 1.26:176911) Avail: NTIS HC A03/MF A01 CSCL 03A

The Space Infrared Telescope Facility (SIRTF) is a free flying spacecraft carrying a 1 meter class cryogenically cooled infrared telescope nearly three oders of magnitude most sensitive than the current generation of infrared telescopes. Three automatic target acquisition methods will be presented that are based on the use of an imaging star tracker. The methods are distinguished by the number of guidestars that are required per target, the amount of computational capability necessary, and the time required for the complete acquisition process. Each method is described in detail. B.G.

This program was directed towards a better understanding of some of the important factors in the performance of infrared detector arrays at low background conditions appropriate for space astronomy. The arrays were manufactured by Aerojet Electrosystems Corporation, Azusa. Two arrays, both bismuth doped silicon, were investigated: an AMCID 32x32 Engineering mosiac Si:Bi accumulation mode charge injection device detector array and a metal oxide semiconductor/field effect transistor (MOS-FET) switched array of 16x32 pixels. The dynamical, chemical, and thermal evolution of zero-metal gas clouds was modeled to study conditions of star formation in the early universe. Numerical results are given for the collapse of spherical clouds of mass 1000 and 50000 solar mass. Cooling by H2 lines and by photons emitted in H + e(-) yields H(-) = h (sup nu) maintains collapse until formation of an equilibrium protostellar core of mass 0.02 solar mass. The cooling by photons produced with H is essential for low mass star formation. If the cloud is fragmented, the evolution of the pieces is similar to that of the parent cloud, but the equilibrium core has larger density and mass. Author

(NASA-CR-177091; NAS 1.26:177091; IU-86-09) Avail: NTIS HC A02/MF A01 CSCL 03B

The hydrogen coma of Comet Halley has been observed in resonantly scattered solar Lyman-alpha radiation during the period 1-29 January 1986 as the comet approached perihelion. These observations were obtained with the imaging photometer for vacuum-ultraviolet wavelengths on the spacecraft Dynamics Explorer 1. For the initial analysis of observations available in 17 orbits distributed throughout the period, least-squares fits are computed for the observed exponential decrease in brightness with radial distance from the nucleus. Brightness at the nucleus increased from approx. 3 to 17 kR during the observing period. Preliminary analysis yields water production rates of approx. 3.6 x 10 to the 29th power and 1.9 x 10 to the 30th power molecules/sec on 1 and 29 January, respectively. Author

CONSIDERATIONS ABOUT THE APPARENT SUPERLUMINAL EX PANSIONS IN ASTROPHYSICS
E. Recami, A. Castellino (Catania Univ., Italy), G. D. Maccarrone, and M. Rodono 1984 35 p Prepared in cooperation with Catania Univ. (Italy). Ist. di Fisica.
(DE86-701328; UNICAMP-IMECC-RI-278) Avail: NTIS (US Sales Only) HC A03/MF A01

The orthodox models devised to explain the apparent superluminal expansions observed in astrophysics - and here briefly summarized and discussed together with the experimental data - do not seem to be too sucessful, especially when confronted with the most recent observations, suggesting complicated expansion patterns, even with possible accelerations. At this point it may be, therefore, of some interest to explore the possible alternative models in which actual Superluminal motions take place. The ground is prepared starting from a variational principle, introducing the elements of a tachyon mechanics within special relativity, and arguing about the expected behaviour of tachyonic objects when interacting (gravitationally, for instance) among themselves or with ordinary matter. Then the simplest Superluminal models are reviewed and developed, paying particular attention to the observations which they would give rise to. It is concluded that some of them appear to be physically acceptable and are statistically favoured with respect to the orthodox ones. DOE

VOLATILE COMPONENTS AND CONTINENTAL MATERIAL OF PLANETS
K. P. Florenskiy and O. V. Nikolayeva Aug. 1986 33 p Transl. into ENGLISH from Geokhimiya (Moscow, USSR), no. 9, 1984 p 1251-1267 Transl. by Scientific Translation Service, Santa Barbara, Calif.
(Contract NASw-4004)
(NASA-TM-88478; NAS 1.15:88478) Avail: NTIS HC A03/MF A01 CSCL 03B

It is shown that the continental material of the terrestrial planets varies in composition from planet to planet according to the abundances and composition of true volatiles (H_2O, CO_2, etc.) in the outer shells of the planets. The formation of these shells occurs very early in a planet's evolution when the role of endogenous processes is indistinct and continental materials are subject to melting and vaporizing in the absence of an atmosphere. As a result, the chemical properties of continental materials are related not only to fractionation processes but also to meltability and volatility. For planets retaining a certain quantity of true volatile components, the chemical transformation of continental material is characterized by a close interaction between impact melting vaporization and endogeneous geological processes. The relief of the true crater-bottom and the distribution of impactites and allogenic breccias for the Popigay and Kara astroblemes is examined. It is shown that the crater morphology and the distribution of ejecta of fragmented and melted masses has a series of features of symmetry in common with lunar analogs of large astroblemes, formed as a result of an oblique impact, as well as with impact and impact-explosive craters. This leads to the conclusion that both structures were formed as a result of oblique impact of meteoroid bodies; the trajectory projection of the body which formed the Popigay crater had an azimuth of 200 + or - 10 deg., while this azimuth for the Kara crater was 50 + or - 10 deg. (Contract NASw-4005)

(NASA-TM-88423; NAS 1.15:88423) Avail: NTIS HC A02/MF A01 CSCL 03B

An X-ray radiometeric experiment is described along with the results of measurements of the elemental composition of aerosols in Venusian clouds. A preliminary analysis of the data showed that sulfur is present in the range of heights 63 to 47 km with mean content of 5.8 mg/cu m and that chlorine is present in the height range 61 to 52 km with a mean content of 4.1 mg/cu m. The results of measurements in the range 52 to 47 km may come to an agreement if phosphorus is present in the aerosol with a mean concentration of 7.7 mg/cu m. Author

PRELIMINARY RESULTS OF MEASUREMENTS BY AUTOMATED PROBES VEGA 1 AND 2 OR PARTICLE CONCENTRATION IN CLOUDS OF VENUS AT HEIGHTS 47-63 KM

Yu. V. Zhulanov, L. M. Mukhin, and D. F. Nenarokov May 1986 13 p Transl. into ENGLISH from Pisma v AZh (USSR), v. 12, no. 2, 1986 p 123-130 Transl. by Kanner (Leo) Associates, Redwood City, Calif.

(Contract NASw-4005)

(NASA-TM-88424; NAS 1.15:88424) Avail: NTIS HC A02/MF A01 CSCL 03B

Results of the preliminary processing of the Vega 1 and 2 descender data on the cloud layer structure of the Venusian atmosphere are discussed. A photoelectric counter for aerosol particles is described together with its optical and pneumatic circuits and operation algorithm. Vertical profiles of concentrations of particles with a diameter of 0.4 microns agree quantitatively with the Pioneer-Venus and Venera 9 and 10 data. Concentrations of these particles are: in the B layer, up to 190/cu cm; in the C layer, up to 10/cu cm; and in the D layer, up to 130/cu cm. Layers have sharp boundaries with a significant vertical heterogeneity of the aerosol concentration field inside them. Author

FUGACITY AND CONCENTRATION GRADIENTS IN A GRAVITY FIELD

Charles E. May Jul. 1986 39 p

(NASA-TM-88809; E-3157; NAS 1.15:88809) Avail: NTIS HC A03/MF A01 CSCL 03B

Equations are reviewed which show that at equilibrium fugacity and concentration gradients can exist in gravitational fields. At equilibrium, the logarithm of the ratio of the fugacities of a species at two different locations in a gravitational field is proportional to the difference in the heights of the two locations and the molecular weight of the species. An analogous relation holds for the concentration ratios in a multicomponent system. The ratio is calculated for a variety of examples. The kinetics for the general process are derived, and the time required to approach equilibrium is calculated for several systems. The following special topics are discussed: ionic solutions, polymers, multiphase systems, hydrostatic pressure, osmotic pressure, and solubility gradients in a gravity field. Author

PRELIMINARY DEVELOPMENT OF A GLOBAL 3-D MAGNETOHYDRODYNAMIC COMPUTATIONAL MODEL FOR SOLAR WIND-COMETARY AND PLANETARY INTERACTIONS

Stephen S. Stahara May 1986 20 p

(Contract NASw-4011)

(NASA-CR-177090; NAS 1.26:177090; RMA-TR-101) Avail: NTIS HC A02/MF A01 CSCL 03B

This is the final summary report by Resource Management Associates, Inc., of the first year's work under Contract No. NASW-4011 to the National Aeronautics and Space Administration. The work under this initial phase of the contract relates to the preliminary development of a global, 3-D magnetohydrodynamic computational model to quantitatively describe the detailed continuum field and plasma interaction process of the solar wind with cometary and planetary bodies throughout the solar system. The work extends a highly-successful, observationally-verified computational model previously developed by the author, and is appropriate for the global determination of supersonic, super-Alfvenic solar wind flows past planetary obstacles. This report provides a concise description of the problems studied, a summary of all the important research results, and copies of the publications. Author

RADIATING SHOCKS AND CONDENSATIONS IN FLARES

G. H. Fisher 1985 12 p Presented at the NSO/SMM Summer Workshop, Sacramento, Calif., 1 Aug. 1985

(Contract W-7405-eng-48)

(DE86-005620; UCRL-93858; CONF-8508157-1) Avail: NTIS HC A02/MF A01

Rapid energy release (by either thick target (beam) or thermal models of heating) in solar flare loop models usually leads to chromospheric evaporation, the process of heating cool chromospheric material to coronal temperatures, and the resulting increase in hot soft x-ray emitting plasma. The evaporated plasma flows up into the coronal portion of the loop because of the increased

pressure in the evaporated region. However, the pressure increase also leads to a number of interesting phenomena in the flare chromosphere. The sudden pressure increase in the evaporated plasma initiates a downward moving chromospheric condensation, an overdense region which gradually decelerates as it accretes material and propagates into the gravitationally stratified chromosphere. Solutions to an equation of motion for this condensation shows that its motion decays after about one minute of propagation into the chromosphere. When the front of this downflowing region is supersonic relative to the atmosphere ahead of it, a radiating shock will form. If the downflow is rapid enough, the shock strength should be sufficient to excite UV radiation normally associated with the transition region, and furthermore, the radiating shock will be brighter than the transition region. These results lead to a number of observationally testable relationships between the optical and ultraviolet spectra from the condensation and radiating shock. DOE

(MPE-195; ISSN-0178-0719; ESA-86-95407) Avail: NTIS
HC A07/MF A01

Ion charges of energetic solar particles were measured and interpreted in order to study their origin, and to understand processes which lead to the heating and acceleration of ions and which play a role in their transport to the earth. Measurements on ions of C, N, O, Ne, Mg, Si, S, and Fe were performed with the ULEZEQ sensor on the ISEE-3 satellite; energy, charge number, and ion charge were separately and independently determined. In order to investigate the influence of nonequilibrium processes on the formation of ion charges, the effect of a suprathermal tail in the electron distribution as well as a time-dependent ionization in the source region plasma were studied; however, the measurements on N, Si, and S could not be explained. During He3-rich periods the average charges of Si and Fe are significantly higher than in a normal solar flare. This is not the case during He(+)-rich events. ESA

NONLINEAR TEMPORAL MODULATION OF PULSAR RADIO-EMISSION
A. C.-L. Chian 1984 17 p
(DE86-700670; INPE-3272) Avail: NTIS (US Sales Only)
HC A02/MF A01

A nonlinear theory is discussed for self-modulation of pulsar radio pulses. A nonlinear Schroedinger equation is derived for strong electromagnetic waves propagating in an electron-positron plasma. The nonlinearities arising from wave intensity induced relativistic particle mass variation may excite the modulational instability of circularly and linearly polarized pulsar radiation. The resulting wave envelopes can take the form of periodic wave trains or solitons. These nonlinear stationary wave forms may account for the formation of pulsar microstructures. DOE

SUBJECT INDEX

Typical Subject Index Listing

The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7053).

A

ABEL FUNCTION
On the isomorphism between gauge groups before and after renormalization in the presence of Abel subgroups and Higgs fields
[AD-A166276] N86-30435
ABERRATION
The effect of aberrations and apodisation on the performance of coherent imaging systems
[AD-A165886] N86-30494
ABLATION
A comprehensive analysis algorithm for ablation, temperature fields and thermal stresses of the carbon-base nosetips
[AD-A166615] N86-29896
Experimental study of chemical alleviation for improving reentry communication
[AD-A165862] N86-30042
ABSORPTION
Near resonant absorption by atoms in intense fluctuating laser fields
[DE86-008513] N86-30159
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A166273] N86-30526
ABSORPTION CROSS SECTIONS
Scattering and absorption of light due to surface resonances on submicron oblate spheroidal particulates
[DE86-005261] N86-30500
ABSORPTION SPECTRA
Theoretical study of the radiative and kinetic properties of selected metal oxides and air molecules
[AD-A166113] N86-30521
ABSORPTION SPECTROSCOPY
An efficient method for solving quantum Liouville equation: Applications to electronic absorption spectroscopy
[AD-A166260] N86-29935
Electronic spectra of various liquids under shock conditions
[AD-A166510] N86-29936
ABSTRACTS
United States Air Force Summer Faculty Research Program management report, 1985

A collection of Area of Interest (AOI) algorithms
[NASA-CR-176984] N86-30404
On compactness of admissible parameter sets: Convergence and stability in inverse problems for distributed parameter systems
[NASA-CR-178128] N86-30423
State estimation for Cox processes with unknown law: Parametric models
[AD-A166179] N86-30432
Piecewise analytical perturbation series methods for solving linear ordinary differential equations. Part 2: The radial Schroedinger equations
[DE86-700606] N86-30438
A note on the evaluation of the mean value scheme for closed multichain queueing networks
[MEMO-COSOR-84-04] N86-30460

ALIGNMENT
Pointing alignment by orthogonal phase-lock feedback loops
[DE86-006707] N86-30082

ALKENES
Olefin polymers as jet fuel antimist additives N86-30016

ALLOTROPY
Nucleation of allotropic phases during pulsed laser annealing of manganese
[DE86-004584] N86-29973

ALLOYS
A literature review on the influence of small-amplitude cyclic loading on stress-corrosion cracking in alloys
[AD-A166403] N86-29967
Local density theory of heats of formation and short-range order parameters in substitutionally disordered alloys
[DE86-007979] N86-29982
Theory of electronic states in disordered alloy hydrides
[DE86-006260] N86-30539
Role of interfaces in cavity formation
[DE86-004763] N86-30543
Proceedings of the Second Workshop on Ion Mixing and Surface Layer Alloying
[DE86-006159] N86-30547

ALTITUDE SIMULATION
An environmentally-controlled extended-use small animal hypobaric chamber
[AD-A166729] N86-30307

ALUMINUM
Computer simulations of the structure and properties of grain boundary dislocations
[DE86-007005] N86-29977
Measurement of population inversions and gain in carbon fiber plasmas
[DE86-002532] N86-30508

ALUMINUM ALLOYS
Outgassing measurement of the aluminum alloy UHV chamber
[NASA-TM-88433] N86-29962
The development of ALADIN (Aluminum alloy design inventor), an expert system for aluminum alloy design
[AD-A166278] N86-29965
Inhibiting corrosion cracking: Crack tip chemistry and physics
[AD-A166317] N86-29966
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A166466] N86-29968
Solidification dynamics and microstructure of metals in pulsed laser irradiation
[DE86-002169] N86-29972
Microalloyed nickel-3/aluminum, a new medium temperature alloy
[DE86-006227] N86-29975
Cryogenic mechanical properties of Al-Cu-Li-Zr alloy 2090
[DE86-006285] N86-29976
Topics in precipitation and ordering reactions and their related phenomena
[DE86-007483] N86-30549

ALUMINUM COATINGS
Microstructural formation and effects on the performance of platinum modified aluminide coatings
[AD-A166166] N86-29963

ALUMINUM OXIDES
Nondestructive evaluation of metal matrix composites
[AD-A166774] N86-29911

AMINES
Amine-CO2 adducts as aviation fuel gelling agents N86-30020
Elementary reactions of electronically excited molecules 6. Quenching of O2(1 delta g) by amines, furanes, pyrroles, and thiophenes
[MPIS-21/1985] N86-30484

AMMUNITION
Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025
Database assessment of pollution control in the military explosives and propellants production industry
[AD-A165853] N86-30264

AMORPHOUS MATERIALS
Theory of amorphization kinetics in intermetallics
[DE86-004858] N86-29974
Spin-coated amorphous chalcogenide resists spin-coated amorphous chalcogenide glasses
[AD-A166270] N86-29991
Research on high-efficiency, single-junction, monolithic, thin-film amorphous silicon solar cells
[DE86-004420] N86-30258
Light-induced excess conductivity and the role of argon in the deposition of doping-modulated amorphous silicon superlattices
[DE86-005812] N86-30535

ANALOG COMPUTERS
500 MHz CCD serial analog memory
[DE86-901019] N86-30084

ANALOG DATA
Analogue signal conditioning for flight test instrumentation
[AGARD-AG-160-VOL-17] N86-29816
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129
ANALYSIS (MATHEMATICS)
Multigrid method for the equilibrium equations of elasticity using a compact scheme
[NASA-CR-178120] N86-30420
ANGLE OF ATTACK
Influence of the angle of attack and flutter on the lift of a supercritical wing. Comparison between theory and experiment
[ONERA-RT-24/3064-RY-044-R] N86-29786
Flight determination of the aerodynamic stability and control characteristics of the NASA SGS 1-36 sailplane in the conventional and deep stall angles-of-attack of between -5 and 75 degrees
[NASA-CR-176962] N86-29865
Computations and turbulent flow modeling in support of helicopter rotor technology
[NASA-CR-177095] N86-30090
ANGLES (GEOMETRY)
The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways
[AD-A166485] N86-29604
ANGULAR MOMENTUM
Effect of Reynolds Number and Mach Number on flow angularity probe sensitivity
[NASA-TM-87750] N86-29774
ANIMALS
An environmentally-controlled extended-use small animal hypobaric chamber
[AD-A166729] N86-30307
ANISOTROPY
Asymmetrical coupled coplanar-type transmission lines with anisotropic substrates N86-30038
On experiments to detect possible failures of relativity theory
[DE86-700613] N86-30560
ANNEALING
Phase transformations in nickel-aluminum alloys during ion beam mixing
[DE86-007519] N86-29980
Spin-coated amorphous chalcogenide resists spin-coated amorphous chalcogenide glasses
[AD-A166270] N86-29991
Ion implantation and laser annealing
[DE86-006226] N86-30537
ANNUAL VARIATIONS
Impact of CO2 on the climate change in North America during the 20th century
[DE86-006126] N86-30266
ANOMALIES
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] N86-29601
Anomalous US weather patterns accompanying stratospheric sudden warming
[AD-A166371] N86-30290
Grid point surface air temperature data set for the Southern Hemisphere
[DE86-007205] N86-30295
The stability of low-latitude sea-surface temperatures: An evaluation of the CLIMAP reconstruction with emphasis on the positive SST anomalies
[DE85-016190] N86-30300
Selection and medical testing of Mirage 2000 pilots: Report of echocardiography N86-30314
The use of ECG changes caused by acceleration as tolerance predicition factors N86-30316
Sensitivity to color contrasts and the selection of navigator personnel N86-30318
ANTARCTIC REGIONS
Pandora: An eleven-box geochemical model of the world ocean
[DE86-006122] N86-30265
ANTENNA ARRAYS
A comparison of methods for adaptive jamming suppression
[REPT-9-85] N86-30033
A review of phase-only sidelobe nulling investigations at RADC (Rome Air Development Center)
[AD-A166602] N86-30045
Proceedings of the 1985 Antenna Applications Symposium, volume 1
[AD-A166754] N86-30048
Test configuration and procedure for determining the operational status of a phased array antenna
[AD-D012216] N86-30051
Dual scan rate radar
[AD-D012221] N86-30052
ANTENNA COMPONENTS
Electromagnetic fields in 3-D for various cavity antennas and Faraday shields
[DE86-007563] N86-30054
ANTENNA RADIATION PATTERNS
Near-field testing of the 15-meter model of the hoop column antenna. Volume 2: Near- and far-field plots for the LaRC feeds
[NASA-CR-178060] N86-29877
A simple circular-polarized antenna: Circular waveguide horn coated with lossy magnetic material
[NASA-CR-177092] N86-30039
Proceedings of the 1985 Antenna Applications Symposium, volume 1
[AD-A166754] N86-30048
ANTHRACENE
Graph theory in the study of metal cluster bponding topology: Applications to metal clusters having fused polyhedra
[AD-A166623] N86-29937
ANTICHOLINERGICS
Thermoregulation after atropine and pralidoxime administration
[AD-A165868] N86-30304
ANTIFRICTION BEARINGS
Instability in Rotating Machinery
[NASA-CP-2409] N86-30160
Instability analysis procedure for 3-level multi-bearing rotor-foundation systems N86-30162
Why have hydrostatic bearings been avoided as a stabilizing element for rotating machines N86-30165
Experimental verification and practical application of torquewhirl theory of rotordynamic instability N86-30169
Backward whirl in a simple rotor supported on hydrodynamic bearings N86-30172
Whirl and whip: Rotor/bearing stability problems N86-30173
Rotor-to-stator rub vibration in centrifugal compressor N86-30178
Measuring dynamic oil film coefficients of sliding bearing N86-30179
Vertical reactor coolant pump instabilities N86-30182
Identification of bearing and seal dynamic stiffness parameters N86-30184
Remarks on rotor stability (A contribution to discussion during symposium on instability in rotating machinery) N86-30191
Demonstration of various rotor instabilities (exhibit of Bently Rotor Dynamics Research Corporation Laborator rigs at symposium on instability in rotaing machinery) N86-30194
ANTIMISSILE DEFENSE
Anti-satellite weapons, countermeasures, and arms control
[PB86-182953] N86-30031
ANTIMISTING FUELS
Full-Scale Transport Controlled Impact Demonstration Program photographic/video coverage
[DOT/FAA/CT-85/35] N86-29795
Antimisting fuel technology for transport category aircraft N86-30006
AMK full-scale transport aircraft validation phase summary N86-30009
Post Controlled Impact Demonstration (CID) analysis N86-30010
UK work on safety fuels N86-30012
Heat transfer, friction, and rheological characteristics of antimisting kerosene N86-30013
Continuous inline blending of antimisting kerosene N86-30015
Olefin polymers as jet fuel antimist additives N86-30016
AMK: Still viable? N86-30017
Amine-CO2 adducts as aviation fuel gelling agents N86-30020
GTA/BASF antimisting fuel research N86-30021
Antimisting kerosene: Evaluation of improved FM-9 additive
[DOT/FAA/CT-85-4] N86-30024
APERTURES
The effect of aberrations and apodisation on the performance of coherent imaging systems
[AD-A165886] N86-30494
APPLICATIONS PROGRAMS (COMPUTERS)
A vectorized molecule code N86-29929
NASA-VOF2D: a computer program for incompressible flows with free surfaces
[DE86-007195] N86-30116
Reference guide for using IGVIEW, an IGES compatible geometry display, editing, and analysis system
[DE86-007190] N86-30392
APPROACH
The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways
[AD-A166485] N86-29604
APPROXIMATION
An entropy correction method for unsteady full potential flows with strong shocks
[NASA-TM-87769] N86-29777
Some navigation and almanac algorithms
[AD-A165840] N86-29900
Time dependent variational description of one-dimensional inelastic scattering
[DE86-700610] N86-30066
The algorithm RMS-DIIS and an ALGOL program for the B-6800 computer to diagonalize large matrices
[INPE-3878-PRE/931] N86-30372
Approximations of nonlinear systems having outputs
[NASA-CR-176946] N86-30417
ARC DISCHARGES
Charge accumulation and arc discharges on spacecraft materials and components
[AD-A166216] N86-29893
An investigation of discharge structures in the submillimeter band in an MHD generator
[VDF-NT-84-16] N86-30516
ARC WELDING
Submerged arc welding control via arc sensing
[AD-A166320] N86-30207
ARCHITECTURE (COMPUTERS)
Proceedings of the 2nd Workshop on Planning and Sensing for Autonomous Navigation
[DE86-006813] N86-29808
A survey of the state of the art and focused research in range systems, task 2
[NASA-CR-176988] N86-30069
On some equivalent configurations of systolic arrays N86-30070
On realizations of least-squares estimation and Kalman filtering by systolic arrays N86-30072
Robotics applications on an advanced hypercube multiprocessor: initial developments
[DE86-008237] N86-30218
Novel architectures for image processing based on computer simulation and psychophysical studies of human visual cortex
[AD-A166222] N86-30333
Ada (trade name) compiler validation summary report: Intermetrics, inc. I2Ada compiler, version 17.08 for the IBM 370 architecture under UTS 2.3
[AD-A166818] N86-30353
Multiprocessor model with distributed task creation
[DE86-005302] N86-30354
Comparison of the CRAY X-MP-4, Fujitsu VP-200, and Hitachi S-810/20: An Argonne perspective
[DE86-006665] N86-30399
Dataflow architectures
[AD-A166235] N86-30407
Functions within the data communication layers of the ISO Open Systems Interconnection (OSI) model
[INF83/IPS/042] N86-30409
ARGON
Light-induced excess conductivity and the role of argon in the deposition of doping-modulated amorphous silicon superlattices
[DE86-005812] N86-30535
ARIANE LAUNCH VEHICLE
Differences between Hermes, US shuttle highlighted N86-29863
ARMED FORCES (FOREIGN)
Transfer of high-technology to the Soviet Union. A predicament for the US
[AD-A166469] N86-30582
ARRAYS
On some equivalent configurations of systolic arrays N86-30071
Numerical simulation of gain-guided diode laser arrays
[DE86-007833] N86-30157
ARTIFICIAL INTELLIGENCE
Proceedings of the 2nd Workshop on Planning and Sensing for Autonomous Navigation
[DE86-006813] N86-29808
The development of ALADIN (Aluminum alloy design inventor), an expert system for aluminum alloy design
[AD-A166278] N86-29865
A knowledge based software engineering environment testbed N86-30364
Report on the AI trip
[IR-82] N86-30397
Overview of ROME: A reason-Oriented Modeling Environment
[AD-A166259] N86-30411
Application of artificial intelligence techniques to fault diagnosis for printed circuits
[ENST-85E011] N86-30413
The role of databases in knowledge-based systems
[AD-A166365] N86-30573
Artificial intelligence indexing: Creating knowledge bases of index terms ordered by semantic relations
[AD-A166768] N86-30574

Technology transfer and artificial intelligence
[AD-A166035] N86-30581

ARTIFICIAL SATELLITES
Anti-satellite weapons, countermeasures, and arms control
[PB86-162953] N86-30031
Dust collection on serviceable satellites N86-30599

ASSEMBLIES
MECHAN: Dynamic analysis of planar mechanisms
[DE85-018023] N86-30214

ASTRONAUTS
Hungarian space research 1981-1985: Lectures and review articles
[NASA-TM-87992] N86-30580

ASTRONOMICAL SATELLITES
X-ray satellite (Rosat)
[NASA-TM-88481] N86-29889

ASTRONOMY
Development of optimized detector/spectrophotometer technology for low background space astronomy missions
[NASA-CR-177142] N86-30609

ASTROPHYSICS
Astrophysical materials science: Theory
[NASA-CR-177021] N86-30610
Considerations about the apparent superluminal expansions in astrophysics
[DE86-701328] N86-30613
Cosmic X-ray physics
[NASA-CR-177227] N86-30624
A study of (OI) 63.2 and 145.5 micron emission from M17 and SGR A from the Lear jet
[NASA-CR-177015] N86-30625

ASYMPTOTIC METHODS
Counting numbers representable as sums of two squares
[LUT-MR-180] N86-30416

ATMOSPHERIC BOUNDARY LAYER
Sensitivity of refractive index profile models to relative humidity sensor errors
[AD-A166626] N86-30293

ATMOSPHERIC CHEMISTRY
Data collection and analysis for HCl, SO2, and NO2 immission-emission differential absorption lidars
[GKSS-85/E/53] N86-30268
Atmospheric carbon dioxide and the global carbon cycle
[DE86-006222] N86-30280
AFOSR (Air Force Office of Scientific Research) Chemical and Atmospheric Sciences Program review (29th)
[AD-A166285] N86-30289
Theoretical study of the radiative and kinetic properties of selected metal oxides and air molecules
[AD-A166113] N86-30521

ATMOSPHERIC CIRCULATION
Perturbations of the Richardson number field by gravity waves
[NASA-CR-176910] N86-30273
Anomalous US weather patterns accompanying stratospheric sudden warming
[AD-A166371] N86-30290

ATMOSPHERIC COMPOSITION
Direct effects of increasing carbon dioxide on vegetation
[DE86-007397] N86-30267
Internal wave motion
[NASA-CR-178871] N86-30275
Proceedings of the MECA Workshop on The Evoluation of the Martian Atmosphere
[NASA-CR-176899] N86-30614

ATMOSPHERIC CORRECTION
Sensitivity of refractive index profile models to relative humidity sensor errors
[AD-A166626] N86-30293

ATMOSPHERIC EFFECTS
Radar detection ranges, taking into account wave propagation phenomena
[REPT-13-85] N86-30034

ATMOSPHERIC ELECTRICITY
Longitudinal difference in the Sq profiles in the South American region
[INPE-3944-PRE/966] N86-30271

ATMOSPHERIC MODELS
A cumulus parameterization study with special attention to the Arakawa-Schubert scheme
[AD-A166801] N86-30277
Factors leading to the formation of arc cloud complexes
[AD-A166501] N86-30291

ATMOSPHERIC MOISTURE
Sensitivity of refractive index profile models to relative humidity sensor errors
[AD-A166626] N86-30293

ATMOSPHERIC PRESSURE
Internal wave motion
[NASA-CR-178871] N86-30275
Factors leading to the formation of arc cloud complexes
[AD-A166501] N86-30291
An environmentally-controlled extended-use small animal hypobaric chamber
[AD-A166729] N86-30307

ATMOSPHERIC TEMPERATURE
Impact of CO2 on the climate change in North America during the 20th century
[DE86-006126] N86-30266
A study of NO gamma bands in the mesosphere from spacelab 1
[AD-A166852] N86-30279
Anomalous US weather patterns accompanying stratospheric sudden warming
[AD-A166371] N86-30290
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292
Grid point surface air temperature data set for the Southern Hemisphere
[DE86-007205] N86-30295

ATMOSPHERIC TURBULENCE
Some thoughts on the modeling of atmospheric turbulence from the perspective of a non-expert
[DE86-006498] N86-30281

ATOMIC COLLISIONS
Measurement of absolute emission cross sections for extreme ultraviolet (EUV) photons in thermal collisions of metastable helium (2 sup 1 S) with neon and helium
[MPIS-14/1985] N86-30480
Orientation effects and fine structure transitions in differential scattering cross sections
[MPIS-15/1985] N86-30481

ATOMIC EXCITATIONS
Near resonant absorption by atoms in intense fluctuating laser fields
[DE86-008513] N86-30159
On the electron affinity of the oxygen atom
N86-30377
Radial distribution of excited atoms in a plasma column produced by a surface wave
[LP-214] N86-30513

ATOMIC STRUCTURE
Theoretical research program to study transition metal trimers and embedded clusters
[NASA-CR-176948] N86-29960
Computer simulations of the structure and properties of grain boundary dislocations
[DE86-007005] N86-29977
Superconducting electronic film structures
[AD-A166183] N86-30522

ATOMIZING
Role of fuel chemical properties on combustor radiative heat load
[NASA-CR-177096] N86-30023

ATROPHY
A possible role for endogenous glucocorticoids in orchiectomy-induced atrophy of the rat levator ani muscle: Studies with RU38486, a potent and selective antiglucocorticoid
[NASA-CR-177029] N86-30343

ATS 3
Occultation of the ATS-3 satellite by the AVEFRIA barium ion cloud
[DE86-008346] N86-30282

ATTENTION
Division of attention as a function of the number of steps, visual shifts, and memory load
[NASA-TM-88775] N86-30328
Attention tasks and their relation to aging and flight experience
[IZF-1986-4] N86-30337

ATTITUDE CONTROL
Vectored thrust digital flight control for crew escape, volume 1
[AD-A166580] N86-29798

ATTITUDE INDICATORS
Improving the interpretability of an aircraft attitude indicator
[AD-A166329] N86-29817

AUDITORY PERCEPTION
A new version of the helicopter aural detection program, ICHIN
[NASA-TM-87745] N86-30471

AURORAS
The effect of finite Blob size on the current convective instability in the auroral ionosphere
[AD-A166806] N86-30278

AUTOMATIC CONTROL
A self-tuning regulator based on pole placement design for use in satellite attitude control
[INPE-3861-PRE/924] N86-29887
Submerged arc welding control via arc sensing
[AD-A166320] N86-30207
TOFACS (Technical Office Automation and Communication System) software development and enhancements for fiscal year 1983 - fiscal year 1985
[AD-A166563] N86-30352
Sensor driven robot systems testbed
[DE86-005892] N86-30412
The output of linear systems to quasipolynomial inputs
[AD-A166740] N86-30437

AUTOMATIC FLIGHT CONTROL
Development of an algorithm to model an aircraft equipped with a generic CDTI display
[NASA-TM-87732] N86-30349

AUTOMOBILE ENGINES
Combustion in IC engines
[DE86-007846] N86-29947
Automotive Stirling engine development program
[NASA-CR-175045] N86-30579

AUTOMOBILES
West Europe report: Science and technology
[JPRS-WST-86-016] N86-29882

AUTONOMOUS NAVIGATION
Proceedings of the 2nd Workshop on Planning and Sensing for Autonomous Navigation
[DE86-006813] N86-29868

AUTOROTATION
Investigation of hazards of helicopter operations and root causes of helicopter accidents
[FAA/PM-86/28] N86-29796
Optimal landing of a helicopter in autorotation
[NASA-CR-177082] N86-29809

AVALANCHES
Blasting and blast effects in cold regions. Part 1: Air blast
[AD-A166315] N86-30104

AVIONICS
Vectored thrust digital flight control for crew escape, volume 1
[AD-A166580] N86-29798
Vectored thrust digital flight control for crew escape, volume 2
[AD-A166596] N86-29799
Technology research for strapdown inertial experiment and digital flight control and guidance
[NASA-CR-176907] N86-29800
Advanced laser based inertial instrument development
[AD-A166307] N86-30128

B

BABOONS
Effects of 60 Hz electric field on operant and social stress behaviors of nonhuman primates
[DE85-016121] N86-30346
Effects of 60 Hz electric fields on operant and social stress behaviors of nonhuman primates
[DE86-005807] N86-30347

BACILLUS
Bacterial inactivation by means of ionizing radiation
[DE86-901038] N86-30348

BACKGROUND RADIATION
Development of optimized detector/spectrophotometer technology for low background space astronomy missions
[NASA-CR-177142] N86-30609

BACKSCATTERING
Frequency quadrupled Nd-Yag laser for LEGS
[DE86-006133] N86-30152
Laser induced oxidation of heavily doped silicon
[DE86-006212] N86-30153
Elastic and inelastic surface effects on ion penetration and the resulting sputtering and backscattering
[DE85-016604] N86-30545

BALANCE
Whirl and whip: Rotor/bearing stability problems
N86-30173
Rotor instability due to loose rotating part N86-30198

BARIUM ION CLOUDS
Occultation of the ATS-3 satellite by the AVEFRIA barium ion cloud
[DE86-008346] N86-30282

BASE FLOW
Component base flow analysis
[AD-A166283] N86-29781

BASE PRESSURE
Component base flow analysis
[AD-A166283] N86-29781

BASIC (PROGRAMMING LANGUAGE)
MECHAN: Dynamic analysis of planar mechanisms
[DE85-018023] N86-30214

BATHS
Industrial inspection of grain size of precision tubes after heat treatment
[BLL-M-36744-(5828.4)] N86-30222
BAYES THEOREM
Robust empirical bayes analyses of event rates
[AD-A166681] N86-30436
BAYS (TOPOGRAPHIC FEATURES)
Continental shelf processes affecting the oceanography of the South Atlantic Bight
[DE86-008212] N86-30301
BEARING (DIRECTION)
Chemically cross-linked heat-shrinkable polyethylene tubes
[AD-A166745] N86-29997
BEARINGS
Bearing tester data compilation analysis, and reporting and bearing math modeling
[NASA-CR-176909] N86-30205
BEAUFORT SEA (NORTH AMERICA)
Mechanical properties of multi-year sea ice. Phase 2: Test results
[AD-A166333] N86-30253
BEHAVIOR
Multiparameter data acquisition systems for studies of Circadian rhythms
[DE86-004041] N86-30308
Effects of 60 Hz electric field on operant and social stress behaviors of nonhuman primates
[DE85-016121] N86-30346
Effects of 60 Hz electric fields on operant and social stress behaviors of nonhuman primates
[DE86-005807] N86-30347
Tail behavior for the suprema of Gaussian processes with a view towards empirical processes
[AD-A166151] N86-30461
BELGIUM
Treadmill spiroergometry in the selection and screening of high-performance combat aircraft pilots in the Beligan Air Force N86-30325
BENDING
Theoretical investigation of the scattering of the rotation-bending coupling, and study of intensity weakening using an optical model: Calculations for the systems H2-LiF(001) and HD-Ag(111)
[MPIS-16/1985] N86-30483
BENDING MOMENTS
Measurement of rotor system dynamic stiffness by perturbation testing N86-30164
Whirl and whip: Rotor/bearing stability problems N86-30173
Demonstration of various rotor instabilities (exhibit of Bently Rotor Dynamics Research Corporation Laborator rigs at symposium on instability in rotaing machinery) N86-30194
BETATRONS
The REBATRON as a high energy accelerator
[AD-A166624] N86-30487
BIAS
Monolithic low noise amplifier with limiting --- application to Global Positioning System receivers
[AD-D012225] N86-30076
A simple example where the jacknife fails --- maximum likelihood estimates
[IR-256] N86-30452
BIBLIOGRAPHIES
Sonic-boom research: Selected bibliography with annotation
[NASA-TM-87685] N86-30470
Scientific and technical papers presented or published by JSC authors in 1985
[NASA-TM-58273] N86-30568
Translation table for DOE/OSTI - COSATI bibliographic records to MARC format records
[DE86-006473] N86-30576
BIG BANG COSMOLOGY
Evolution of primoridal gas clouds
[NASA-CR-176959] N86-30611
BINARY ALLOYS
Certain rules governing damping of vibrations in two-phase alloys
[BLL-M-36760-(5828.4)] N86-29954
BINARY SYSTEMS (MATERIALS)
Certain rules governing damping of vibrations in two-phase alloys
[BLL-M-36760-(5828.4)] N86-29954
BIOELECTRIC POTENTIAL
An investigation of the use of steady-state evoked potentials for human performance and workload assessment and control
[AD-A166205] N86-30332
BIOLOGICAL EFFECTS
Biological studies of swine exposed to 60-Hz electric fields. Volume 5: Hematology and serum chemistry
[DE86-005362] N86-30344
Biological studies of swine exposed to 60-Hz electric fields. Volume 6: Immunology
[DE86-005363] N86-30345
BIOTECHNOLOGY
Japan report: Science and technology
[JPRS-JST-86-011] N86-30086
BLADE TIPS
An investigation of tip planform influence on the aerodynamic load characteristics of a semi-span, unswept wing and wing-tip
[NASA-CR-177110] N86-29766
Influence and tip clearance measurement in turbomachines N86-29854
Prediction of destabilizing blade tip forces for shrouded and unshrouded turbines N86-30183
BLOCKING
Pressure drop in flashing flow through obstructions
[DE86-007152] N86-30113
BLOOD CIRCULATION
Thermoregulation after atropine and pralidoxime administration
[AD-A165868] N86-30304
BLUNT BODIES
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] N86-29772
Comparisons of CFD flow field solutions with experimental data at Mach 14
[DE86-004915] N86-29784
BODY FLUIDS
Human vascular fluid responses to cold stress are not altered by cold acclimation
[AD-A165869] N86-30305
BONDING
Production of an ion-exchange membrane-catalytic electrode bonded material for electrolytic cells
[NASA-TM-88392] N86-29930
BONE DEMINERALIZATION
The temporal response of bone to unloading
[NASA-TM-89228] N86-30303
BOOMS (EQUIPMENT)
Feasibility study of a discrete bearing/roller drive rotary joint for the space station
[NASA-TM-88800] N86-30206
BOREL SETS
Descriptive complexity of function spaces
[IR-278] N86-30465
BORIDES
Development of accurate estimation methods for calculating heat capacities of refractory materials
[DE86-004242] N86-30559
BOROSILICATE GLASS
Performance of commercial and research grade SiC whiskers in a borosilicate glass matrix
[DE86-007379] N86-29914
BOUNDARIES
A comprehensive analysis algorithm for ablation, temperature fields and thermal stresses of the carbon-base nosetips
[AD-A166615] N86-29896
BOUNDARY INTEGRAL METHOD
The calculation of hydrogen diffusion through metal membranes
[JUEL-2029] N86-29985
BOUNDARY LAYER CONTROL
Stability and control of compressible flows over a surface with concave-conves curvature
[NASA-CR-178143] N86-29775
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] N86-29815
BOUNDARY LAYER EQUATIONS
Calculation of laminar-turbulent boundary layer transition on turbine blades N86-29839
BOUNDARY LAYER FLOW
Improvements in code TUNCOR for calculating wall interference corrections in the transonic regime
[AD-A166766] N86-29783
BOUNDARY LAYER SEPARATION
Preliminary research on post-stall aerodynamics
[AD-A166279] N86-29780
BOUNDARY LAYER STABILITY
Boundary layer stability measurements over a flat plate at mach 3
[AD-A166188] N86-29778
BOUNDARY LAYER TRANSITION
Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-178902] N86-29771
Boundary layer stability measurements over a flat plate at mach 3
[AD-A166188] N86-29778
Effects of wakes on the heat transfer in gas turbine cascades N86-29829
Wake-passing in a turbine rotor cascade N86-29830
Calculation of laminar-turbulent boundary layer transition on turbine blades N86-29839
The boundary layer behaviour of an advanced gas turbine rotor blade under the influence of simulated film cooling N86-29862
BOUNDARY LAYERS
A model for correlating flat plate film cooling effectiveness for rows of round holes N86-29840
BOUNDARY VALUE PROBLEMS
The calculation of hydrogen diffusion through metal membranes
[JUEL-2029] N86-29985
Separated flows near the nose of a body of revolution
[NASA-CR-177107] N86-30091
Transient heat conduction in semi-infinite solids with temperature dependent properties
[AD-A166613] N86-30105
Convenient stability criteria for difference approximations of hyperbolic initial-boundary value problems
[NASA-CR-178134] N86-30422
Analysis of dynamical systems
[AD-A166224] N86-30433
Effect of interfacial phenomena on contact line heat transfer, 1
[AD-A166088] N86-30557
BOW WAVES
Theoretical research program to study chemical reactions in AOTV bow shock tubes
[NASA-CR-176992] N86-30371
BRANCHING (MATHEMATICS)
A codimension two bifurcation with a third order Picard-Fuchs equation
[IR-249] N86-30442
BREATHING APPARATUS
Assisted positive pressure breathing and modified anti-acceleration suit filling tested up to 9 G in a human centrifuge, Karolinska Institute
[FOA-C-50038-H1] N86-30341
BRECCIA
Bilateral symmetry of circular impact structures of astroblemes
[NASA-TM-88480] N86-30616
BREEDER REACTORS
Technical issues and requirements of experiments and facilities for fusion nuclear technology, FINESSE phase 1, volume 2
[DE86-006503] N86-30611
BRIGHTNESS
The hydrogen coma of Comet Halley before perihelion: Preliminary observations with dynamics Explorer 1
[NASA-CR-177091] N86-30612
Radiating shocks and condensations in flares
[DE86-005620] N86-30622
BROADBAND
Adaptive microwave channelization
[AD-D012215] N86-30050
BROADBAND AMPLIFIERS
Wide-band distributed RF coupler
[AD-D012214] N86-30049
BROADCASTING
A satellite broadcast receiving terminal
[ESA-86-97317] N86-30057
China's satellite communications discussed N86-30065
BRONZES
Ferroelectric tungsten bronze crystals for far infrared electro-optic device applications
[AD-A166484] N86-30531
BUFFETING
An investigation of empennage buffeting
[NASA-CR-176973] N86-29864
BUILDINGS
Extreme winds and tornadoes: An overview
[DE86-006162] N86-30294
BUS CONDUCTORS
Fiber optical data link extension for the IEC-625 interface bus
[ESA-86-97532] N86-30506
BUTENES
GTA/BASF antimisting fuel research N86-30021
BUTT JOINTS
Use of acoustic emission in study of defects in butt weld during cooling
[BLL-M-36732-(5828.4)] N86-30221
A simple nonlinear joint model
[NASA-TM-87749] N86-30234

C

C BAND
The Delft University of Technology Scatterometer (DUTSCAT) report --- ESA C-band wind scatterometer
[ESA-86-97550] N86-30059

The ESA C-band wind scatterometer campaign: Preliminary campaign definition
[ESA-86-97552] N86-30060
The ESA C-band wind scatterometer campaign: Data processing
[ESA-86-97555] N86-30061
C-130 AIRCRAFT
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] N86-29806
C-141 AIRCRAFT
Computations and turbulent flow modeling in support of helicopter rotor technology
[NASA-CR-177095] N86-30090
CABLES (ROPES)
Near-field testing of the 15-meter model of the hoop column antenna. Volume 2: Near- and far-field plots for the LaRC feeds
[NASA-CR-178060] N86-29877
CALCIFEROL
Calcium and vitamin D metabolism in submariners: Carbon dioxide, sunlight and absorption considerations
[AD-A166292] N86-30306
CALCIUM METABOLISM
Calcium and vitamin D metabolism in submariners: Carbon dioxide, sunlight and absorption considerations
[AD-A166292] N86-30306
CALCULUS
Preliminary investigation of a calculus of functional differences: Fixed differences
[AD-A165879] N86-30429
CALCULUS OF VARIATIONS
Time dependent variational description of one-dimensional inelastic scattering
[DE86-700610] N86-30055
Considerations about the apparent superluminal expansions in astrophysics
[DE86-701328] N86-30613
CALIBRATING
The Delft University of Technology Scatterometer (DUTSCAT) report --- ESA C-band wind scatterometer
[ESA-86-97550] N86-30059
The ESA C-band wind scatterometer campaign: Data processing
[ESA-86-97555] N86-30061
Internal Side-looking Airborne Radar (SLAR) calibration
[85.68220.002] N86-30062
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129
A 1000 amp ac/dc current source for the calibration of welding systems
[DE86-004924] N86-30211
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] N86-30233
Effects of 60 Hz electric field on operant and social stress behaviors of nonhuman primates
[DE85-016121] N86-30346
CAMERAS
Potentials of large format camera photography
[AD-A166079] N86-30126
CANADA
Canadian forces approach to aircrew medical selection N86-30311
CANONICAL FORMS
A canonical form for nonlinear systems
[NASA-CR-176974] N86-30371
Identification of multivariable systems and representation in canonical and pseudo-canonical form
[ESA-86-97520] N86-30446
CAPACITORS
Capacitor-type micrometeoroid detectors N86-30606
CAPTURE EFFECT
Coulomb dissociation as a source of information on radiative capture processes of astrophysical interest
[KFK-4032] N86-30482
CARBIDES
Mechanism of stress-corrosion cracking of Alloy X-750 in high purity water
[DE86-006361] N86-29969
Microstructure, microchemistry, and microdeformation of Alloy 600 tubing
[DE86-007947] N86-29983
Development of accurate estimation methods for calculating heat capacities of refractory materials
[DE86-004242] N86-30559
CARBON
Studies of metal/carbon surface chemistry, September 1, 1985-November 30, 1985
[DE86-007419] N86-29915
Transport coefficients for carbon, hydrogen, and the organic mixture C2H3
[DE86-008323] N86-29949
Laser microprobe characterization of C species in Interplanetary Dust Particles (IDP) N86-30600
CARBON COMPOUNDS
Cosmic X-ray physics
[NASA-CR-177227] N86-30624
CARBON CYCLE
Atmospheric carbon dioxide and the global carbon cycle
[DE86-006222] N86-30280
CARBON DIOXIDE
Atmospheric carbon dioxide and the global carbon cycle
[DE86-006222] N86-30280
An environmentally-controlled extended-use small animal hypobaric chamber
[AD-A166729] N86-30307
CARBON DIOXIDE CONCENTRATION
Pandora: An eleven-box geochemical model of the world ocean
[DE86-006122] N86-30265
Impact of CO2 on the climate change in North America during the 20th century
[DE86-006126] N86-30266
Direct effects of increasing carbon dioxide on vegetation
[DE86-007397] N86-30267
CARBON DIOXIDE LASERS
NASA Lidar system support and MOPA technology demonstration
[NASA-CR-178144] N86-30136
Investigation of basic characteristics of laser heating in thermoluminescence and of laser-stimulated luminescence
[AD-A166089] N86-30138
Pulsed chemical laser technology development test plan single pulse diagnostic testing
[AD-A166203] N86-30140
Dither-free stabilization of CO2 lasers for far infrared pumping: A photoacoustic approach
[DE86-007078] N86-30154
Measurement of population inversions and gain in carbon fiber plasmas
[DE86-002532] N86-30508
CARBON FIBER REINFORCED PLASTICS
General investigations of composite materials. Adhesive bonding of carbon composites --- carbon fibers
[SNIAS-2647/DCI-PR/85] N86-29919
Influence of the test method and the material stiffness on the low velocity impact damage of carbon-epoxy composites, part 2
[PV-47-166/F-PT-2] N86-29920
Aging of carbon-epoxy composite in humid environments
[PV-42-791/F] N86-29921
Determination of the basic parameters in the micromechanical behavior of composite materials
[ONERA-RT-41/7086-M] N86-29922
Investigation of delamination of a composite bar --- carbon fiber/epoxy
[ONERA-RT-9/3542-RY-044-R] N86-29923
CARBON FIBERS
Material properties of epoxy resins reinforced with carbon fibers, affected by heat radiation
[FOA-C-20597-F9] N86-29917
Measurement of population inversions and gain in carbon fiber plasmas
[DE86-002532] N86-30508
CARBON MONOXIDE
A final report on the extension of the MCSCF/CI method N86-29926
Cluster-model calculation of raman intensity for vibration of CO adsorbed on copper
[AD-A166239] N86-29934
CARBON STEELS
Some tentative ideas on developing our low-alloy and alloy steel
[AD-A166269] N86-29964
CARBON 12
Cross section calculations for subthreshold pion production in peripheral heavy-ion collisions
[NASA-TP-2600] N86-30485
CARDIOVASCULAR SYSTEM
Medical Selection and Physiological Training of Future Fighter Aircrew
[AGARD-CP-396] N86-30309
Cardiovascular standards for selection and retention of high performance pilots in the USAF: Perspectives for the next decade N86-30313
Treadmill spiroergometry in the selection and screening of high-performance combat aircraft pilots in the Beligan Air Force N86-30325
Relationship of cardiopulmonary fitness to flight performance in tactical aviation N86-30326
CARRIER MOBILITY
High intensity solar cells
[DE86-006550] N86-30255
CASCADE FLOW
Rotor instability due to loose rotating part N86-30198
CASTING
Nondestructive evaluation of metal matrix composites
[AD-A166774] N86-29911
Ultra-low density microcellular foams
[DE86-007701] N86-30005
CASTINGS
Non-metallic inclusions in cast low-alloy steel with titanium additions
[BLL-M-36733-(5828.4)] N86-29951
CATALYSTS
Production of an ion-exchange membrane-catalytic electrode bonded material for electrolytic cells
[NASA-TM-88392] N86-29930
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A166273] N86-30526
Imaging of surfaces and defects of crystals
[DE86-008302] N86-30552
CATHODE RAY TUBES
The effect of background luminance and ambient illumination on color discrimination in a CRT display
[AD-A166297] N86-30496
CATHODES
Investigation of alternative MCFC cathode materials at Argonne National Laboratory
[DE86-005576] N86-30081
Studies on radiative collisional and ultraviolet lasers
[AD-A166193] N86-30139
CATHODIC COATINGS
Investigation of alternative MCFC cathode materials at Argonne National Laboratory
[DE86-005576] N86-30081
CATHODOLUMINESCENCE
Preparation and optical properties of GA(x)IN(1-x)P alloys
[NASA-TM-88431] N86-30518
CAUCHY PROBLEM
Two-dimensional flux-corrected transport solver for convectively dominated flows
[DE86-005329] N86-30106
CAVITATION FLOW
Investigations of creep cavitation in type 304 stainless steel
[DE86-007187] N86-29978
UK work on safety fuels N86-30012
CAVEAT: A computer code for fluid dynamics problems with large distortion and internal slip
[DE86-008570] N86-30120
CAVITIES
Role of interfaces in cavity formation
[DE86-004763] N86-30543
CAVITY RESONATORS
Wide-band distributed RF coupler
[AD-D012214] N86-30049
Electromagnetic fields in 3-D for various cavity antennas and Faraday shields
[DE86-007563] N86-30054
Light-weight hydrogen maser
[AD-A165850] N86-30137
Development of a solid state laser of Nd:YLF
[DE86-700770] N86-30147
CCD STAR TRACKER
Space infrared telescope pointing control system. Automated star pattern recognition
[NASA-CR-176911] N86-30608
CELL DIVISION
Effects of simulated weightlessness on meiosis. Fertilization, and early development in mice
[NASA-CR-177106] N86-30342
CELLS (BIOLOGY)
Effects of simulated weightlessness on meiosis. Fertilization, and early development in mice
[NASA-CR-177106] N86-30342
CELLULOSE
Synthesis of model polymers and related structures in support of vinyl monomer grafting studies
[DE86-008204] N86-30006
CENTRIFUGAL COMPRESSORS
Full load shop testing of 18,000-hp gas turbine driven centrifugal compressor for offshore platform service: Evaluation of rotor dynamics performance N86-30161
Rotor-to-stator rub vibration in centrifugal compressor N86-30178
Active magnetic bearings for optimum turbomachinery design N86-30186
CENTRIFUGAL PUMPS
Pump instability phenomena generated by fluid forces N86-30181
CERAMIC BONDING
Strength characterization method for evaluating ceramic-to-metal bonds
[DE86-007526] N86-30225

CERAMIC COATINGS
Shroud segments for unshrouded blade turbines
N86-29835
Compilation of information on commercially available ceramic coatings for high-temperature applications
[DE86-006740] N86-30002
CERAMIC MATRIX COMPOSITES
Carbon-rich ceramic composites from ethynyl aromatic precursors
[NASA-TM-88812] N86-29908
CERAMICS
Ceramic heat exchangers for gas turbines or turbojet engines N86-29858
West Europe report: Science and technology
[JPRS-WST-86-016] N86-29862
Relation between microstructural heterogeneous surface layer and nitrogen pressure during sintering in Si3N4-MI2O3 ceramics
[NASA-TM-88409] N86-29988
Thermochemical modeling of ceramic systems formed by combustion
[DE86-007370] N86-30004
A conductively cooled laser diode array pumped laser
[AD-D012217] N86-30143
Directed synthesis/fabrication and surface modification of IR window materials for the 8-14 micron region
[AD-A166661] N86-30497
CEREBRAL CORTEX
Novel architectures for image processing based on computer simulation and psychophysical studies of human visual cortex
[AD-A166222] N86-30333
CERMETS
Cermet fuels for space power systems
[DE86-005543] N86-30490
CESSNA AIRCRAFT
Safety recommendation
[NTSB-A-86-22] N86-29790
CHALCOGENIDES
Spin-coated amorphous chalcogenide resists
spin-coated amorphous chalcogenide glasses
[AD-A166270] N86-29991
Chalcogenide glasses. Part 2: Optical thickness temperature relation in chalcogenide glass films
[AD-A166589] N86-29995
Chalcogenide glasses. Part 3: Chalcogenide glass-forming systems
[AD-A166592] N86-29996
Directed synthesis/fabrication and surface modification of IR window materials for the 8-14 micron region
[AD-A166661] N86-30497
CHANNEL FLOW
Local and mean heat transfer on the leading and trailing surfaces of a square-sectioned duct rotating in the orthogonal-mode N86-29826
CHANNELS (DATA TRANSMISSION)
Data transmission systems circuits and exchange parameters on the C3 interface in the case of the parallel input-output of discrete information
[AD-A166206] N86-30044
A survey of the state of the art and focused research in range systems, task 2
[NASA-CR-176988] N86-30069
Modeling and equalization of nonlinear bandlimited satellite channels N86-30071
Organization of the channel-switching process in parallel computer systems based on a matrix optical switch
[NASA-TM-88452] N86-30406
Introduction to the Fastbus
[DE86-005830] N86-30578
CHARGE COUPLED DEVICES
500 MHz CCD serial analog memory
[DE86-901019] N86-30084
Evaluation of selected detector arrays for space applications
[NASA-CR-176979] N86-30124
CHARGE DISTRIBUTION
Charge states of energetic solar particles
[MPE-195] N86-30623
CHEBYSHEV APPROXIMATION
Chebyshev sets and continuous position
[IR-245] N86-30484
CHEMICAL ANALYSIS
Process of structure formation of sintered steel Kh6V3M
[BLL-M-36781-(5826.4)] N86-29957
CHEMICAL BONDS
Studies of metal/carbon surface chemistry, September 1, 1985-November 30, 1985
[DE86-007419] N86-29915
On the extension of the MCSCF/CI method
[NASA-CR-176933] N86-29924
The nature of chemisorbed oxygen on Ni(100) and Cu(100) N86-29925
A final report on the extension of the MCSCF/CI method N86-29926
Charging and hybridization in the finite cluster model
N86-29927
On the low-lying states of CuO N86-29928
Graph theory in the study of metal cluster bonding topology: Applications to metal clusters having fused polyhedra
[AD-A166623] N86-29937
Dependence of bond strength of layers on energy state of contact surfaces during cladding of bimetals
[BLL-M-36769-(5826.4)] N86-29955
Chemistry of new silicon containing polymers triply bonded silicon intermediates
[AD-A166085] N86-29990
Small angle neutron scattering study on a polymer blend: Characterization of the deformation behavior
[DE86-006099] N86-30003
CHEMICAL COMPOSITION
The influence of chemical structure on the strength of rubber
[AD-A166355] N86-29993
Effect of interfacial phenomena on contact line heat transfer, 1
[AD-A166088] N86-30557
Laser microprobe study of cosmic dust (IDPs) and potential source materials N86-30591
The importance of capturing unmodified chondritic porous micrometeorites on the space station
N86-30601
Preliminary results of determination of chemical element concentrations in the aerosol of Venus clouds
[NASA-TM-88423] N86-30617
CHEMICAL PROPERTIES
Chemically cross-linked heat-shrinkable polyethylene tubes
[AD-A166745] N86-29997
Role of fuel chemical properties on combustor radiative heat load
[NASA-CR-177096] N86-30023
CHEMICAL REACTIONS
Thermochemical modeling of ceramic systems formed by combustion
[DE86-007370] N86-30004
The influence of negative ions on the incoherent diffusion of electromagnetic waves in the D region of the ionosphere
[AERONOMICA-ACTA-A-302-1985] N86-30269
Theoretical research program to study chemical reactions in AOTV bow shock tubes
[NASA-CR-176992] N86-30373
Integral processing in beyond-Hartree-Fock calculations N86-30374
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A166273] N86-30526
Contributions of electron microscopy to the understanding of reactions on compound semiconductor surfaces
[DE86-005230] N86-30533
CHEMISORPTION
The nature of chemisorbed oxygen on Ni(100) and Cu(100) N86-29925
Charging and hybridization in the finite cluster model
N86-29927
Theoretical studies of chemisorption on copper nickel alloys and surface embrittlement
[DE86-007034] N86-29971
CHIPS (ELECTRONICS)
On-line design rule checker — (V)LSI chips
[ESA-86-97529] N86-30403
CHONDRITES
The importance of capturing unmodified chondritic porous micrometeorites on the space station
N86-30601
CHROMIUM
Spectroscopic, optical and thermo-mechanical properties of GSGG and its laser performance
[DE86-005773] N86-30156
CHROMOSPHERE
Radiating shocks and condensations in flares
[DE86-005820] N86-30622
CHUTES
Task force report on emergency evacuation of transport airplanes. Volume 2: Supporting documentation
[FAA/VS-86/1,2] N86-29797
CIRCADIAN RHYTHMS
Multiparameter data acquisition systems for studies of Circadian rhythms
[DE86-004041] N86-30308
CIRCLES (GEOMETRY)
Some navigation and almanac algorithms
[AD-A165840] N86-29803
CIRCUIT BOARDS
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129
CIRCUITS
Analytical methods for characterization of nonlinear devices and networks, volume 1
[AD-A165837] N86-30040
CIRCULAR CYLINDERS
Convective heat transfer from circular cylinders located within perforated cylindrical shrouds
[NASA-CR-4005] N86-30100
A simple nonlinear joint model
[NASA-TM-87749] N86-30034
CIRCULAR POLARIZATION
A simple circular-polarized antenna: Circular waveguide horn coated with lossy magnetic material
[NASA-CR-177092] N86-30009
Nonlinear theory of the free-electron laser
[DE86-700668] N86-30146
CIVIL AVIATION
Introduction to the recent developments of China's civil aviation
[AD-A166194] N86-29793
West Europe report: Science and technology
[JPRS-WST-86-016] N86-29862
CLEAR AIR TURBULENCE
The physical and empirical basis for a specific clear air turbulence risk index
[NASA-CR-3971] N86-30285
CLEARANCES
Influence and tip clearance measurement in turbomachines N86-29854
CLIMATE
Impact of CO2 on the climate change in North America during the 20th century
[DE86-006126] N86-30286
A cumulus parameterization study with special attention to the Arakawa-Schubert scheme
[AD-A166801] N86-30277
CLIMATOLOGY
Proceedings of the MECA Workshop on The Evolution of the Martian Atmosphere
[NASA-CR-176899] N86-30814
CLINICAL MEDICINE
Canadian forces approach to aircrew medical selection N86-30311
CLOCKS
Advanced laser based inertial instrument development
[AD-A166307] N86-30128
CLOUD COVER
Atmospheric, climatic and environmental research
[NASA-CR-176880] N86-30397
CLOUD PHYSICS
A cumulus parameterization study with special attention to the Arakawa-Schubert scheme
[AD-A166801] N86-30277
AFOSR (Air Force Office of Scientific Research) Chemical and Atmospheric Sciences Program review (29th)
[AD-A166265] N86-30288
Factors leading to the formation of arc cloud complexes
[AD-A166501] N86-30291
CLUMPS
Theoretical research program to study transition metal trimers and embedded clusters
[NASA-CR-176948] N86-29990
CMOS
Electrical characteristics and testing considerations for gate oxide shorts in CMOS ICs
[DE85-016168] N86-30142
COAL GASIFICATION
Studies of metal/carbon surface chemistry, September 1, 1985-November 30, 1985
[DE86-007419] N86-29915
COASTAL CURRENTS
Forecasting current velocity on routine basis — flood control
[PUBL-345] N86-30384
COATINGS
Chalcogenide glasses. Part 2: Optical thickness temperature relation in chalcogenide glass films
[AD-A166589] N86-29995
A conductively cooled laser diode array pumped laser
[AD-D012217] N86-30143
Measurement of population inversions and gain in carbon fiber plasmas
[DE86-002532] N86-30302
Stability of surface nucleation
[NASA-TM-88806] N86-30558
COCKPITS
Technology research for strapdown inertial experiment and digital flight control and guidance
[NASA-CR-176907] N86-29900
Aircrew aspects of United Stated future fighter aircraft N86-30310
Development of an algorithm to model an aircraft equipped with a generic CDTI display
[NASA-TM-87732] N86-30045

CODING
CAVEAT: A computer code for fluid dynamics problems with large distortion and internal slip
[DE86-008570] N86-30120
A digital filter for removing known components from spectroscopic data
[AD-A166880] N86-30385
A notation for the most general form of repetition — computer programming
[INF-84-3] N86-30400
Theoretical study of the radiative and kinetic properties of selected metal oxides and air molecules
[AD-A166113] N86-30521
Elastic and inelastic surface effects on ion penetration and the resulting sputtering and backscattering
[DE85-016604] N86-30545
COEFFICIENTS
Transport coefficients for carbon, hydrogen, and the organic mixture C2H3
[DE86-008323] N86-29949
An improved test for the equality of coefficients of variation
[THE-RC-54335B] N86-30396
Estimation of discontinuous coefficients and boundary parameters for hyperbolic systems
[NASA-CR-178133] N86-30424
COGNITION
The importance of specialized cognitive function in the selection of military pilots
[AD-A165889] N86-30330
COGNITIVE PSYCHOLOGY
Cognitive aspects of command and control
[IZF-1986-2] N86-30336
COLD ACCLIMATIZATION
Human vascular fluid responses to cold stress are not altered by cold acclimation
[AD-A165869] N86-30305
COLLECTION
Rocket exhaust probe
[AD-D012224] N86-30132
A collection of Area of Interest (AOI) algorithms
[NASA-CR-176984] N86-30404
Prospects for an orbital determination and capture cell experiment N86-30586
The use of tethered satellites for the collection of cosmic dust and the sampling of man made orbital debris far from the space station N86-30589
Hypervelocity particle capture: Some considerations regarding suitable target media N86-30592
Stratospheric dust collections: Valuable resources for space and atmospheric scientists N86-30596
Targeted flight opportunities with large area collectors N86-30597
The solar maximum satellite capture cell: Impact features and orbital debris and micrometeoritic projectile materials N86-30598
Dust collection on serviceable satellites N86-30599
The importance of capturing unmodified chondritic porous micrometeorites on the space station N86-30601
Intact capture of hypervelocity particles N86-30603
A micrometeoroid deceleration and capture experiment: Conceptual experiment design description N86-30605
COLLISIONS
Non-LTE atomic physics model for laser fusion and X-ray laser simulation
[DE86-006487] N86-30145
COLOR
Sensitivity to color contrasts and the selection of navigator personnel N86-30318
COLOR CODING
The effects of color-coding in GEOSITI (geographical situational) displays. 2: Redundant versus non-redundant color-coding
[AD-A166263] N86-30334
The effect of background luminance and ambient illumination on color discrimination in a CRT display
[AD-A166297] N86-30496
COMBAT
The use of ECG changes caused by acceleration as tolerance prediction factors N86-30316
Visual capabilities related to fighter aircrew performance in the F-14 and adversary aircraft N86-30320
Vision test battery threshold and response time as predictors of air-to-air visual target acquisition in F-14 and adversary aircraft N86-30321
COMBINATORIAL ANALYSIS
The Steiner tree problem. Linear programming model and decomposition technique resolution
[ENST-85E010] N86-30394
COMBUSTIBLE FLOW
Radiative augmented combustion
[AD-A166185] N86-29932
Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025
COMBUSTION
Simultaneous combustion synthesis and densification of refractory materials
[DE86-006528] N86-29939
Combustion synthesis of Si3N4 and AlN
[DE86-006530] N86-29940
Hydrogen-combustion analyses of large-scale tests
[DE86-004722] N86-29944
Thermochemical modeling of ceramic systems formed by combustion
[DE86-007370] N86-30004
Laser ignition studies
[DE86-006043] N86-30151
COMBUSTION CHAMBERS
National Transportation Safety Board safety recommendation
[NTSB-4360/33] N86-29791
Computation of thermal radiation for gas turbine conditions N86-29841
Heat transfer in gas turbine combustors: A discussion of mathematical modeling of combustion, heat and mass transfer with emphasis on heat transfer in gas turbine combustors N86-29843
Effectiveness measurements for a cooling film disrupted by a single jet with wall plunging N86-29844
Alternate cooling configurations for gas turbine combustion systems N86-29845
Full coverage impingement heat transfer: The variation in pitch to diameter ratio at a constant gapp N86-29846
Cooling techniques for turbojet pre-heater channels N86-29847
Modeling of chemical kinetics in pulse combustors
[DE86-001571] N86-29938
Role of fuel chemical properties on combustor radiative heat load
[NASA-CR-177096] N86-30023
COMBUSTION CHEMISTRY
Heat transfer in gas turbine combustors: A discussion of mathematical modeling of combustion, heat and mass transfer with emphasis on heat transfer in gas turbine combustors N86-29843
ECUT pulse combustion research program: A milestone report
[DE86-007747] N86-29946
COMBUSTION PHYSICS
ECUT pulse combustion research program: A milestone report
[DE86-007747] N86-29946
COMBUSTION PRODUCTS
Atmospheric carbon dioxide and the global carbon cycle
[DE86-006222] N86-30260
COMET HEADS
The hydrogen coma of Comet Halley before perihelion: Preliminary observations with dynamics Explorer 1
[NASA-CR-177091] N86-30612
COMETS
A new instrument to measure charged and neutral cometary dust particles at low and high impact velocities N86-30590
Preliminary development of a global 3-D magnetohydrodynamic computational model for solar wind-cometary and planetary interactions
[NASA-CR-177090] N86-30621
COMMAND AND CONTROL
Cognitive aspects of command and control
[IZF-1986-2] N86-30336
COMMERCE
Small Business Innovation Research. Abstracts of Phase 2 awards, 1985
[DE86-005392] N86-30567
COMMERCIAL AIRCRAFT
Introduction to the recent developments of China's civil aviation
[AD-A166194] N86-29763
COMMUNICATION NETWORKS
Round robin scheduling for fair flow control in data communication networks
[AD-A166728] N86-30047
Worldwide report: Telecommunications policy, research and development
[JPRS-TTP-86-011] N86-30064
China's satellite communications discussed N86-30065
Development of China's fiber optic technology discussed N86-30066
COMMUNICATION SATELLITES
Worldwide report: Telecommunications policy, research, and development
[JPRS-TTP-86-013] N86-29897
Satellites said to function well, plans revealed N86-29898
Worldwide report: Telecommunications policy, research and development
[JPRS-TTP-86-011] N86-30064
China's satellite communications discussed N86-30065
COMPARISON
Comparison of the CRAY X-MP-4, Fujitsu VP-200, and Hitachi S-810/20: An Argonne perspective
[DE86-006665] N86-30389
COMPATIBILITY
Antimisting fuel technology for transport category aircraft N86-30008
COMPENSATORS
The design of multirate digital control systems
[NASA-CR-177126] N86-29863
COMPILERS
Ada (trade name) compiler validation summary report: SofTech, Inc. AdaVAX compiler version 2.47, VAX8600, VAX-11/780, VAX-11/785; and MicroVAX 2 using VAX/VMS version 4.1 and MicroVMS 4.1M
[AD-A166213] N86-30350
Ada (trade name) compiler validation summary report: Digital Equipment Corporation VAX Ada compiler version 1.1 VAX 8600, VAX-11/785, VAX-11/780, VAX-11/782, VAX-11/750, VAX-11/730, MicroVAX 1 and 2 VAXstation 1 and 2 using VAX/VMS and MicroVMS version 4.2 and VAXELN version 2
[AD-A166354] N86-30351
Ada (trade name) compiler validation summary report: Intermetrics, inc. I2Ada compiler, version 17.08 for the IBM 370 architecture under UTS 2.3
[AD-A166818] N86-30353
COMPLEX SYSTEMS
Asymptotic methods for the analysis, estimation and control of stochastic dynamic systems
[AD-A166234] N86-30434
COMPONENT RELIABILITY
Oxidizer heat exchanger component testing
[NASA-CR-179487] N86-29901
COMPOSITE MATERIALS
Tension strength of a thick graphite/epoxy laminate after impact by a 1/2-in. radius impactor
[NASA-TM-87771] N86-29907
A brief assessment of structural composite materials research in universities in the United States
[AD-A166665] N86-29910
A viscoelastic-damage simulation model for filament-wound pressure vessels
[AD-A166389] N86-30208
Composite turbine blade design options for Claude (open) cycle OTEC power systems
[DE85-016876] N86-30215
COMPOSITION (PROPERTY)
Ferroelectric tungsten bronze crystals for far infrared electro-optic device applications
[AD-A166484] N86-30531
COMPRESSIBILITY
Mechanical properties of multi-year sea ice. Phase 2: Test results
[AD-A166333] N86-30299
COMPRESSIBLE BOUNDARY LAYER
Component base flow analysis
[AD-A166283] N86-29781
COMPRESSIBLE FLOW
Stability and control of compressible flows over a surface with concave-convex curvature
[NASA-CR-178143] N86-29775
Pseudo-time algorithms for the Navier-Stokes equations
[NASA-CR-178127] N86-29776
Incipient transition phenomena in compressible flows over a flat plate
[NASA-CR-178111] N86-30097
Lyapunov stability of ideal compressible and incompressible fluid equilibria in three dimensions
[DE86-003648] N86-30107
CAVEAT: A computer code for fluid dynamics problems with large distortion and internal slip
[DE86-008570] N86-30120
COMPRESSING
Electronic spectra of various liquids under shock conditions
[AD-A166510] N86-29936
COMPRESSION TESTS
Influence of the test method and the material stiffness on the low velocity impact damage of carbon-epoxy composites, part 2
[PV-47-166/F-PT-2] N86-29920
Mechanical properties of multi-year sea ice. Phase 2: Test results
[AD-A166333] N86-30299

COMPRESSOR ROTORS
Transient thermal behaviour of a compressor rotor with ventilation: Test results under simulated engine conditions N86-29856
Full load shop testing of 18,000-hp gas turbine driven centrifugal compressor for offshore platform service: Evaluation of rotor dynamics performance N86-30161
COMPRESSORS
National Transportation Safety Board safety recommendation
[NTSB-4360/33] N86-29791
Background review on compressors for gas engine-driven heat pumps
[PB86-201175] N86-30220
COMPTON EFFECT
Electron-ion recombination in air at EMP fields
[AD-A166211] N86-30486
COMPUTATION
Some navigation and almanac algorithms
[AD-A165840] N86-29803
Transient heat conduction in semi-infinite solids with temperature dependent properties
[AD-A166613] N86-30105
Computation of dense spray jets
[DE86-008176] N86-30118
Theoretical research program to study chemical reactions in AOTV bow shock tubes
[NASA-CR-176992] N86-30373
Integral processing in beyond-Hartree-Fock calculations N86-30374
A digital filter for removing known components from spectroscopic data
[AD-A166680] N86-30385
Energy Sciences Advanced Computation program plan
[DE86-006958] N86-30391
Shared memory, cache, and frontwidth considerations in multifrontal algorithm development
[DE86-007245] N86-30393
COMPUTATIONAL CHEMISTRY
On the extension of the MCSCF/CI method
[NASA-CR-176933] N86-29924
A final report on the extension of the MCSCF/CI method N86-29926
Charging and hybridization in the finite cluster model N86-29927
On the low-lying states of CuO N86-29928
A vectorized molecule code N86-29929
Graph theory in the study of metal cluster bonding topology: Applications to metal clusters having fused polyhedra
[AD-A166623] N86-29937
Theoretical research program to study chemical reactions in AOTV bow shock tubes
[NASA-CR-176992] N86-30373
Integral processing in beyond-Hartree-Fock calculations N86-30374
Benchmark full configuration-interaction calculations on H2O, F- and F N86-30375
Benchmark full configuration-interaction calculations on HF and NH2 N86-30376
On the electron affinity of the oxygen atom N86-30377
COMPUTATIONAL FLUID DYNAMICS
Calculations of axisymmetric vortex sheet roll-up using a panel and a filament model
[NASA-CR-177081] N86-29767
Analytical investigation of rotor wake formation and geometry
[NASA-CR-177032] N86-29768
Vortex sheet modeling with higher order curved panels
[NASA-CR-176971] N86-29770
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] N86-29772
Experimental and theoretical study of propeller spinner/shank interference
[NASA-CR-176954] N86-29773
Comparisons of CFD flow field solutions with experimental data at Mach 14
[DE86-004915] N86-29784
Flap-lag-torsional dynamics of helicopter rotor blades in forward flight
[NASA-CR-176976] N86-29810
Calculation of laminar-turbulent boundary layer transition on turbine blades N86-29839
Separated flows near the nose of a body of revolution
[NASA-CR-177107] N86-30091
Numerical simulation of the flowfield over ice accretion shapes
[NASA-CR-176960] N86-30093
Incipient transition phenomena in compressible flows over a flat plate
[NASA-CR-178111] N86-30097
On the advantages of the vorticity-velocity formulation of the equations of fluid dynamics
[NASA-CR-178125] N86-30101
Evidence of nonuniqueness and oscillatory solutions in computational fluid mechanics
[DE86-006493] N86-30111
NASA-VOF2D: a computer program for incompressible flows with free surfaces
[DE86-007195] N86-30116
Remote access for NAS: Supercomputing in a university environment
[NASA-CR-177020] N86-30370
COMPUTATIONAL GRIDS
Grid point surface air temperature data set for the Southern Hemisphere
[DE86-007205] N86-30295
Multigrid method for the equilibrium equations of elasticity using a compact scheme
[NASA-CR-178120] N86-30420
COMPUTER AIDED DESIGN
The development of ALADIN (Aluminum alloy design inventor), an expert system for aluminum alloy design
[AD-A166278] N86-29965
Macromodeling and optimization of digital MOS VLSI circuits
[AD-A166658] N86-30075
The Mellin transform filter: A computer generated hologram
[AD-A166191] N86-30127
The computer-aided analytic process model. Operations handbook for the analytic process model demonstration package
[AD-A166180] N86-30381
Proceedings of the 4th DOE Workshop on Computer Aided Engineering
[DE86-006129] N86-30386
Intelligent N/C controllers
[DE86-003132] N86-30387
On-line design rule checker --- (V)LSI chips
[ESA-86-97529] N86-30403
COMPUTER AIDED MANUFACTURING
Intelligent N/C controllers
[DE86-003132] N86-30387
Robotic simulation
[DE86-006517] N86-30390
COMPUTER GRAPHICS
MECHAN: Dynamic analysis of planar mechanisms
[DE85-018023] N86-30214
The effects of color-coding in GEOSIT (geographical situational) displays. 2: Redundant versus non-redundant color-coding
[AD-A166263] N86-30334
Remote access for NAS: Supercomputing in a university environment
[NASA-CR-177020] N86-30370
A browser for directed graphs
[AD-A166622] N86-30383
Compositing DISSPLA output with synthetic images ISSCO week 86
[DE86-004555] N86-30388
Reference guide for using IGVIEW, an IGES compatible geometry display, editing, and analysis system
[DE86-007190] N86-30392
Decision processes in influence diagrams: Formulation and analysis
[AD-A166327] N86-30565
COMPUTER NETWORKS
On some equivalent configurations of systolic arrays N86-30070
Remote access for NAS: Supercomputing in a university environment
[NASA-CR-177020] N86-30370
Optimization of an interactive distributive computer network
[NASA-CR-177373] N86-30405
Protection and resource control in distributed operating systems
[IR-79] N86-30408
Functions within the data communication layers of the ISO Open Systems Interconnection (OSI) model
[INF83/IPS/042] N86-30409
A formal description technique and the ISO transport layer --- Open Systems Interconnection
[INF83/IPS/007] N86-30410
COMPUTER PROGRAMMING
An experimental evaluation of error seeding as a program validation technique N86-30362
Remote access for NAS: Supercomputing in a university environment
[NASA-CR-177020] N86-30370
Dynamic remapping of parallel computations with varying resource demands
[NASA-CR-178150] N86-30379
The status of verification technology for the Ada (Trademark) language
[AD-A166664] N86-30384
A notation for the most general form of repetition --- computer programming
[INF-84-3] N86-30400
Exception handling constructs considered unnecessary --- computer programming
[INF-84-8] N86-30401
COMPUTER PROGRAMS
Analytical investigation of rotor wake formation and geometry
[NASA-CR-177032] N86-29768
Component base flow analysis
[AD-A166283] N86-29781
Some navigation and almanac algorithms
[AD-A165840] N86-29803
Determination of relative sensitivity factors for use in spark-source mass spectrometry

Computer simulation of microstructural dynamics
[DE86-006045] N86-30541
Decision processes in influence diagrams: Formulation and analysis
[AD-A166327] N86-30565

COMPUTERS
Japan report: Science and technology
[JPRS-JST-86-011] N86-30086
The Mellin transform filter: A computer generated hologram
[AD-A166191] N86-30127

CONCATENATED CODES
Coding for reliable satellite communications
[NASA-CR-177262] N86-30035

CONCENTRATION (COMPOSITION)
Fugacity and concentration gradients in a gravity field
[NASA-TM-88809] N86-30620

CONCURRENT PROCESSING
Shared memory, cache, and frontwidth considerations in multifrontal algorithm development
[DE86-007245] N86-30393

CONDITIONING (LEARNING)
Effects of 60 Hz electric fields on operant and social stress behaviors of nonhuman primates
[DE86-005807] N86-30347

CONDUCTIVE HEAT TRANSFER
Prediction of transient temperatures for an air-cooled rotating disc N86-29842
Transient heat conduction in semi-infinite solids with temperature dependent properties
[AD-A166613] N86-30105
A conductively cooled laser diode array pumped laser
[AD-D012217] N86-30143

CONFERENCES
Proceedings of the 2nd Workshop on Planning and Sensing for Autonomous Navigation
[DE86-006813] N86-29808
Heat Transfer and Cooling in Gas Turbines
[AGARD-CP-390] N86-29823
Proceedings of the 2nd Annual Conference on NASA/University Advanced Space Design Program
[NASA-TM-89399] N86-29888
Eighth Symposium (International) on Detonation, volume 3
[DE86-006785] N86-30028
Proceedings of the 1985 Antenna Applications Symposium, volume 1

Proceedings of the Ninth DOE Solar Photochemistry Research Conference
[DE86-006167] N86-30252
Acta Optica Sinica (selected articles)
[AD-A166281] N86-30495
Proceedings of the Second Workshop on Ion Mixing and Surface Layer Alloying
[DE86-006159] N86-30547
Scientific and technical papers presented or published by JSC authors in 1985
[NASA-TM-58273] N86-30568
Trajectory determinations and collection of micrometeoroids on the space station. Report of the Workshop on Micrometeorite Capture Experiments
[NASA-CR-177303] N86-30584

CONFIDENCE
Confidence regions for variance components in unbalanced mixed linear models
[AD-A165841] N86-30428

CONFIDENCE LIMITS
Confidence regions for variance components in unbalanced mixed linear models
[AD-A165841] N86-30428

CONFIGURATION INTERACTION
On the extension of the MCSCF/CI method
[NASA-CR-176933] N86-29924
The nature of chemisorbed oxygen on Ni(100) and Cu(100) N86-29925
Theoretical research program to study chemical reactions in AOTV bow shock tubes
[NASA-CR-176992] N86-30373
Integral processing in beyond-Hartree-Fock calculations N86-30374
Benchmark full configuration-interaction calculations on H2O, F- and F N86-30375
Benchmark full configuration-interaction calculations on HF and NH2 N86-30376
On the electron affinity of the oxygen atom N86-30377

CONFIGURATION MANAGEMENT
Shaft mode shape demonstration N86-30202

CONFORMAL MAPPING
Investigations on improved iterative methods for solving sparse systems of linear equations
[AD-A166170] N86-30431

CONICAL BODIES
Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-176902] N86-29771

CONICAL NOZZLES
Computation of dense spray jets
[DE86-008176] N86-30118

CONSTITUTIVE EQUATIONS
Integrated research in constitutive modelling at elevated temperatures, part 1
[NASA-CR-177237] N86-30227
Integrated research in constitutive modelling at elevated temperatures: Summary of the project N86-30228
Numerical considerations in the development and implementation of constitutive models N86-30229
Evaluation of the numerical stability and sensitivity of material parameter variations for several unified constitutive models
[MM-4998-85-6-PT-1] N86-30230
On the use of internal state variables in thermoviscoplastic constitutive equations N86-30231
A comparison of current models for nonlinear rate-dependent material behavior of crystalline solids N86-30232

CONSTRAINTS
The expanded LaGrangian system for constrained optimization problems
[NASA-CR-178142] N86-30426

CONTAINMENT
Review of fracture properties of nuclear materials determined by Hertzian indentation
[DE86-005520] N86-30238
General-Purpose Heat Source safety verification test series: SVT-1 through SVT-6
[DE85-017956] N86-30489

CONTINENTAL SHELVES
Geology and petroleum resources of the Barents-northern Kara shelf in light of new geologic data
[DE86-008472] N86-30247
Continental shelf processes affecting the oceanography of the South Atlantic Bight
[DE86-008212] N86-30301

CONTINENTS
Volatile components and continental material of planets
[NASA-TM-88478] N86-30615

CONTINUITY (MATHEMATICS)
Continuity of convexity preserving functions
[IR-237] N86-30441

CONTINUOUS WAVE LASERS
Investigation of basic characteristics of laser heating in thermoluminescence and of laser-stimulated luminescence
[AD-A166089] N86-30138

CONTINUUM MECHANICS
Failure propagation in continuum models of LSS (Large Space Structures), part 1
[AD-A166208] N86-29892

CONTINUUM MODELING
Failure propagation in continuum models of LSS (Large Space Structures), part 1
[AD-A166208] N86-29892

CONTRACT INCENTIVES
Small Business Innovation Research, Abstracts of Phase 2 awards, 1985
[DE86-005392] N86-30567

CONTRACTION
Chemically cross-linked heat-shrinkable polyethylene tubes
[AD-A166745] N86-29997

CONTROL ROCKETS
Vectored thrust digital flight control for crew escape, volume 2
[AD-A166596] N86-29799

CONTROL STABILITY
Anti-swirling demonstration N86-30196

CONTROL SYSTEMS DESIGN
Multi-variable control of the GE T700 engine using the LQG/LTR design methodology
[NASA-CR-177080] N86-29819
Introduction to robust multivariable control
[AD-A165891] N86-29869
Control of windpowered station with variable speed; small range
[FOA-C-20600-E3] N86-30261
A canonical form for nonlinear systems
[NASA-CR-176974] N86-30371
Application of input signal design in system identification for adaptive control
[ER-84/04] N86-30414

CONTROL THEORY
Vectored thrust digital flight control for crew escape, volume 1
[AD-A166580] N86-29798
Vectored thrust digital flight control for crew escape, volume 2
[AD-A166596] N86-29799
Optimal landing of a helicopter in autorotation
[NASA-CR-177082] N86-29809
Model-following control for an oblique-wing aircraft
[NASA-TM-88269] N86-29867
Introduction to robust multivariable control
[AD-A165891] N86-29869
Magnetic bearings for vibration control N86-30185
Approximations of nonlinear systems having outputs
[NASA-CR-176946] N86-30417
Control of nonlinear systems using fixed point theorems
[INPE-3923-PRE/957] N86-30454

CONTROLLERS
Intelligent N/C controllers
[DE86-003132] N86-30387

CONVECTION
The effect of finite Blob size on the current convective instability in the auroral ionosphere
[AD-A166806] N86-30278

CONVECTION CLOUDS
A cumulus parameterization study with special attention to the Arakawa-Schubert scheme
[AD-A166801] N86-30277

CONVECTION CURRENTS
A cumulus parameterization study with special attention to the Arakawa-Schubert scheme
[AD-A166801] N86-30277

CONVECTIVE FLOW
Two-dimensional flux-corrected transport solver for convectively dominated flows
[DE86-005329] N86-30106

CONVECTIVE HEAT TRANSFER
The measurement of local heat transfer coefficients in blade cooling geometries N86-29548
Convective heat transfer from circular cylinders located within perforated cylindrical shrouds
[NASA-CR-4005] N86-30100
Calculating the temperature and stresses when one side of a plate is heated with a constant flow of heat
[BLL-M-36723-(5828.4)] N86-30226

CONVERGENCE
On compactness of admissible parameter sets: Convergence and stability in inverse problems for distributed parameter systems
[NASA-CR-178128] N86-30423
Descriptive complexity of function spaces
[IR-278] N86-30465

CONVEXITY
Dimension of binary convex structures
[IR-226] N86-30440
Continuity of convexity preserving functions
[IR-237] N86-30441

COOLANTS
Bearing tester data compilation analysis, and reporting and bearing math modeling
[NASA-CR-176909] N86-30205

COOLING
Self-retained platform cooling plate for turbine vane
[AD-D012218] N86-29822
Chemically cross-linked heat-shrinkable polyethylene tubes
[AD-A166745] N86-29997
A conductively cooled laser diode array pumped laser
[AD-D012217] N86-30143

COOLING FINS
Self-retained platform cooling plate for turbine vane
[AD-D012218] N86-29822
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins N86-29827

COOLING SYSTEMS
Heat Transfer and Cooling in Gas Turbines
[AGARD-CP-390] N86-29823
Cooling techniques for gas turbine airfoils: A survey
N86-29824
Rotating heat transfer investigations on a multi-pass cooling geometry N86-29825
Local and mean heat transfer on the leading and trailing surfaces of a square-sectioned duct rotating in the orthogonal-mode N86-29826
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins N86-29827
Effects of hole geometry, wall curvature and pressure gradient on film cooling downstream of a single row --- gas turbine cooling N86-29831
Engine tests on a cooled gas turbine stage
N86-29836
Heat transfer test evaluation of the shell-spar blade cooling concept applied to industrial gas turbines
N86-29837
A model for correlating flat plate film cooling effectiveness for rows of round holes N86-29840
Alternate cooling configurations for gas turbine combustion systems N86-29845
Full coverage impingement heat transfer: The variation in pitch to diameter ratio at a constant gapp
N86-29846
Cooling techniques for turbojet pre-heater channels
N86-29847
Heat exchangers in regenerative gas turbine cycles
N86-29857
Ceramic heat exchangers for gas turbines or turbojet engines N86-29858
Effect of film cooling on the aerodynamic performance of a turbine cascade N86-29859
Theory and experimental study of a 3-D jet introduced into the secondary flow of a turbine inlet guide vane
N86-29860
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades N86-29861
The boundary layer behaviour of an advanced gas turbine rotor blade under the influence of simulated film cooling N86-29862
COORDINATES
A canonical form for nonlinear systems
[NASA-CR-176974] N86-30371
COPOLYMERIZATION
Synthesis of model polymers and related structures in support of vinyl monomer grafting studies
[DE86-008204] N86-30006
COPPER
The nature of chemisorbed oxygen on Ni(100) and Cu(100) N86-29925
Cluster-model calculation of raman intensity for vibration of CO adsorbed on copper
[AD-A166239] N86-29934
Computer simulations of the structure and properties of grain boundary dislocations
[DE86-007005] N86-29977
Effects of 500 keV electron irradiation and subsequent annealing on 1/f noise in copper films
[DE86 002954] N86-30540
COPPER ALLOYS
Theoretical studies of chemisorption on copper nickel alloys and surface embrittlement
[DE86-007034] N86-29971
Cryogenic mechanical properties of Al-Cu-Li-Zr alloy 2090
[DE86-006285] N86-29976
COPPER OXIDES
On the low-lying states of CuO N86-29928
CORIOLIS EFFECT
Local and mean heat transfer on the leading and trailing surfaces of a square-sectioned duct rotating in the orthogonal-mode N86-29826
Spectral study of turbulence. Pure rotation and introduction to mode composition
[ESA-86-97273] N86-30121
CORONAL LOOPS
Radiating shocks and condensations in flares
[DE86-005620] N86-30622
CORRECTION
An entropy correction method for unsteady full potential flows with strong shocks
[NASA-TM-87769] N86-29777
CORROSION
Inhibiting corrosion cracking: Crack tip chemistry and physics
[AD-A166317] N86-29966
Corrosion of vanadium and the alloy V 3Ti 1Si in flowing lithium
[KFK-4006] N86-29986
Technical issues and requirements of experiments and facilities for fusion nuclear technology, FINESSE phase 1, volume 2
[DE86-006503] N86-30511
CORROSION PREVENTION
Inhibiting corrosion cracking: Crack tip chemistry and physics
[AD-A166317] N86-29966
Increase of life of threaded joints of tube couplings in oil pipeline range through use of anticorrosion coatings
[BLL-M-36718-(5828.4)] N86-29987
CORROSION RESISTANCE
Microstructural formation and effects on the performance of platinum modified aluminide coatings
[AD-A166166] N86-29963
Microstructure effects on ion and electron transport parameters during passive corrosion of zircaloy
[DE86-007189] N86-29979
CORRUGATING
A simple circular-polarized antenna: Circular waveguide horn coated with lossy magnetic material
[NASA-CR-177092] N86-30039
CORTICOSTEROIDS
A possible role for endogenous glucocorticoids in orchiectomy-induced atrophy of the rat levator ani muscle: Studies with RU38486, a potent and selective antiglucocorticoid
[NASA-CR-177029] N86-30343
COSMIC DUST
Trajectory determinations and collection of micrometeoroids on the space station. Report of the Workshop on Micrometeorite Capture Experiments
[NASA-CR-177303] N86-30584
Interplanetary dust: The interstellar connection
N86-30587
The use of tethered satellites for the collection of cosmic dust and the sampling of man made orbital debris far from the space station N86-30589
Laser microprobe study of cosmic dust (IDPs) and potential source materials N86-30591
Hypervelocity particle capture: Some considerations regarding suitable target media N86-30592
Targeted flight opportunities with large area collectors
N86-30597
Dust collection on serviceable satellites N86-30599
Intact capture of hypervelocity particles N86-30603
Cosmic dust detection with large surface piezoceramics N86-30604
A micrometeoroid deceleration and capture experiment: Conceptual experiment design description N86-30605
Precision requirements on cosmic dust trajectory measurements N86-30607
COSMOCHEMISTRY
Interplanetary dust: The interstellar connection
N86-30587
COSTS
Differences between Hermes, US shuttle highlighted
N86-29883
A program manager's guide on multiyear procurement
[AD-A166463] N86-30566
COULOMB POTENTIAL
Effect of coulomb spline on rotor dynamic response
N86-30177
COUNTER ROTATION
Backward whirl in a simple rotor supported on hydrodynamic bearings N86-30172
COUNTERMEASURES
Anti-satellite weapons, countermeasures, and arms control
[PB86-182953] N86-30031
COUNTING
Counting numbers representable as sums of two squares
[LUT-MR-180] N86-30418
COUPLERS
Wide-band distributed RF coupler
[AD-D012214] N86-30049
COUPLING
Asymmetrical coupled coplanar-type transmission lines with anisotropic substrates N86-30038
Wide-band distributed RF coupler
[AD-D012214] N86-30049
Theoretical investigation of the scattering of the rotation-bending coupling, and study of intensity weakening using an optical model: Calculations for the systems H2-LiF(001) and HD-Ag(111)
[MPIS-16/1985] N86-30483
COVALENT BONDS
Graph theory in the study of metal cluster bonding topology: Applications to metal clusters having fused polyhedra
[AD-A166623] N86-29937
CRACK GEOMETRY
Investigation of delamination of a composite bar --- carbon fiber/epoxy
[ONERA-RT-9/3542-RY-044-R] N86-29923
CRACK INITIATION
Mechanism of stress-corrosion cracking of Alloy X-750 in high purity water
[DE86-006361] N86-29969
Compliance matrices for cracked bodies
[NASA-CR-179478] N86-30236
Investigation of the extent and nature of the cracks found in segments of two Cr - 0.5 Mo pressure vessels from the NIL residual creep life program
[MR/814/85] N86-30242
CRACK PROPAGATION
National Transportation Safety Board safety recommendation
[NTSB-4357/1] N86-29792
Failure propagation in continuum models of LSS (Large Space Structures), part 1
[AD-A166208] N86-29892
Determination of the basic parameters in the micromechanical behavior of composite materials
[ONERA-RT-41/7086-M] N86-29922
Inhibiting corrosion cracking: Crack tip chemistry and physics
[AD-A166317] N86-29966
Mechanism of stress-corrosion cracking of Alloy X-750 in high purity water
[DE86-006361] N86-29969
Elasticity, tear strength and strength of adhesion of soft PVC gels
[AD-A166356] N86-29994
Cutting of metal components by intergranular cracking
[DE86-006949] N86-30213
Failure analysis and microcrack dependent discontinuum mechanics
[DE86-006710] N86-30240
CRACKING (FRACTURING)
Compliance matrices for cracked bodies
[NASA-CR-179478] N86-30236
CRACKS
Cracked shaft detection on large vertical nuclear reactor coolant pump N86-30180
Cracked rotor demonstration N86-30200
Cutting of metal components by intergranular cracking
[DE86-006949] N86-30213
CRASH LANDING
Full-Scale Transport Controlled Impact Demonstration Program photographic/video coverage
[DOT/FAA/CT-85/35] N86-29795
Post Controlled Impact Demonstration (CID) analysis
N86-30010
Antimisting kerosene: Evaluation of improved FM-9 additive
[DOT/FAA/CT-85-4] N86-30024
CRASHWORTHINESS
Full-Scale Transport Controlled Impact Demonstration Program photographic/video coverage
[DOT/FAA/CT-85/35] N86-29795
CRAY COMPUTERS
Comparison of the CRAY X-MP-4, Fujitsu VP-200, and Hitachi S-810/20: An Argonne perspective
[DE86-006665] N86-30389
CREEP PROPERTIES
Experiments and micromechanical models for creep-rupture in polymer matrix composites
[DE86-007980] N86-29916
Investigations of creep cavitation in type 304 stainless steel
[DE86-007187] N86-29978
A viscoelastic-damage simulation model for filament-wound pressure vessels
[AD-A166389] N86-30208
Creep and fracture characteristics of materials and structures at elevated temperatures
[AD-A166575] N86-30237
CREEP RUPTURE STRENGTH
Experiments and micromechanical models for creep-rupture in polymer matrix composites
[DE86-007980] N86-29916
CREEP STRENGTH
Investigation of the extent and nature of the cracks found in segments of two Cr - 0.5 Mo pressure vessels from the NIL residual creep life program
[MR/814/85] N86-30242
CREEP TESTS
Investigation of the extent and nature of the cracks found in segments of two Cr - 0.5 Mo pressure vessels from the NIL residual creep life program
[MR/814/85] N86-30242
CREWS
Task Force report on emergency evacuation of transport airplanes, volume 1
[DOT/FAA/VS-86/1.1] N86-29793
CRITERIA
Criteria for the choice of work pieces for conventional or Numerical-Control (NC) manufacturing (turning, drilling, and cutting)
[JUEL-SPEZ-338] N86-30030
Models and prediction of turbulent flow with suspended particles
[ONERA-RT-22/7135-EY] N86-30122

CRITICAL PRESSURE
Two-phase flows within systems with ambient pressure N86-30167
CROSS FLOW
Experimental results of the control of a vortical flow by tangential blowing
[NASA-CR-176932] N86-30094
CROSSLINKING
Phenylquinoxaline resin compositions
[AD-D012230] N86-29912
Chemically cross-linked heat-shrinkable polyethylene tubes
[AD-A166745] N86-29997
Phenylquinoxaline resin monomers
[AD-D012236] N86-29998
CRUDE OIL
Geology and petroleum resources of the Barents-northern Kara shelf in light of new geologic data
[DE86-008472] N86-30247
CRUISING FLIGHT
Noise predictions of a high bypass turbofan engine using the Lockheed Near-Field Noise Prediction Program
[NASA-CR-178146] N86-30469
CRYOGENIC EQUIPMENT
Dynamics insulation systems
[NASA-CR-177026] N86-30554
CRYOGENIC FLUID STORAGE
Dynamics insulation systems
[NASA-CR-177026] N86-30554
CRYOGENIC MAGNETS
Cryogenic mechanical properties of high-manganese steel weldments
[DE86-005219] N86-30212
CRYOGENIC ROCKET PROPELLANTS
Oxidizer heat exchanger component testing
[NASA-CR-179487] N86-29901
CRYOGENIC WIND TUNNELS
Effect of Reynolds Number and Mach Number on flow angularity probe sensitivity
[NASA-TM-87750] N86-29774
Cryogenic wind tunnels for high Reynolds number testing
[NASA-TM-87743] N86-29872
Thermal sensing of cryogenic wind tunnel model surfaces
[NASA-CR-178136] N86-30098
CRYOGENICS
Cryogenic explosion environment modeling and testing of space shuttle and light-weight radioisotope heater unit interactions
[DE86-005901] N86-29881
Cryogenic mechanical properties of Al-Cu-Li-Zr alloy 2090
[DE86-006285] N86-29976
Cryogenic mechanical properties of high-manganese steel weldments
[DE86-005219] N86-30212
CRYSTAL DEFECTS
Local density theory of heats of formation and short-range order parameters in substitutionally disordered alloys
[DE86-007979] N86-29982
Effects of 500 keV electron irradiation and subsequent annealing on 1/f noise in copper films
[DE86-002954] N86-30540
Topics in precipitation and ordering reactions and their related phenomena
[DE86-007483] N86-30549
Imaging of surfaces and defects of crystals
[DE86-008302] N86-30552
CRYSTAL DISLOCATIONS
Computer simulations of the structure and properties of grain boundary dislocations
[DE86-007005] N86-29977
CRYSTAL FILTERS
A study of group-type single-phase unidirectional SAW transducers on LiNbO3 and quartz — bandpass filters
[AD-A165670] N86-30067
CRYSTAL GROWTH
Ferroelectric tungsten bronze crystals for far infrared electro-optic device applications
[AD-A166484] N86-30531
Microstructural dynamics of primary and secondary recrystallization
[DE86-006046] N86-30536
Computer simulation of microstructural dynamics
[DE86-006045] N86-30541
CRYSTAL OPTICS
Ferroelectric tungsten bronze crystals for far infrared electro-optic device applications
[AD-A166484] N86-30531
CRYSTAL STRUCTURE
Structural characterization and gas reactions of small metal particles by high-resolution TEM and TED
[NASA-CR-176949] N86-29959
Comparative studies of electron affinities and work functions for GaAs amd Si
[AD-A166225] N86-30523
Pseudopotentials and structure-property relationships in the solid state
[AD-A166385] N86-30530
Topics in precipitation and ordering reactions and their related phenomena
[DE86-007483] N86-30549
CRYSTAL SURFACES
Imaging of surfaces and defects of crystals
[DE86-008302] N86-30552
CRYSTALLIZATION
Chalcogenide glasses. Part 3: Chalcogenide glass-forming systems
[AD-A166592] N86-29996
Preparation and optical properties of GA(x)IN(1-x)P alloys
[NASA-TM-88431] N86-30518
Anomalous behavior during the solidification of silicon in the presence of impurities
[DE86-007395] N86-30548
CRYSTALS
Scanning electron microscope study of nitroguanidine, M31A1 and m30 propellants
[AD-A166669] N86-30027
CULTURE TECHNIQUES
Effects of simulated weightlessness on meiosis. Fertilization, and early development in mice
[NASA-CR-177106] N86-30342
CUMULUS CLOUDS
A cumulus parameterization study with special attention to the Arakawa-Schubert scheme
[AD-A166801] N86-30277
CURING
Differences in interfacial bond strengths of graphite fiber-epoxy resin composites
[NASA-CR-176912] N86-29905
UV cured epoxide coating
[DE86-003728] N86-30001
CURRENT DENSITY
Electrode kinetic measurements of very fast reactions: Metal deposition-dissolution in molten halides
[DE86-006109] N86-29945
Flux pinning by grain boundaries in A15 superconductors
[DE86-006250] N86-30538
CURVE FITTING
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] N86-29772
CUTTING
Criteria for the choice of work pieces for conventional or Numerical-Control (NC) manufacturing (turning, drilling, and cutting)
[JUEL-SPEZ-338] N86-30030
Cutting of metal components by intergranular cracking
[DE86-006949] N86-30213
CYCLES
Aging of carbon-epoxy composite in humid environments
[PV-42-791/F] N86-29921
CYCLIC LOADS
Investigation of surface strains in fir tree turbine blade attachments
[AD-A166330] N86-29821
Effects of thermal and cyclic loads on silicon carbide yarn reinforced glass matrix composites
[DE86-006793] N86-29913
A literature review on the influence of small-amplitude cyclic loading on stress-corrosion cracking in alloys
[AD-A166403] N86-29967
Resilient modulus of freez-thaw affected granular soils for pavement design and evaluation. Part 1: Laboratory tests on soils from Winchendon, Massachusetts, test sections
[FAA/PM-84/16.1] N86-30029
CYCLOTRON RESONANCE DEVICES
Infrared monitoring of gyrotron windows
[DE86-002449] N86-30134
CYLINDRICAL BODIES
Convective heat transfer from circular cylinders located within perforated cylindrical shrouds
[NASA-CR-4005] N86-30100
CZOCHRALSKI METHOD
Investigation of oxide and fluoride hosts for blue-green lasers
[AD-A166620] N86-30142
Research in Gadolinium Scandium Gallium Garnet (GSGG) crystal development
[DE86-004292] N86-30532

D

D REGION
The influence of negative ions on the incoherent diffusion of electromagnetic waves in the D region of the ionosphere
[AERONOMICA-ACTA-A-302-1985] N86-30269
DAMAGE
A viscoelastic-damage simulation model for filament-wound pressure vessels
[AD-A166389] N86-30208
Versatile laser glass inspection and damage testing facility
[DE86-006306] N86-30502
DAMPING
Certain rules governing damping of vibrations in two-phase alloys
[BLL-M-36760-(5828.4)] N86-29954
Experimental investigation of resistive damping elements — acoustic waves
[MPIS-19/1985] N86-30475
DARKNESS
The effect of background luminance and ambient illumination on color discrimination in a CRT display
[AD-A166297] N86-30496
DATA ACQUISITION
Analogue signal conditioning for flight test instrumentation
[AGARD-AG-160-VOL-17] N86-29816
A 3-component laser-Doppler velocimeter data acquisition and reduction system
[NASA-CR-176929] N86-30135
Data collection and analysis for HCl, SO2, and NO2 immission-emission differential absorption lidars
[GKSS-85/E/53] N86-30268
Multiparameter data acquisition systems for studies of Circadian rhythms
[DE86-004041] N86-30308
Proceedings of the 1984 CERN School of Computing
[DE86-700783] N86-30355
Measuring the software process and product: Lessons learned in the SEL N86-30358
Introduction to the Fastbus
[DE86-005830] N86-30578
DATA BASE MANAGEMENT SYSTEMS
A relational database environment for software development
[IR-86] N86-30398
Design of a Data Storage Hierarchy DSH-i2: Software and hardware
[AD-A166287] N86-30571
The role of databases in knowledge-based systems
[AD-A166365] N86-30573
GIS (Geographic Information System)-based applications with a worldwide database
[AD-A166825] N86-30575
DATA BASES
Failure control techniques for the SSME, phase 1
[NASA-CR-178845] N86-29900
Database assessment of pollution control in the military explosives and propellants production industry
[AD-A165853] N86-30264
The stability of low-latitude sea-surface temperatures: An evaluation of the CLIMAP reconstruction with emphasis on the positive SST anomalies
[DE85-016190] N86-30300
Search and retrieval of office files using dBASE 3
[NASA-TM-86550] N86-30378
Dataflow architectures
[AD-A166235] N86-30407
The DoD gateway information system: Prototype experience
[AD-A166200] N86-30570
Design of a Data Storage Hierarchy DSH-i2: Software and hardware
[AD-A166287] N86-30571
The role of databases in knowledge-based systems
[AD-A166365] N86-30573
GIS (Geographic Information System)-based applications with a worldwide database
[AD-A166825] N86-30575
DATA FLOW ANALYSIS
Dataflow architectures
[AD-A166235] N86-30407
DATA LINKS
Fiber optical data link extension for the IEC-625 interface bus
[ESA-86-97532] N86-30505
DATA PROCESSING
A radar data processing and enhancement system
[NASA-TM-88274] N86-29884
On some equivalent configurations of systolic arrays N86-30070

Optimization of an interactive distributive computer network
[NASA-CR-177373] N86-30405
Translation table for DOE/OSTI - COSATI bibliographic records to MARC format records
[DE86-006473] N86-30576
Introduction to the Fastbus
[DE86-005830] N86-30578

DATA PROCESSING TERMINALS
Data transmission systems circuits and exchange parameters on the C3 interface in the case of the parallel input-output of discrete information
[AD-A166206] N86-30044

DATA RECORDING
Micro mushroom instrumentation system
[AD-D012235] N86-30078

DATA REDUCTION
A 3-component laser-Doppler velocimeter data acquisition and reduction system
[NASA-CR-176929] N86-30135

DATA STORAGE
Digital magnetic tape mass memory store
[BMFT-FB-T-85-151] N86-30356
Dataflow architectures
[AD-A166235] N86-30407
Design of a Data Storage Hierarchy DSH-i2: Software and hardware
[AD-A166287] N86-30571
GIS (Geographic Information System)-based applications with a worldwide database
[AD-A166625] N86-30575

DATA SYSTEMS
Scientific and technical information search and service in the research and development of military products
[AD-A166300] N86-30572

DATA TRANSMISSION
Data transmission by radar --- jamming resistance
[REPT-8-85] N86-30032
Data transmission systems circuits and exchange parameters on the C3 interface in the case of the parallel input-output of discrete information
[AD-A166206] N86-30044
Round robin scheduling for fair flow control in data communication networks
[AD-A166728] N86-30047
A survey of the state of the art and focused research in range systems, task 2
[NASA-CR-176988] N86-30069
Introduction to the Fastbus
[DE86-005830] N86-30578

DAYTIME
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292

DEACTIVATION
Laser studies of halogens and oxygen
[AD-A166257] N86-30477

DECAMETRIC WAVES
Analysis of Jovian decamtenc data: Study of radio emission mechanisms
[NASA-CR-176878] N86-30619

DECELERATION
A micrometeoroid deceleration and capture experiment: Conceptual experiment design description N86-30605

DECISION MAKING
Overview of ROME: A reason-Oriented Modeling Environment
[AD-A166259] N86-30411
Decision processes in influence diagrams: Formulation and analysis
[AD-A166327] N86-30565
Technology transfer and artificial intelligence
[AD-A166035] N86-30581

DECISION THEORY
Decision processes in influence diagrams: Formulation and analysis
[AD-A166327] N86-30565

DECISIONS
Decision processes in influence diagrams: Formulation and analysis
[AD-A166327] N86-30565

DECODING
Weighted decoding of block linear codes
[ENST-86E001] N86-30395

DECOMPOSITION
Particles and gases produced by cutting fiber composites with a 250 W continuous wave carbon dioxide laser
[FOA-C-20599-D6] N86-29918
Spin-coated amorphous chalcogenide resists spin-coated amorphous chalcogenide glasses
[AD-A166270] N86-29991
Laser-assisted solar cell metallization processing
[DE86-008328] N86-30260

DECOMPRESSION SICKNESS
Hypobaric training of flight personnel without compromising quality of life N86-30327

DECOUPLING
Flight test of a decoupler pylon for wing/store flutter suppression
[NASA-TM-87767] N86-29814

DEFECTS
Use of acoustic emission in study of defects in butt weld during cooling
[BLL-M-36732-(5828.4)] N86-30221

DEFENSE PROGRAM
US Army Fire Resistant Fuel (FRF) program presentation to FAA Aviation Fuel Safety Meeting N86-30014
Electronics Division research and development
[DE86-008327] N86-30083
The DoD gateway information system: Prototype experience
[AD-A166200] N86-30570

DEFORMATION
Use of miniaturized tests to predict flow properties and estimate fracture toughness in deformed steel plates
[DE86-007644] N86-29981
Microstructure, microchemistry, and microdeformation of Alloy 600 tubing
[DE86-007947] N86-29983
Small angle neutron scattering study on a polymer blend: Characterization of the deformation behavior
[DE86-006099] N86-30003
Computational significance of the intermediate configuration and hyperelastic stress relations in finite deformation elastoplasticity
[DE86-008720] N86-30239
Point defects and high-temperature deformation of NiO
[DE86-005560] N86-30534

DEGRADATION
Antimisting fuel technology for transport category aircraft N86-30008
AMK full-scale transport aircraft validation phase summary N86-30009
Heat transfer, friction, and rheological characteristics of antimisting kerosene N86-30013

DELAMINATING
Investigation of delamination of a composite bar --- carbon fiber/epoxy
[ONERA-RT-9/3542-RY-044-R] N86-29923

DELAY LINES
Internal Side-looking Airborne Radar (SLAR) calibration
[185.68220.002] N86-30062

DELTA WINGS
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] N86-29772
An investigation of empennage buffeting
[NASA-CR-176973] N86-29864
Active flutter suppression on a delta wing model structure
[DFVLR-FB-86-01] N86-29870
Experimental results of the control of a vortical flow by tangential blowing
[NASA-CR-176932] N86-30094

DENSIFICATION
Simultaneous combustion synthesis and densification of refractory materials
[DE86-006528] N86-29939

DENSITY (NUMBER/VOLUME)
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895

DENSITY MEASUREMENT
Optical diagnostics of gas-dynamic flows using advanced laser measurement techniques
[NASA-CR-176950] N86-30095
Design and fabrication of an actively cooled Langmuir probe for long pulse applications
[DE86-005231] N86-30507

DEPOSITION
Numerical simulation of the flowfield over ice accretion shapes
[NASA-CR-176960] N86-30093
Research on high-efficiency, single-junction, monolithic, thin-film amorphous silicon solar cells
[DE86-004420] N86-30258
Laser-assisted solar cell metallization processing
[DE86-008328] N86-30260
Study of surfaces and surface layers on high temperature materials after short-time thermal loads --- tokamaks
[JUEL-2024] N86-30514
Light-induced excess conductivity and the role of argon in the deposition of doping-modulated amorphous silicon superlattices
[DE86-005812] N86-30535

DESERTS
A procedure for evaluation of dust potential in desert terrains
[AD-A166491] N86-30245

DESIGN ANALYSIS
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] N86-29815
Transmission line design for a power distribution system at 20 kHz for aircraft
[NASA-CR-3987] N86-29910
The design of multirate digital control systems
[NASA-CR-177126] N86-29963
Imaging and sounding instruments in the spin stabilized version of the second generation Meteosat
[REPT-80/1568] N86-29999
Double-injection, deep-impurity switch development
[NASA-CR-174936] N86-30073
Study of heat exchangers between a liquid loop feeder and a heat-pipe radiator --- spacecraft thermal control
[FOK-TR-R-84-108] N86-30089
Design and initial testing of a one-bladed 30-meter-diameter rotor on the NASA/DOE mod-0 wind turbine
[NASA-TM-88810] N86-30251
Design considerations for stand-alone photovoltaic systems
[DE86-006470] N86-30253
The computer-aided analytic process model. Operations handbook for the analytic process model demonstration package
[AD-A166180] N86-30381

DETECTION
Submerged arc welding control via arc sensing
[AD-A166320] N86-30207
Auditory helicopter detection and localization; a literature review focusing on search for helicopters
[FOA-C-50033-H2] N86-30474
Orbital debris measurements N86-30580
Cosmic dust detection with large surface piezoceramics N86-30604
Capacitor-type micrometeoroid detectors N86-30606

DETECTORS
Acoustic penetration and impact detector for micrometeoroid and space debris application N86-30608

DETONATION
Eighth Symposium (International) on Detonation, volume 3
[DE86-006785] N86-30028

DEVIATION
Repeatability study of a 6-axis robot
[DE86-006417] N86-30210

DF LASERS
Pulsed chemical laser technology development test plan single pulse diagnostic testing
[AD-A166203] N86-30140

DIAGNOSIS
Application of artificial intelligence techniques to fault diagnosis for printed circuits
[ENST-85E011] N86-30413

DIAGRAMS
Decision processes in influence diagrams: Formulation and analysis
[AD-A166327] N86-30565

DIAMETERS
In situ high voltage electron microscope studies of ion- and electron-beam induced modification of materials
[DE86-005577] N86-30491

DIATOMIC MOLECULES
On the low-lying states of CuO N86-29828
Cluster-model calculation of raman intensity for vibration of CO adsorbed on copper
[AD-A166239] N86-29934

DICTIONARIES
NASA thesaurus supplement
[NASA-SP-7053-SUPP-1] N86-30588

DIELECTRICS
Theory and analysis of soft X-ray laser experiments
[DE86-005177] N86-30149
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166242] N86-30524
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166274] N86-30527
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166290] N86-30528
Pseudopotentials and structure-property relationships in the solid state
[AD-A166385] N86-30530

DIESEL FUELS
US Army Fire Resistant Fuel (FRF) program presentation to FAA Aviation Fuel Safety Meeting N86-30014

DIFFERENTIAL EQUATIONS
Shared memory, cache, and frontwidth considerations in multifrontal algorithm development
[DE86-007245] N86-30393
Iterative methods for nondefinite symmetric systems, with application to a discrete Stokes problem
[ESA-86-97548] N86-30416
Convenient stability criteria for difference approximations of hyperbolic initial-boundary value problems
[NASA-CR-178134] N86-30422
Analysis of dynamical systems
[AD-A166224] N86-30433
Piecewise analytical perturbation series methods for solving linear ordinary differential equations. Part 2: The radial Schroedinger equations
[DE86-700606] N86-30438
Control of nonlinear systems using fixed point theorems
[INPE-3923-PRE/957] N86-30454
DIFFERENTIAL INTERFEROMETRY
Data collection and analysis for HCl, SO2, and NO2 emission-emission differential absorption lidars
[GKSS-85/E/53] N86-30268
DIFFRACTION
Mean trajectory gaussian wave packet approach to inelastically inelastic molecule-surface diffraction
[AD-A166275] N86-30478
DIFFRACTION PATTERNS
Varied line-space gratings: past, present and future
[DE86-007498] N86-30503
DIFFUSION
Applications of laser annealing and laser-induced diffusion to photovoltaic conversion
[DE86-003809] N86-30254
Analysis of dynamical systems
[AD-A166224] N86-30433
DIFFUSION COEFFICIENT
Process of structure formation of sintered steel Kh6V3M
[BLL-M-36781-(5628.4)] N86-29957
DIGITAL COMMAND SYSTEMS
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-88265] N86-29813
Experience with synchronous and asynchronous digital control systems
[NASA-TM-88271] N86-29866
DIGITAL DATA
Digital magnetic tape mass memory store
[BMFT-FB-T-85-151] N86-30356
DIGITAL FILTERS
A digital filter for removing known components from spectroscopic data
[AD-A166680] N86-30385
DIGITAL NAVIGATION
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-88265] N86-29813
DIGITAL SYSTEMS
HYTESS 2: A Hypothetical Turbofan Engine Simplified Simulation with multivariable control and sensor analytical redundancy
[NASA-TM-87344] N86-30368
DIGITAL TECHNIQUES
The design of multirate digital control systems
[NASA-CR-177126] N86-29863
DIMENSIONAL ANALYSIS
Two dimensional analytical considerations of large magnetic and electric fields in laser produced plasmas
[DE86-00235] N86-30512
DIMENSIONAL MEASUREMENT
Scanning electron microscope study of nitroguanidine, M31A1 and m30 propellants
[AD-A166669] N86-30027
DIMENSIONS
Dimension of binary convex structures
[IR-226] N86-30440
DIMERS
Theoretical research program to study transition metal trimers and embedded clusters
[NASA-CR-176948] N86-29885
DIODES
Thermal sensing of cryogenic wind tunnel model surfaces
[NASA-CR-178138] N86-30098
Numerical simulation of gain-guided diode laser arrays
[DE86-007833] N86-30157
DIRECT CURRENT
Field calculations of axisymmetric current coils in vacuum
[ESA-86-97547] N86-30058
DIRECTION FINDING
A collection of Area of Interest (AOI) algorithms
[NASA-CR-176984] N86-30404
DISCRETE FUNCTIONS
Preconditioning for first-order spectral discretization
[NASA-TM-87619] N86-30427
Walsh-Fourier analysis of discrete-valued time series
[AD-A166139] N86-30430
DISPLACEMENT
A comprehensive analysis algorithm for ablation, temperature fields and thermal stresses of the carbon-base rocketips
[AD-A166615] N86-29856
DISPLAY DEVICES
Feasibility study for ergonomic analysis and design of future helicopter cockpit systems
[NASA-CR-176942] N86-29811
The effects of color-coding in GEOSIT (geographical situational) displays. 2: Redundant versus non-redundant color-coding
[AD-A166263] N86-30334
Development of an algorithm to model an aircraft equipped with a generic CDTI display
[NASA-TM-87732] N86-30349
The effect of background luminance and ambient illumination on color discrimination in a CRT display
[AD-A166297] N86-30496
DISTANCE
Infrasound from distant rocket launches
[PB86-182771] N86-30476
DISTRIBUTED PARAMETER SYSTEMS
On compactness of admissible parameter sets: Convergence and stability in inverse problems for distributed parameter systems
[NASA-CR-178128] N86-30423
Control of nonlinear systems using fixed point theorems
[INPE-3923-PRE/957] N86-30454
State estimation and parameter identification of linear and semilinear distributed parameter systems
[INPE-3904-PRE/945] N86-30455
State estimation and parameter identification for semilinear distributed parameter systems
[INPE-3932-PRE/964] N86-30456
Control of nonlinear distributed parameter systems using fixed point techniques
[INPE-3922-PRE/956] N86-30457
DISTRIBUTED PROCESSING
Multiprocessor model with distributed task creation
[DE86-005302] N86-30354
One approach for evaluating the Distributed Computing Design System (DCDS) N86-30366
Protection and resource control in distributed operating systems
[IR-79] N86-30408
DISTRIBUTION FUNCTIONS
Mathematical and statistical characterizations of generalized hyperexponential distribution functions
[AD-A165892] N86-30448
DIURNAL VARIATIONS
Latitudinal variation of DS
[INPE-3906-PRE/947] N86-30270
DOCUMENTATION
Quality assurance software inspections at NASA Ames: Metrics for feedback and modification N86-30363
Search and retrieval of office files using dBASE 3
[NASA-TM-86550] N86-30378
Scientific and technical papers presented or published by JSC authors in 1985
[NASA-TM-58273] N86-30568
DOORS
Task force report on emergency evacuation of transport airplanes. Volume 2: Supporting documentation
[FAA/VS-86/1,2] N86-29797
DOPPLER EFFECT
Lorentz invariance and the rotor Doppler shift experiments
[DE86-700614] N86-30473
On experiments to detect possible failures of relativity theory
[DE86-700613] N86-30560
Considerations about the apparent superluminal expansions in astrophysics
[DE86-701328] N86-30613
DRAG CHUTES
Development drop test results of the 15-ft-dia ribbon parachute and 73-ft-dia cross parachute for the US Army Natick Laboratory UHLCADS System
[DE85-017614] N86-29785
DRAG REDUCTION
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] N86-29815
DRILLING
Criteria for the choice of work pieces for conventional or Numerical-Control (NC) manufacturing (turning, drilling, and cutting)
[JUEL-SPEZ-338] N86-30030
DROP SIZE
Olefin polymers as jet fuel antimist additives N86-30016
DROP TESTS
Development drop test results of the 15-ft-dia ribbon parachute and 73-ft-dia cross parachute for the US Army Natick Laboratory UHLCADS System
[DE85-017614] N86-29785
DROPS (LIQUIDS)
Hollow droplet generator for polymer shell production
[DE86-006482] N86-29999
Computation of dense spray jets
[DE86-008176] N86-30118
Modeling of flow fields in oscillating droplets
[DE86-008232] N86-30119
DUCTED FLOW
Local and mean heat transfer on the leading and trailing surfaces of a square-sectioned duct rotating in the orthogonal-mode N86-29826
DUST
Experimental observation of the structure of shock waves in dusty gas
[AD-A166301] N86-30103
A procedure for evaluation of dust potential in desert terrains
[AD-A166491] N86-30245
Stratospheric dust collections: Valuable resources for space and atmospheric scientists N86-30596
DUST COLLECTORS
Targeted flight opportunities with large area collectors N86-30597
A micrometeoroid deceleration and capture experiment: Conceptual experiment design description N86-30605
DYE LASERS
Pointing alignment by orthogonal phase-lock feedback loops
[DE86-006707] N86-30082
DYNAMIC CHARACTERISTICS
Improving the interpretability of an aircraft attitude indicator
[AD-A166329] N86-29817
Molecular dynamics of reactions forming electronically excited products
[AD-A166168] N86-29931
Measurement of rotor system dynamic stiffness by perturbation testing N86-30164
Some new results concerning the dynamic behavior of annular turbulent seals N86-30174
Measuring dynamic oil film coefficients of sliding bearing N86-30179
Pump instability phenomena generated by fluid forces N86-30181
Analysis of dynamical systems
[AD-A166224] N86-30433
DYNAMIC CONTROL
ACOSS eleven (Active Control Of Space Structures) a
[AD-A165864] N86-29890
DYNAMIC LOADS
Fatigue test machine
[AD-D012232] N86-30133
Some thoughts on the modeling of atmospheric turbulence from the perspective of a non-expert
[DE86-006498] N86-30281
DYNAMIC MODELS
Failure propagation in continuum models of LSS (Large Space Structures), part 1
[AD-A166208] N86-29892
DYNAMIC RESPONSE
Adaptive control system. Volume 1. Equipment and testing
[AD-A166036] N86-30074
Effect of coulomb spline on rotor dynamic response N86-30177
Partial rotor-to-stator rub demonstration N86-30197
DYNAMIC STRUCTURAL ANALYSIS
Structural dynamics and fluid flow in shell-and-tube heat exchangers. Summary and overview of a DOE/ECUT-sponsored research program
[DE86-007798] N86-30114
MECHAN: Dynamic analysis of planar mechanisms
[DE85-018023] N86-30214
Structures and Dynamics Division research and technology plans for FY 1986 and accomplishments for FY 1985
[NASA-TM-87742] N86-30235
DYNAMICAL SYSTEMS
Analysis of dynamical systems
[AD-A166224] N86-30433

E

EARTH ATMOSPHERE
Atmospheric carbon dioxide and the global carbon cycle
[DE86-006222] N86-30280

EARTH CRUST
Basic elements of nuclear geophysics
[DE86-700735] N86-30243
EARTH ORBITAL ENVIRONMENTS
Development of composite tube protective coatings
[NASA-CR-178116] N86-29989
Effects of the low Earth orbital environment on spacecraft materials N86-30595
EARTH RESOURCES
Geology and petroleum resources of the Barents-northern Kara shelf in light of new geologic data
[DE86-008472] N86-30247
Report on the phase A study of a joint Indonesian-Netherlands Tropical Earth Resources Satellite (TERS) program
[JTERS-84-10] N86-30249
EARTH TERMINALS
A satellite broadcast receiving terminal
[ESA-86-97317] N86-30057
ECCENTRIC ORBITS
Orbits: Computer simulation N86-30203
ECHOCARDIOGRAPHY
Selection and medical testing of Mirage 2000 pilots: Report of echocardiography N86-30314
ECONOMIC FACTORS
Estimate of the aerodynamic performances of tip vane rotors using the Helix program
[NLR-TR-85027-L] N86-29788
Aerodynamic research on tip vane rotors, carried out by NLR, and a rough evaluation of the tip vane concept
[NLR-TR-85064-L] N86-29789
ECONOMICS
Some tentative ideas on developing our low-alloy and alloy steel
[AD-A166269] N86-29964
Development of China's fiber optic technology discussed N86-30066
A program manager's guide on multiyear procurement
[AD-A166463] N86-30566
EDITING
A browser for directed graphs
[AD-A166622] N86-30383
Reference guide for using IGVIEW, an IGES compatible geometry display, editing, and analysis system
[DE86-007190] N86-30392
EDUCATION
United States Air Force Summer Faculty Research Program management report, 1985
[AD-A166175] N86-30561
United States Air Force Summer Faculty Research Program, 1985 technical report, volume 1
[AD-A166176] N86-30562
United States Air Force Summer Faculty Research Program, 1985 technical report, volume 2
[AD-A166177] N86-30563
United States Air Force Summer Faculty Research Program 1985 technical report, volume 3
[AD-A166178] N86-30564
EFFICIENCY
Combustion in IC engines
[DE86-007846] N86-29947
New and future heat pump technologies
[DE86-007866] N86-30117
EIGENVALUES
Eigensystem synthesis for active flutter suppression on an oblique-wing aircraft
[NASA-TM-88275] N86-29868
Eigenvalues and stability problems of rotors
N86-30192
The algorithm RMS-DIIS and an ALGOL program for the B-6800 computer to diagonalize large matrices
[INPE-3878-PRE/931] N86-30372
EIGENVECTORS
Eigensystem synthesis for active flutter suppression on an oblique-wing aircraft
[NASA-TM-88275] N86-29868
The algorithm RMS-DIIS and an ALGOL program for the B-6800 computer to diagonalize large matrices
[INPE-3878-PRE/931] N86-30372
EJECTA
Bilateral symmetry of circular impact structures of astroblemes
[NASA-TM-88480] N86-30616
EJECTION
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895
EJECTION SEATS
Vectored thrust digital flight control for crew escape, volume 1
[AD-A166580] N86-29796
Vectored thrust digital flight control for crew escape, volume 2
[AD-A166596] N86-29799
EJECTORS
Experiments on high speed ejectors
[NASA-CR-177419] N86-29620
ELASTIC DAMPING
Improvement and optimization of internal damping of fiber reinforced composite materials
[AD-A166173] N86-29909
ELASTIC DEFORMATION
Chemically cross-linked heat-shrinkable polyethylene tubes
[AD-A166745] N86-29997
A comparison of current models for nonlinear rate-dependent material behavior of crystalline solids
N86-30232
ELASTIC PROPERTIES
Investigation of surface strains in fir tree turbine blade attachments
[AD-A166330] N86-29821
A comprehensive analysis algorithm for ablation, temperature fields and thermal stresses of the carbon-base nosetips
[AD-A166615] N86-29896
Modeling of elastically mounted vertical rotor
N86-30168
A viscoelastic-damage simulation model for filament-wound pressure vessels
[AD-A166389] N86-30208
On the use of internal state variables in thermoviscoplastic constitutive equations N86-30231
Multigrid method for the equilibrium equations of elasticity using a compact scheme
[NASA-CR-178120] N86-30420
Elastic and inelastic surface effects on ion penetration and the resulting sputtering and backscattering
[DE85-016604] N86-30545
ELASTIC WAVES
Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025
ELASTOMERS
The influence of chemical structure on the strength of rubber
[AD-A166355] N86-29993
ELASTOPLASTICITY
Computational significance of the intermediate configuration and hyperelastic stress relations in finite deformation elastoplasticity
[DE86-006720] N86-30239
ELECTRIC ARCS
Charge accumulation and arc discharges on spacecraft materials and components
[AD-A166216] N86-29893
Submerged arc welding control via arc sensing
[AD-A166320] N86-30207
ELECTRIC BATTERIES
First International Workshop on Battery Testing, 30 September-2 October 1985, Heidelberg, FRG
[DE86-004058] N86-30080
ELECTRIC CHARGE
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895
A new instrument to measure charged and neutral cometary dust particles at low and high impact velocities
N86-30590
ELECTRIC CONTACTS
Structure and electrical properties of Au contacts to GaAs
[DE86-007499] N86-30550
ELECTRIC CONTROL
Control of windpowered station with variable speed; small range
[FOA-C-20600-E3] N86-30261
ELECTRIC CURRENT
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895
A 1000 amp ac/dc current source for the calibration of welding systems
[DE86-004924] N86-30211
ELECTRIC FIELD STRENGTH
Fundamental relativistic solution for the railgun
[AD-A166607] N86-30487
ELECTRIC FIELDS
Biological studies of swine exposed to 60-Hz electric fields. Volume 5: Hematology and serum chemistry
[DE86-005362] N86-30344
Biological studies of swine exposed to 60-Hz electric fields. Volume 6: Immunology
[DE86-005363] N86-30345
Effects of 60 Hz electric field on operant and social stress behaviors of nonhuman primates
[DE85-016121] N86-30346
Effects of 60 Hz electric fields on operant and social stress behaviors of nonhuman primates
[DE86-005807] N86-30347
Two dimensional analytical considerations of large magnetic and electric fields in laser produced plasmas
[DE86-00235] N86-30512
ELECTRIC GENERATORS
Development of Stirling engine in FY 1984
[DE86-900207] N86-30217
ELECTRIC POTENTIAL
Effects of 60 Hz electric field on operant and social stress behaviors of nonhuman primates
[DE85-016121] N86-30346
Two dimensional analytical considerations of large magnetic and electric fields in laser produced plasmas
[DE86-00235] N86-30512
ELECTRIC POWER PLANTS
Records, documentation storage and retrieval system, phase 2
[DE86-007219] N86-30577
ELECTRICAL MEASUREMENT
Study of test methods for urethane elastomers
[AD-A166293] N86-29992
Submerged arc welding control via arc sensing
[AD-A166320] N86-30207
ELECTRICAL PROPERTIES
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166242] N86-30524
Superconductivity of thin film intermetallic compounds
[AD-A166271] N86-30525
Effects of 500 keV electron irradiation and subsequent annealing on 1/f noise in copper films
[DE86-002954] N86-30540
Structure and electrical properties of Au contacts to GaAs
[DE86-007499] N86-30550
ELECTRICAL RESISTIVITY
Resistive instabilities in tokamaks
[DE86-002538] N86-30510
ELECTRIFICATION
The electrification of spacecraft
[NASA-TM-77653] N86-29866
ELECTRO-OPTICS
Electronics Division research and development
[DE86-008327] N86-30083
Organization of the channel-switching process in parallel computer systems based on a matrix optical switch
[NASA-TM-88452] N86-30406
Ferroelectric tungsten bronze crystals for far infrared electro-optic device applications
[AD-A166484] N86-30531
ELECTROCARDIOGRAPHY
Continuous ECG monitoring of Mirage 2000 pilots (comparison with Mirage 3 and F1 pilots) N86-30315
ELECTROCHEMICAL CELLS
First International Workshop on Battery Testing, 30 September-2 October 1985, Heidelberg, FRG
[DE86-004058] N86-30080
ELECTROCHEMISTRY
X-ray studies of the solid-electrolyte interface
[DE86-003639] N86-29943
Electrochemical photocapacitance spectroscopy of amorphous silicon alloy materials
[DE86-004421] N86-30546
ELECTRODEPOSITION
Electrode kinetic measurements of very fast reactions: Metal deposition-dissolution in molten halides
[DE86-006109] N86-29945
ELECTRODES
Production of an ion-exchange membrane-catalytic electrode bonded material for electrolytic cells
[NASA-TM-88392] N86-29930
Determination of relative sensitivity factors for use in spark-source mass spectrometry
[DE86-700715] N86-29942
Electrode kinetic measurements of very fast reactions: Metal deposition-dissolution in molten halides
[DE86-006109] N86-29945
ELECTROJETS
Longitudinal difference in the Sq profiles in the South American region
[INPE-3944-PRE/966] N86-30271
ELECTROLYTIC CELLS
Production of an ion-exchange membrane-catalytic electrode bonded material for electrolytic cells
[NASA-TM-88392] N86-29930
ELECTROMAGNETIC ABSORPTION
Scattering and absorption of light due to surface resonances on submicron oblate spheroidal particulates
[DE86-005261] N86-30500
Radial distribution of excited atoms in a plasma column produced by a surface wave
[LP-214] N86-30513
ELECTROMAGNETIC COMPATIBILITY
Data transmission by radar --- jamming resistance
[REPT-8-85] N86-30032
ELECTROMAGNETIC FIELDS
Study of new flight test techniques
[NASA-CR-176952] N86-29812

Electromagnetic fields in 3-D for various cavity antennas and Faraday shields
[DE86-007563] N86-30054
Field calculations of axisymmetric current coils in vacuum
[ESA-86-97547] N86-30058
The magnetic effects of shallow water internal solitons
[AD-A165852] N86-30297

ELECTROMAGNETIC MEASUREMENT
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166274] N86-30527

ELECTROMAGNETIC PROPERTIES
The magnetic effects of shallow water internal solitons
[AD-A165852] N86-30297

ELECTROMAGNETIC PULSES
A fast high power light pulse generator — flash photography
[MPIS-18/1985] N86-30085
Electron-ion recombination in air at EMP fields
[AD-A166211] N86-30486
Nonlinear temporal modulation of pulsar radioemission
[DE86-700670] N86-30626

ELECTROMAGNETIC PUMPS
Nonlinear theory of the free-electron laser
[DE86-700668] N86-30146

ELECTROMAGNETIC RADIATION
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292
Theoretical study of the radiative and kinetic properties of selected metal oxides and air molecules
[AD-A166113] N86-30521
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166274] N86-30527

ELECTROMAGNETIC SPECTRA
The influence of negative ions on the incoherent diffusion of electromagnetic waves in the D region of the ionosphere
[AERONOMICA-ACTA-A-302-1985] N86-30269

ELECTROMAGNETIC SURFACE WAVES
Radial distribution of excited atoms in a plasma column produced by a surface wave
[LP-214] N86-30513
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166242] N86-30524

ELECTRON ACCELERATORS
High average power induction accelerators
[DE86-005288] N86-30488

ELECTRON AFFINITY
Benchmark full configuration-interaction calculations on H2O, F- and F N86-30375
On the electron affinity of the oxygen atom N86-30377

ELECTRON BEAMS
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895
Pulsed chemical laser technology development test plan single pulse diagnostic testing
[AD-A166203] N86-30140
Electron-ion recombination in air at EMP fields
[AD-A166211] N86-30486
In situ high voltage electron microscope studies of ion- and electron-beam induced modification of materials
[DE86-005577] N86-30491

ELECTRON DENSITY (CONCENTRATION)
Experimental study of chemical alleviation for improving reentry communication
[AD-A165862] N86-30042
Theory and analysis of soft X-ray laser experiments
[DE86-005177] N86-30148
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292
Stimulated Raman scattering: Comparison of theory and experiment
[DE86-006480] N86-30501
Theory of electronic states in disordered alloy hydrides
[DE86-006260] N86-30539

ELECTRON DENSITY PROFILES
An investigation of diacharge structures in the submillimeter band in an MHD generator
[VDF-NT-84-16] N86-30516

ELECTRON DIFFRACTION
Structural characterizaiton and gas reactions of small metal particles by high-resolution, in-situ TEM and TED
[NASA-CR-176905] N86-29958
Structural characterization and gas reactions of small metal particles by high-resolution TEM and TED
[NASA-CR-176949] N86-29959

ELECTRON EMISSION
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895

ELECTRON ENERGY
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292
Stimulated Raman scattering: Comparison of theory and experiment
[DE86-006480] N86-30501
Theoretical study of the radiative and kinetic properties of selected metal oxides and air molecules
[AD-A166113] N86-30521

ELECTRON IRRADIATION
Structural characterization and gas reactions of small metal particles by high-resolution TEM and TED
[NASA-CR-176949] N86-29959
Effects of 500 keV electron irradiation and subsequent annealing on 1/f noise in copper films
[DE86-002954] N86-30540

ELECTRON MICROSCOPES
Structural characterizaiton and gas reactions of small metal particles by high-resolution, in-situ TEM and TED
[NASA-CR-176905] N86-29958
In situ high voltage electron microscope studies of ion- and electron-beam induced modification of materials
[DE86-005577] N86-30491

ELECTRON MICROSCOPY
Structural characterizaiton and gas reactions of small metal particles by high-resolution, in-situ TEM and TED
[NASA-CR-176905] N86-29958
Structural characterization and gas reactions of small metal particles by high-resolution TEM and TED
[NASA-CR-176949] N86-29959
In situ high voltage electron microscope studies of ion- and electron-beam induced modification of materials
[DE86-005577] N86-30491
Contributions of electron microscopy to the understanding of reactions on compound semiconductor surfaces
[DE86-005230] N86-30533
Topics in precipitation and ordering reactions and their related phenomena
[DE86-007483] N86-30549

ELECTRON MOBILITY
Microstructure effects on ion and electron transport parameters during passive corrosion of zircaloy
[DE86-007189] N86-29979

ELECTRON ORBITALS
Graph theory in the study of metal cluster bponding topology: Applications to metal clusters having fused polyhedra
[AD-A166623] N86-29937
Theoretical research program to study transition metal trimers and embedded clusters
[NASA-CR-176948] N86-29960

ELECTRON PARAMAGNETIC RESONANCE
High pressure electron resonance studies of electronic, magnetic and structural phase transitions
[DE85-016971] N86-30544

ELECTRON PUMPING
Studies on radiative collisional and ultraviolet lasers
[AD-A166193] N86-30139
Measurement of population inversions and gain in carbon fiber plasmas
[DE86-002532] N86-30508

ELECTRON STATES
On the low-lying states of CuO N86-29928
Dependence of bond strength of layers on energy state of contact surfaces during cladding of bimetals
[BLL-M-36769-(5828.4)] N86-29955
On the electron affinity of the oxygen atom N86-30377
Theoretical study of the radiative and kinetic properties of selected metal oxides and air molecules
[AD-A166113] N86-30521
Superconducting electronic film structures
[AD-A166183] N86-30522
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166274] N86-30527
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166290] N86-30528

ELECTRON TRANSFER
Microstructure effects on ion and electron transport parameters during passive corrosion of zircaloy
[DE86-007189] N86-29979

ELECTRON TRANSITIONS
Critical review of gamma-ray laser proposals
[DE86-006020] N86-30144
Theoretical study of the radiative and kinetic properties of selected metal oxides and air molecules
[AD-A166113] N86-30521

ELECTRON-ION RECOMBINATION
Electron-ion recombination in air at EMP fields
[AD-A166211] N86-30486

ELECTRONIC CONTROL
Adaptive control system. Volume 1. Equipment and testing
[AD-A166036] N86-30074

ELECTRONIC MAIL
TOFACS (Technical Office Automation and Communication System) software development and enhancements for fiscal year 1983 - fiscal year 1985
[AD-A166563] N86-30352

ELECTRONIC SPECTRA
Electronic spectra of various liquids under shock conditions
[AD-A166510] N86-29936

ELECTRONIC WARFARE
A collection of Area of Interest (AOI) algorithms
[NASA-CR-176984] N86-30404

ELECTRONS
Theoretical research program to study transition metal trimers and embedded clusters
[NASA-CR-176948] N86-29960

ELECTROSTATIC PROBES
Design and fabrication of an actively cooled Langmuir probe for long pulse applications
[DE86-005231] N86-30507

ELECTROSTATIC SHIELDING
Electromagnetic fields in 3-D for various cavity antennas and Faraday shields
[DE86-007563] N86-30054

ELLIPSOMETERS
Acta Optica Sinica (selected articles)
[AD-A166281] N86-30495

EMERGENCIES
Task Force report on emergency evacuation of transport airplanes, volume 1
[DOT/FAA/VS-86/1.1] N86-29793
Task force report on emergency evacuation of transport airplanes. Volume 2: Supporting documentation
[FAA/VS-86/1,2] N86-29797

EMISSION SPECTRA
Laser induced fluorescence of FCO radicals in the gas phase
[MPIS-17/1985] N86-29950

ENERGY CONSUMPTION
Macromodeling and optimization of digital MOS VLSI circuits
[AD-A166658] N86-30075

ENERGY CONVERSION
Proceedings of the Ninth DOE Solar Photochemistry Research Conference
[DE86-006167] N86-30252

ENERGY CONVERSION EFFICIENCY
Background review on compressors for gas engine-driven heat pumps
[PB86-201175] N86-30220

ENERGY DISSIPATION
Turbulent heating and transfer in the stratosphere and lower mesosphere
[AD-A166591] N86-30276

ENERGY GAPS (SOLID STATE)
Spin-coated amorphous chalcogenide resists spin-coated amorphous chalcogenide glasses
[AD-A166270] N86-29991
Semiconducting transition metal silicides for electro-optic VSLI interconnects
[AD-A165895] N86-30519

ENERGY LEVELS
Charge accumulation and arc discharges on spacecraft materials and components
[AD-A166216] N86-29893
Dependence of bond strength of layers on energy state of contact surfaces during cladding of bimetals
[BLL-M-36769-(5828.4)] N86-29955
Nuclear structure properties for gamma-ray lasers
[DE86-006027] N86-30150
Measurement of population inversions and gain in carbon fiber plasmas
[DE86-002532] N86-30508
Electrochemical photocapacitance spectroscopy of amorphous silicon alloy materials
[DE86-004421] N86-30548

ENERGY POLICY
Simplified examinations of the aerodynamic performances of tip vane rotors
[NLR-M-AT-84-007-L] N86-29787
Estimate of the aerodynamic performances of tip vane rotors using the Helix program
[NLR-TR-85027-L] N86-29788
Aerodynamic research on tip vane rotors, carried out by NLR, and a rough evaluation of the tip vane concept
[NLR-TR-85064-L] N86-29789

ENERGY SPECTRA
Nonlinear effects in long range underwater acoustic propagation
[AD-A166492] N86-30472
ENERGY TECHNOLOGY
Japan report: Science and technology
[JPRS-JST-86-011] N86-30086
International Workshop on Two-Phase Flow Fundamentals
[DE86-006548] N86-30112
Energy Sciences Advanced Computation program plan
[DE86-006958] N86-30391
ENERGY TRANSFER
Pulsed chemical laser technology development test plan single pulse diagnostic testing
[AD-A166203] N86-30140
Laser studies of halogens and oxygen
[AD-A156257] N86-30477
ENGINE CONTROL
Control research in windpower project 506259-1 control FOA, stage 1
[FOA-C-20601-E3] N86-30262
ENGINE FAILURE
National Transportation Safety Board safety recommendation
[NTSB-4360/33] N86-29791
ENGINE INLETS
Theory and experimental study of a 3-D jet introduced into the secondary flow of a turbine inlet guide vane
N86-29860
ENGINE NOISE
Noise predictions of a high bypass turbofan engine using the Lockheed Near-Field Noise Prediction Program
[NASA-CR-178146] N86-30469
ENGINE PARTS
Automotive Stirling engine development program
[NASA-CR-175045] N86-30579
ENGINE TESTS
Engine tests on a cooled gas turbine stage
N86-29836
Combustion in IC engines
[DE86-007846] N86-29947
Automotive Stirling engine development program
[NASA-CR-175045] N86-30579
ENGINEERING MANAGEMENT
Proceedings of the 4th DOE Workshop on Computer Aided Engineering
[DE86-006129] N86-30386
ENGINES
Development of Stirling engine in FY 1984
[DE86-900207] N86-30217
Institutional supporting research and development, 1985
[DE86-006580] N86-30583
ENTROPY
An entropy correction method for unsteady full potential flows with strong shocks
[NASA-TM-87769] N86-29777
Tail behavior for the suprema of Gaussian processes with a view towards empirical processes
[AD-A166151] N86-30461
ENTROPY (STATISTICS)
Multichannel relative-entropy spectrum analysis
[AD-A166625] N86-30046
ENVIRONMENT EFFECTS
Direct effects of increasing carbon dioxide on vegetation
[DE86-007397] N86-30267
EPITAXY
Gallium arsenide and multibandgap solar cell research
[DE85-016894] N86-30256
Superconducting electronic film structures
[AD-A166183] N86-30522
EPOXY COMPOUNDS
Particles and gases produced by cutting fiber composites with a 250 W continuous wave carbon dioxide laser
[FOA-C-20599-D6] N86-29918
UV cured epoxide coating
[DE86-003728] N86-30001
EPOXY MATRIX COMPOSITES
Aging of carbon-epoxy composite in humid environments
[PV-42-791/F] N86-29921
Determination of the basic parameters in the micromechanical behavior of composite materials
[ONERA-RT-41/7086-M] N86-29922
EPOXY RESINS
Differences in interfacial bond strengths of graphite fiber-epoxy resin composites
[NASA-CR-176912] N86-29905
Material properties of epoxy resins reinforced with carbon fibers, affected by heat radiation
[FOA-C-20597-F9] N86-29917
General investigations of composite materials. Adhesive bonding of carbon composites — carbon fibers
[SNIAS-2647/DCI-PR/85] N86-29919
EQUATIONS OF MOTION
Flap-lag-torsional dynamics of helicopter rotor blades in forward flight
[NASA-CR-176976] N86-29810
Model-following control for an oblique-wing aircraft
[NASA-TM-88269] N86-29867
Considerations about the apparent superluminal expansions in astrophysics
[DE86-701328] N86-30613
EQUATIONS OF STATE
One-component plasma model and large Z laboratory plasmas
[AD-A166606] N86-30506
Astrophysical materials science: Theory
[NASA-CR-177021] N86-30610
EQUATORIAL ORBITS
A description of prediction errors associated with the T-Sus-4 navigation message and a corrective procedure
[NOAA-TM-NESDIS-16] N86-29875
EQUATORS
Longitudinal difference in the Sq profiles in the South American region
[INPE-3944-PRE/986] N86-30271
EQUILIBRIUM
Fugacity and concentration gradients in a gravity field
[NASA-TM-88809] N86-30620
EQUILIBRIUM EQUATIONS
Multigrid method for the equilibrium equations of elasticity using a compact scheme
[NASA-CR-178120] N86-30420
EQUIPMENT SPECIFICATIONS
Study of new flight test techniques
[NASA-CR-176952] N86-29812
Computations and turbulent flow modeling in support of helicopter rotor technology
[NASA-CR-177095] N86-30090
Optical diagnostics of gas-dynamic flows using advanced laser measurement techniques
[NASA-CR-176950] N86-30095
Effects of simulated weightlessness on meiosis. Fertilization, and early development in mice
[NASA-CR-177106] N86-30342
EROSION
Study of surfaces and surface layers on high temperature materials after short-time thermal loads — tokamaks
[JUEL-2024] N86-30514
ERROR ANALYSIS
Potentials of large format camera photography
[AD-A166079] N86-30126
An experimental evaluation of error seeding as a program validation technique N86-30362
ERROR CORRECTING CODES
Coding for reliable satellite communications
[NASA-CR-177262] N86-30035
Weighted decoding of block linear codes
[ENST-86E001] N86-30395
ERROR DETECTION CODES
Coding for reliable satellite communications
[NASA-CR-177262] N86-30035
On-line design rule checker — (V)LSI chips
[ESA-86-97529] N86-30403
ERROR FUNCTIONS
Exponential bounds of mean error for the nearest neighbor estimates of regression functions
[AD-A166156] N86-30450
ERRORS
Data transmission systems circuits and exchange parameters on the C3 interface in the case of the parallel input-output of discrete information
[AD-A166206] N86-30044
Exponential bounds of mean error for the nearest neighbor estimates of regression functions
[AD-A166156] N86-30450
ESCAPE ROCKETS
Vectored thrust digital flight control for crew escape, volume 2
[AD-A166596] N86-29795
ESCHERICHIA
Bacterial inactivation by means of ionizing radiation
[DE86-901038] N86-30348
ESTIMATES
Exponential bounds of mean error for the nearest neighbor estimates of regression functions
[AD-A166156] N86-30450
Computational efficiency study of a semi-analytical technique for the angular integral estimation found in transfer matrix generation
[DE86-700784] N86-30462
ESTIMATING
On realizations of least-squares estimation and Kalman filtering by systolic arrays N86-30072
Development of accurate estimation methods for calculating heat capacities of refractory materials
[DE86-004242] N86-30559
EULER EQUATIONS OF MOTION
A minimum entropy principle in the gas dynamics equations
[NASA-CR-178123] N86-30421
EUROPEAN SPACE PROGRAMS
The ESA C-band wind scatterometer campaign: Preliminary campaign definition
[ESA-86-97552] N86-30080
The ESA C-band wind scatterometer campaign: Data processing
[ESA-86-97555] N86-30081
EUTECTICS
Electrode kinetic measurements of very fast reactions: Metal deposition-dissolution in molten halides
[DE86-006109] N86-29945
Experimental study of electronic states at metal-dielectric interfaces
[AD-A168242] N86-30524
EVALUATION
Aerodynamic research on tip vane rotors, carried out by NLR, and a rough evaluation of the tip vane concept
[NLR-TR-85064-L] N86-29789
EVOKED RESPONSE (PSYCHOPHYSIOLOGY)
An investigation of the use of steady-state evoked potentials for human performance and workload assessment and control
[AD-A166205] N86-30332
EVOLUTION (DEVELOPMENT)
Proceedings of the MECA Workshop on The Evolution of the Martian Atmosphere
[NASA-CR-176899] N86-30814
EXCIMERS
Studies on radiative collisional and ultraviolet laser
[AD-A166193] N86-30139
EXCITATION
Desirable excitation patterns for tapered wigglers
[DE86-005997] N86-30149
EXHAUST GASES
Rocket exhaust probe
[AD-D012224] N86-30132
EXOTHERMIC REACTIONS
Molecular dynamics of reactions forming electronically excited products
[AD-A166168] N86-29931
EXPERIMENT DESIGN
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] N86-30233
EXPERIMENTATION
Studies and experiments in the Software Engineering Lab (SEL) N86-30359
EXPERT SYSTEMS
Study of onboard expert systems to augment space shuttle and space station autonomy
[NASA-CR-176958] N86-29886
The development of ALADIN (Aluminum alloy design inventor), an expert system for aluminum alloy design
[AD-A166278] N86-29985
DEASEL: An expert system for software engineering
N86-30361
Report on the AI trip
[IR-82] N86-30397
Overview of ROME: A reason-Oriented Modeling Environment
[AD-A166259] N86-30411
The role of databases in knowledge-based systems
[AD-A166365] N86-30573
EXPLOSIONS
Cryogenic explosion environment modeling and testing of space shuttle and light-weight radioisotope heater unit interactions
[DE86-005901] N86-29861
EXPLOSIVES
Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025
Comparison of extraction techniques and solvents for explosive residues in soil
[AD-A168474] N86-30026
Eighth Symposium (International) on Detonation, volume 3
[DE86-006795] N86-30028
Database assessment of pollution control in the military explosives and propellants production industry
[AD-A165653] N86-30264
EXPONENTIAL FUNCTIONS
Mathematical and statistical characterizations of generalized hyperexponential distribution functions
[AD-A165892] N86-30448
Exponential bounds of mean error for the nearest neighbor estimates of regression functions
[AD-A166156] N86-30450

EXPOSURE
Biological studies of swine exposed to 60-Hz electric fields. Volume 6: Immunology
[DE86-005363] N86-30345
EXTERNAL STORES
Flight test of a decoupler pylon for wing/store flutter suppression
[NASA-TM-87767] N86-29814

F

F REGION
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292
F-14 AIRCRAFT
Visual capabilities related to fighter aircrew performance in the F-14 and adversary aircraft N86-30320
F-16 AIRCRAFT
Systematic radiographic examination of the spine for selection of F-16 pilots: A preliminary report
N86-30323
Treadmill spiroergometry in the selection and screening of high-performance combat aircraft pilots in the Belgian Air Force N86-30325
F-18 AIRCRAFT
An investigation of empennage buffeting
[NASA-CR-176973] N86-29864
F-106 AIRCRAFT
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] N86-30233
FABRICATION
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] N86-29815
Outgassing measurement of the aluminum alloy UHV chamber
[NASA-TM-88433] N86-29962
Microalloyed nickel-3/aluminum, a new medium temperature alloy
[DE86-006227] N86-29975
Hollow droplet generator for polymer shell production
[DE86-006462] N86-29999
Double-injection, deep-impurity switch development
[NASA-CR-174936] N86-30073
Evaluation of selected detector arrays for space applications
[NASA-CR-176979] N86-30124
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129
Instrumentation for surface studies for novel electronics processing
[AD-A166093] N86-30520
FACTORIZATION
An entropy correction method for unsteady full potential flows with strong shocks
[NASA-TM-87769] N86-29777
FAILURE ANALYSIS
Determination of the basic parameters in the micromechanical behavior of composite materials
[ONERA-RT-41/7086-M] N86-29922
HYTESS 2: A Hypothetical Turbofan Engine Simplified Simulation with multivariable control and sensor analytical redundancy
[NASA-TM-87344] N86-30068
Application of systems analysis techniques to vulnerability studies of complex installations
[DE86-006012] N86-30223
Failure analysis and microcrack dependent discontinuum mechanics
[DE86-006710] N86-30240
FAILURE MODES
Failure propagation in continuum models of LSS (Large Space Structures), part 1
[AD-A166208] N86-29892
Failure control techniques for the SSME, phase 1
[NASA-CR-178845] N86-29900
FAN BLADES
National Transportation Safety Board safety recommendation
[NTSB-4360/33] N86-29791
FAR INFRARED RADIATION
Dither-free stabilization of CO2 lasers for far infrared pumping: A photoacoustic approach
[DE86-007078] N86-30154
FAR ULTRAVIOLET RADIATION
Studies on radiative collisional and ultraviolet lasers
[AD-A166193] N86-30139
FAST FOURIER TRANSFORMATIONS
An efficient method for solving quantum Liouville equation: Applications to electronic absorption spectroscopy
[AD-A166260] N86-29935
FATIGUE (BIOLOGY)
An investigation of the use of steady-state evoked potentials for human performance and workload assessment and control
[AD-A166205] N86-30332
FATIGUE (MATERIALS)
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A166466] N86-29968
FATIGUE LIFE
Wind turbine fatigue considerations
[DE86-006499] N86-30257
FATIGUE TESTING MACHINES
Fatigue test machine
[AD-D012232] N86-30133
FATIGUE TESTS
Adaptive control system. Volume 1. Equipment and testing
[AD-A166036] N86-30074
FAULT TOLERANCE
Application of artificial intelligence techniques to fault diagnosis for printed circuits
[ENST-85E011] N86-30413
ASSIST: User's manual
[NASA-TM-87735] N86-30447
FEASIBILITY ANALYSIS
Estimate of the aerodynamic performances of tip vane rotors using the Helix program
[NLR-TR-85027-L] N86-29788
Aerodynamic research on tip vane rotors, carried out by NLR, and a rough evaluation of the tip vane concept
[NLR-TR-85064-L] N86-29789
FEEDBACK CIRCUITS
Pointing alignment by orthogonal phase-lock feedback loops
[DE86-006707] N86-30082
FEEDBACK CONTROL
Multi-variable control of the GE T700 engine using the LQG/LTR design methodology
[NASA-CR-177080] N86-29819
A canonical form for nonlinear systems
[NASA-CR-176974] N86-30371
FERRATES
Investigation of alternative MCFC cathode materials at Argonne National Laboratory
[DE86-005576] N86-30081
FERROELECTRICITY
Ferroelectric tungsten bronze crystals for far infrared electro-optic device applications
[AD-A166484] N86-30531
FERTILIZATION
Effects of simulated weightlessness on meiosis. Fertilization, and early development in mice
[NASA-CR-177106] N86-30342
FERTILIZERS
Direct effects of increasing carbon dioxide on vegetation
[DE86-007397] N86-30267
FETUSES
Biological studies of swine exposed to 60-Hz electric fields. Volume 6: Immunology
[DE86-005363] N86-30345
FIBER COMPOSITES
Improvement and optimization of internal damping of fiber reinforced composite materials
[AD-A166173] N86-29909
FIBER OPTICS
Worldwide report: Telecommunications policy, research, and development
[JPRS-TTP-86-013] N86-29897
Worldwide report: Telecommunications policy, research and development
[JPRS-TTP-86-011] N86-30064
Development of China's fiber optic technology discussed N86-30066
Fiber optic rotary switching device
[AD-D012231] N86-30499
Fiber optical data link extension for the IEC-625 interface bus
[ESA-86-97532] N86-30505
FIBER REINFORCED COMPOSITES
Improvement and optimization of internal damping of fiber reinforced composite materials
[AD-A166173] N86-29909
Nondestructive evaluation of metal matrix composites
[AD-A166774] N86-29911
FIBERS
Differences in interfacial bond strengths of graphite fiber-epoxy resin composites
[NASA-CR-176912] N86-29905
A modified microbonding test for direct in-situ fiber/matrix bond strength determination in fiber composites
[MIT-RR-R84-3] N86-29906
Experiments and micromechanical models for creep-rupture in polymer matrix composites
[DE86-007980] N86-29916
Particles and gases produced by cutting fiber composites with a 250 W continuous wave carbon dioxide laser
[FOA-C-20599-D6] N86-29918
FIELD EFFECT TRANSISTORS
Monolithic low noise amplifier with limiting --- application to Global Positioning System receivers
[AD-D012225] N86-30076
Development of optimized detector/spectrophotometer technology for low background space astronomy missions
[NASA-CR-177142] N86-30609
FIGHTER AIRCRAFT
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] N86-29764
Vectored thrust digital flight control for crew escape, volume 1
[AD-A166580] N86-29798
Vectored thrust digital flight control for crew escape, volume 2
[AD-A166596] N86-29799
Medical Selection and Physiological Training of Future Fighter Aircrew
[AGARD-CP-396] N86-30309
Aircrew aspects of United Stated future fighter aircraft
N86-30310
Medical selection and physiological training of fighter pilots: A 1985 perspective and overview N86-30312
Selection and medical testing of Mirage 2000 pilots: Report of echocardiography N86-30314
Continuous ECG monitoring of Mirage 2000 pilots (comparison with Mirage 3 and F1 pilots) N86-30315
Entry visual standards and ocular examination techniques for future fighter aircrew N86-30317
Computer analysis of visual and vestibular oculomotor function in the medical selection of fighter aircrew members N86-30319
Vision test battery threshold and response time as predictors of air-to-air visual target acquisition in F-14 and adversary aircraft N86-30321
The vertebral column: Selection and aptitude of combat aircraft pilots of the future N86-30322
Relationship of cardiopulmonary fitness to flight performance in tactical aviation N86-30326
FILAMENT WINDING
Tension strength of a thick graphite/epoxy laminate after impact by a 1/2-in. radius impactor
[NASA-TM-87771] N86-29907
A viscoelastic-damage simulation model for filament-wound pressure vessels
[AD-A166389] N86-30208
FILE MAINTENANCE (COMPUTERS)
A fast, tree-based access method --- file maintenance
[IR-85] N86-30439
Records, documentation storage and retrieval system, phase 2
[DE86-007219] N86-30577
FILM COOLING
Heat Transfer and Cooling in Gas Turbines
[AGARD-CP-390] N86-29823
Cooling techniques for gas turbine airfoils: A survey
N86-29824
Effects of hole geometry, wall curvature and pressure gradient on film cooling downstream of a single row --- gas turbine cooling N86-29831
The effect of density ratio on the film-cooling of a flat plate N86-29833
Studies of heat transfer on the base of turbine nozzles with and without film cooling N86-29834
Engine tests on a cooled gas turbine stage
N86-29836
A model for correlating flat plate film cooling effectiveness for rows of round holes N86-29840
Effectiveness measurements for a cooling film disrupted by a single jet with wall plunging N86-29844
Alternate cooling configurations for gas turbine combustion systems N86-29845
Effect of film cooling on the aerodynamic performance of a turbine cascade N86-29859
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades N86-29861
The boundary layer behaviour of an advanced gas turbine rotor blade under the influence of simulated film cooling N86-29862
FINANCE
Small Business Innovation Research. Abstracts of Phase 2 awards, 1985
[DE86-005392] N86-30567

FINE STRUCTURE
Orientation effects and fine structure transitions in differential scattering cross sections
[MPIS-15/1985] N86-30481
FINES
Olefin polymers as jet fuel antimist additives
N86-30016
FINITE DIFFERENCE THEORY
Calculation of laminar-turbulent boundary layer transition on turbine blades N86-29839
Two-dimensional flux-corrected transport solver for convectively dominated flows
[DE86-005329] N86-30106
Evidence of nonuniqueness and oscillatory solutions in computational fluid mechanics
[DE86-006493] N86-30111
Preliminary investigation of a calculus of functional differences: Fixed differences
[AD-A165879] N86-30429
FINITE ELEMENT METHOD
Investigation of surface strains in fir tree turbine blade attachments
[AD-A166330] N86-29821
Effects of wakes on the heat transfer in gas turbine cascades N86-29829
A modified microbonding test for direct in-situ fiber/matrix bond strength determination in fiber composites
[MIT-RR-R84-3] N86-29906
Investigations of creep cavitation in type 304 stainless steel
[DE86-007187] N86-29978
Navier-Stokes equations by the finite element method
[DE86-700661] N86-30108
Finite-element model in vorticity and current function for the numerical solution of the Navier-Stokes equations
[DE86-700787] N86-30109
Evidence of nonuniqueness and oscillatory solutions in computational fluid mechanics
[DE86-006493] N86-30111
Modeling of elastically mounted vertical rotor
N86-30168
Shared memory, cache, and frontwidth considerations in multifrontal algorithm development
[DE86-007245] N86-30393
FIRE EXTINGUISHERS
Halon extinguisher agent behavior in a ventilated small aircraft
[DOT/FAA/CT-86/5] N86-29794
FIRE FIGHTING
Halon extinguisher agent behavior in a ventilated small aircraft

FLIGHT CONTROL
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-88265] N86-29813
Experience with synchronous and asynchronous digital control systems
[NASA-TM-88271] N86-29866
Model-following control for an oblique-wing aircraft
[NASA-TM-88269] N86-29867
Introduction to robust multivariable control
[AD-A165891] N86-29869
Aircrew aspects of United Stated future fighter aircraft
N86-30310
FLIGHT CREWS
Aircrew aspects of United Stated future fighter aircraft
N86-30310
Canadian forces approach to aircrew medical selection N86-30311
Computer analysis of visual and vestibular oculomotor function in the medical selection of fighter aircrew members N86-30319
Visual capabilities related to fighter aircrew performance in the F-14 and adversary aircraft N86-30320
Hypobaric training of flight personnel without compromising quality of life N86-30327
Attention tasks and their relation to aging and flight experience
[IZF-1986-4] N86-30337
FLIGHT FITNESS
Canadian forces approach to aircrew medical selection N86-30311
FLIGHT HAZARDS
Investigation of hazards of helicopter operations and root causes of helicopter accidents
[FAA/PM-86/28] N86-29796
FLIGHT RULES
The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways
[AD-A166485] N86-29804
FLIGHT SAFETY
Experience with synchronous and asynchronous digital control systems
[NASA-TM-88271] N86-29866
FLIGHT SIMULATION
Development of an algorithm to model an aircraft equipped with a generic CDTI display
[NASA-TM-87732] N86-30349
FLIGHT TESTS
Technology research for strapdown inertial experiment and digital flight control and guidance
[NASA-CR-176907] N86-29800
Engineering performance evaluation of small community airport microwave landing system (TI-model) at Philadelphia International Airport Runway 17
[FAA/PM-86/24] N86-29802
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-88265] N86-29813
Flight test of a decoupler pylon for wing/store flutter suppression
[NASA-TM-87767] N86-29814
Analogue signal conditioning for flight test instrumentation
[AGARD-AG-160-VOL-17] N86-29816
Flight determination of the aerodynamic stability and control characteristics of the NASA SGS 1-36 sailplane in the conventional and deep stall angles-of-attack of between -5 and 75 degrees
[NASA-CR-176962] N86-29865
A radar data processing and enhancement system
[NASA-TM-88274] N86-29884
Noise predictions of a high bypass turbofan engine using the Lockheed Near-Field Noise Prediction Program
[NASA-CR-178146] N86-30489
FLIGHT TRAINING
Cardiovascular standards for selection and retention of high performance pilots in the USAF: Perspectives for the next decade N86-30313
FLIP-FLOPS
Advanced laser based inertial instrument development
[AD-A166307] N86-30128
FLOOD PREDICTIONS
Forecasting current velocity on routine basis — flood control
[PUBL-345] N86-30254
FLOQUET THEOREM
Flap-lag-torsional dynamics of helicopter rotor blades in forward flight
[NASA-CR-176976] N86-29810
FLOW CHARACTERISTICS
Effect of Reynolds Number and Mach Number on flow angularity probe sensitivity
[NASA-TM-87750] N86-29774
Calculation of laminar-turbulent boundary layer transition on turbine blades N86-29839
Simulation of flow and heat transfer in annular cavities between disks in turbomachinery N86-29855
Effect of film cooling on the aerodynamic performance of a turbine cascade N86-29859
Theory and experimental study of a 3-D jet introduced into the secondary flow of a turbine inlet guide vane
N86-29860
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades N86-29861
Structural dynamics and fluid flow in shell-and-tube heat exchangers. Summary and overview of a DOE/ECUT-sponsored research program
[DE86-007798] N86-30114
FLOW DISTRIBUTION
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] N86-29772
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] N86-29782
Comparisons of CFD flow field solutions with experimental data at Mach 14
[DE86-004915] N86-29784
Wake-passing in a turbine rotor cascade N86-29830
Experimental study of chemical alleviation for improving reentry communication
[AD-A165862] N86-30042
Numerical simulation of the flowfield over ice accretion shapes
[NASA-CR-176960] N86-30093
Two-dimensional flux-corrected transport solver for convectively dominated flows
[DE86-005329] N86-30106
Modeling of flow fields in oscillating droplets
[DE86-008232] N86-30119
FLOW EQUATIONS
NASA-VOF2D: a computer program for incompressible flows with free surfaces
[DE86-007195] N86-30116
FLOW GEOMETRY
Convective heat transfer from circular cylinders located within perforated cylindrical shrouds
[NASA-CR-4005] N86-30100
FLOW MEASUREMENT
Two spot laser velocimeter measurements of velocity and turbulence intensity in shock tube driven turbine flows N86-29853
A 3-component laser-Doppler velocimeter data acquisition and reduction system
[NASA-CR-176929] N86-30135

FLOW VELOCITY
Two spot laser velocimeter measurements of velocity and turbulence intensity in shock tube driven turbine flows N86-29853
Pressure drop in flashing flow through obstructions [DE86-007152] N86-30113
Computation of dense spray jets [DE86-008176] N86-30118
A 3-component laser-Doppler velocimeter data acquisition and reduction system [NASA-CR-176929] N86-30135
Bearing tester data compilation analysis, and reporting and bearing math modeling [NASA-CR-176909] N86-30205
Forecasting current velocity on routine basis --- flood control [PUBL-345] N86-30284
FLOW VISUALIZATION
Wake-passing in a turbine rotor cascade N86-29830
Modeling of flow fields in oscillating droplets [DE86-008232] N86-30119
FLUID DYNAMICS
Optical diagnostics of gas-dynamic flows using advanced laser measurement techniques [NASA-CR-176950] N86-30095
Two-phase flows within systems with ambient pressure N86-30167
FLUID FILMS
Measuring dynamic oil film coefficients of sliding bearing N86-30179
FLUID FLOW
Comparisons of CFD flow field solutions with experimental data at Mach 14 [DE86-004915] N86-29784
Pressure drop in flashing flow through obstructions [DE86-007152] N86-30113
Structural dynamics and fluid flow in shell-and-tube heat exchangers. Summary and overview of a DOE/ECUT-sponsored research program [DE86-007798] N86-30114
Computation of dense spray jets [DE86-008176] N86-30118
Modeling of flow fields in oscillating droplets [DE86-008232] N86-30119
Pump instability phenomena generated by fluid forces N86-30181
Whirl/whip demonstration N86-30195
Anti-swirling demonstration N86-30196
Instability in hydraulic machines demonstration rig N86-30199
Effect of interfacial phenomena on contact line heat transfer, 1 [AD-A166088] N86-30557
FLUID MECHANICS
ECUT pulse combustion research program: A milestone report [DE86-007747] N86-29946
Lyapunov stability of ideal compressible and incompressible fluid equilibria in three dimensions [DE86-003648] N86-30107
Evidence of nonuniqueness and oscillatory solutions in computational fluid mechanics [DE86-006493] N86-30111
CAVEAT: A computer code for fluid dynamics problems with large distortion and internal slip [DE86-008570] N86-30120
High accuracy heat capacity measurements through the lambda transition of helium with very high temperature resolution [NASA-CR-177037] N86-30555
FLUORESCENCE
Characterization of high power flashlamps and application to Nd:glass laser pumping [DE86-007116] N86-30155
FLUORINE
Benchmark full configuration-interaction calculations on H2O, F- and F N86-30375
FLUOROCARBONS
Laser induced fluorescence of FCO radicals in the gas phase [MPIS-17/1985] N86-29950
FLUTTER
Flight test of a decoupler pylon for wing/store flutter suppression [NASA-TM-87767] N86-29814
FLUTTER ANALYSIS
Influence of the angle of attack and flutter on the lift of a supercritical wing. Comparison between theory and experiment [ONERA-RT-24/3084-RY-044-R] N86-29786
Eigensystem synthesis for active flutter suppression on an oblique-wing aircraft [NASA-TM-88275] N86-29868
FLUX DENSITY
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo [AD-A166600] N86-30292
FLUX PINNING
Flux pinning by grain boundaries in A15 superconductors [DE86-006250] N86-30538
FLY BY WIRE CONTROL
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft [NASA-TM-88265] N86-29813
FOAMS
Ultra-low density microcellular foams [DE86-007701] N86-30005
FORECASTING
New and future heat pump technologies [DE86-007866] N86-30117
GEM 10B Satellite gravity data and Nigerian oil prospects [DE86-701366] N86-30248
FORMAT
Potentials of large format camera photography [AD-A166079] N86-30126
FORTRAN
Measuring Ada as a software development technology in the Software Engineering Laboratory (SEL) N86-30369
The force on the flex: Global parallelism and portability [NASA-CR-178161] N86-30380
FOSSIL FUELS
Atmospheric carbon dioxide and the global carbon cycle [DE86-006222] N86-30280
FOURIER ANALYSIS
Spectral study of turbulence. Pure rotation and introduction to mode composition [ESA-86-97273] N86-30121
Walsh-Fourier analysis of discrete-valued time series [AD-A166139] N86-30430
FRACTURE MECHANICS
Nondestructive evaluation of metal matrix composites [AD-A166774] N86-29911
FRACTURE STRENGTH
Use of miniaturized tests to predict flow properties and estimate fracture toughness in deformed steel plates [DE86-007644] N86-29981
Elasticity, tear strength and strength of adhesion of soft PVC gels [AD-A166356] N86-29994
Review of fracture properties of nuclear materials determined by Hertzian indentation [DE86-005520] N86-30238
Directed synthesis/fabrication and surface modification of IR window materials for the 8-14 micron region [AD-A166661] N86-30497
FRACTURES (MATERIALS)
Creep and fracture characteristics of materials and structures at elevated temperatures [AD-A166575] N86-30237
FREE ELECTRON LASERS
Nonlinear theory of the free-electron laser [DE86-700668] N86-30146
Desirable excitation patterns for tapered wigglers [DE86-005997] N86-30149
FREE FLOW
Component base flow analysis [AD-A166283] N86-29781
FREE RADICALS
Laser induced fluorescence of FCO radicals in the gas phase [MPIS-17/1985] N86-29950
FREEZING
Resilient modulus of freez-thaw affected granular soils for pavement design and evaluation. Part 1: Laboratory tests on soils from Winchendon, Massachusetts, test sections [FAA/PM-84/16.1] N86-30029
FRENCH SPACE PROGRAMS
Differences between Hermes, US shuttle highlighted N86-29883
FREQUENCY DISTRIBUTION
Wide-band distributed RF coupler [AD-D012214] N86-30049
FREQUENCY MODULATION
Dither-free stabilization of CO2 lasers for far infrared pumping: A photoacoustic approach [DE86-007078] N86-30154
FREQUENCY STABILITY
Stable compensation of nonlinear communications systems (using Volterra systems characterization), volume 2 [AD-A165838] N86-30041
Light-weight hydrogen maser [AD-A165850] N86-30137
Dither-free stabilization of CO2 lasers for far infrared pumping: A photoacoustic approach [DE86-007078] N86-30154
FREQUENCY STANDARDS
Light-weight hydrogen maser [AD-A165850] N86-30137
FRESH WATER
Continental shelf processes affecting the oceanography of the South Atlantic Bight [DE86-008212] N86-30301
FRICTION
Heat transfer, friction, and rheological characteristics of antimisting kerosene N86-30013
Partial rotor-to-stator rub demonstration N86-30197
Rotor instability due to loose rotating part N86-30198
FRICTION REDUCTION
Rotor internal friction instability N86-30167
FRONTS (METEOROLOGY)
Factors leading to the formation of arc cloud complexes [AD-A166501] N86-30291
FUEL CAPSULES
Hollow droplet generator for polymer shell production [DE86-006482] N86-29999
FUEL CELLS
Investigation of alternative MCFC cathode materials at Argonne National Laboratory [DE86-005576] N86-30081
FUEL COMBUSTION
Modeling of chemical kinetics in pulse combustors [DE86-001571] N86-29938
ECUT pulse combustion research program: A milestone report [DE86-007747] N86-29946
Role of fuel chemical properties on combustor radiative heat load [NASA-CR-177096] N86-30023
FUEL CONSUMPTION
Heat exchangers in regenerative gas turbine cycles N86-29857
FUEL INJECTION
Role of fuel chemical properties on combustor radiative heat load [NASA-CR-177096] N86-30023
FUEL PRODUCTION
Antimisting fuel technology for transport category aircraft N86-30008
FUEL SYSTEMS
AMK full-scale transport aircraft validation phase summary N86-30009
UK work on safety fuels N86-30012
Current design procedures for minimizing post crash fire hazards N86-30019
FUEL TANKS
Study of test methods for urethane elastomers [AD-A166293] N86-29992
FUEL TESTS
Antimisting fuel technology for transport category aircraft N86-30008
AMK full-scale transport aircraft validation phase summary N86-30009
Post Controlled Impact Demonstration (CID) analysis N86-30010
UK work on safety fuels N86-30012
AMK: Still viable? N86-30017
FUELS
Cermet fuels for space power systems [DE86-005543] N86-30490
FUNCTIONAL ANALYSIS
Analysis of dynamical systems [AD-A166224] N86-30433
FURANS
Elementary reactions of electronically excited molecules 6. Quenching of O2(1 delta g) by amines, furanes, pyrroles, and thiophenes [MPIS-21/1985] N86-30484
FURNACES
Compilation of information on commercially available ceramic coatings for high-temperature applications [DE86-006740] N86-30002
FUSES (ORDNANCE)
Computer simulation of rocket/missile safing and arming mechanism (containing pin pallet runaway escapement, three-pass involute gear train and acceleration driven rotor) [AD-A166667] N86-29878
FUSION REACTORS
The calculation of hydrogen diffusion through metal membranes [JUEL-2029] N86-29985
Cryogenic mechanical properties of high-manganese steel weldments [DE86-005219] N86-30212

G

GADOLINIUM
Spectroscopic, optical and thermo-mechanical properties of GSGG and its laser performance
[DE86-005773] N86-30156
Research in Gadolinium Scandium Gallium Garnet (GSGG) crystal development
[DE86-004292] N86-30532
GALLIUM
Spectroscopic, optical and thermo-mechanical properties of GSGG and its laser performance
[DE86-005773] N86-30156
Research in Gadolinium Scandium Gallium Garnet (GSGG) crystal development
[DE86-004292] N86-30532
GALLIUM ARSENIDES
500 MHz CCD serial analog memory
[DE86-901019] N86-30084
Comparative studies of electron affinities and work functions for GaAs amd Si
[AD-A166225] N86-30523
Structure and electrical properties of Au contacts to GaAs
[DE86-007499] N86-30550
GALLIUM COMPOUNDS
Preparation and optical properties of GA(x)IN(1-x)P alloys
[NASA-TM-88431] N86-30518
GAMMA RAY LASERS
Critical review of gamma-ray laser proposals
[DE86-006020] N86-30144
Nuclear structure properties for gamma-ray lasers
[DE86-006027] N86-30150
GAMMA RAYS
Bacterial inactivation by means of ionizing radiation
[DE86-901038] N86-30348
GARNETS
Spectroscopic, optical and thermo-mechanical properties of GSGG and its laser performance
[DE86-005773] N86-30156
Research in Gadolinium Scandium Gallium Garnet (GSGG) crystal development
[DE86-004292] N86-30532
GAS ANALYSIS
Detection of chemical vapor mixtures by sorption on multiple piezoelectric crystals
[DE86-006698] N86-29941
GAS COOLING
Heat Transfer and Cooling in Gas Turbines
[AGARD-CP-390] N86-29823
GAS DENSITY
The effect of density ratio on the film-cooling of a flat plate N86-29833
Experimental observation of the structure of shock waves in dusty gas
[AD-A166301] N86-30103
GAS DYNAMICS
Effect of engine discharging jet efflux on vehicle aerodynamic performance
[AD-A166277] N86-29779
A minimum entropy principle in the gas dynamics equations
[NASA-CR-178123] N86-30421
GAS FLOW
Analytical prediction of labyrinth-seal-flow-induced arotor excitation forces N86-30175
GAS INJECTION
The effect of density ratio on the film-cooling of a flat plate N86-29833
Studies of heat transfer on the base of turbine nozzles with and without film cooling N86-29834
A model for correlating flat plate film cooling effectiveness for rows of round holes N86-29840
Effectiveness measurements for a cooling film disrupted by a single jet with wall plunging N86-29844
Alternate cooling configurations for gas turbine combustion systems N86-29845
Full coverage impingement heat transfer: The variation in pitch to diameter ratio at a constant gapp N86-29846
Effect of film cooling on the aerodynamic performance of a turbine cascade N86-29859
Theory and experimental study of a 3-D jet introduced into the secondary flow of a turbine inlet guide vane N86-29860
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades N86-29861
The boundary layer behaviour of an advanced gas turbine rotor blade under the influence of simulated film cooling N86-29862
GAS LASERS
Pointing alignment by orthogonal phase-lock feedback loops
[DE86-006707] N86-30082
GAS PRESSURE
Experimental observation of the structure of shock waves in dusty gas
[AD-A166301] N86-30103
GAS TEMPERATURE
Measurements of fluctuating gas temperatures using compensated fine wire thermocouples N86-29852
GAS TURBINE ENGINES
Heat Transfer and Cooling in Gas Turbines
[AGARD-CP-390] N86-29823
Cooling techniques for gas turbine airfoils: A survey N86-29824
Rotating heat transfer investigations on a multi-pass cooling geometry N86-29825
Wake-passing in a turbine rotor cascade N86-29830
The effect of density ratio on the film-cooling of a flat plate N86-29833
Engine tests on a cooled gas turbine stage N86-29836
Heat-flux measurements and analysis for a rotating turbine stage N86-29838
A model for correlating flat plate film cooling effectiveness for rows of round holes N86-29840
Influence and tip clearance measurement in turbomachines N86-29854
Transient thermal behaviour of a compressor rotor with ventilation: Test results under simulated engine conditions N86-29856
Heat exchangers in regenerative gas turbine cycles N86-29857
GAS TURBINES
Heat Transfer and Cooling in Gas Turbines
[AGARD-CP-390] N86-29823
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins N86-29827
External heat transfer study on a HP turbine rotor blade N86-29828
Effects of wakes on the heat transfer in gas turbine cascades N86-29829
Effects of hole geometry, wall curvature and pressure gradient on film cooling downstream of a single row — gas turbine cooling N86-29831
Effects of surface roughness on heat transfer to gas turbine blades N86-29832
Studies of heat transfer on the base of turbine nozzles with and without film cooling N86-29834
Shroud segments for unshrouded blade turbines N86-29835
Heat transfer test evaluation of the shell-spar blade cooling concept applied to industrial gas turbines N86-29837
Calculation of laminar-turbulent boundary layer transition on turbine blades N86-29839
Computation of thermal radiation for gas turbine conditions N86-29841
Prediction of transient temperatures for an air-cooled rotating disc N86-29842
Heat transfer in gas turbine combustors: A discussion of mathematical modeling of combustion, heat and mass transfer with emphasis on heat transfer in gas turbine combustors N86-29843
Effectiveness measurements for a cooling film disrupted by a single jet with wall plunging N86-29844
Alternate cooling configurations for gas turbine combustion systems N86-29845
Full coverage impingement heat transfer: The variation in pitch to diameter ratio at a constant gapp N86-29846
The measurement of local heat transfer coefficients in blade cooling geometries N86-29848
An optical pyrometer to measure turbine blade surface temperature N86-29849
High frequency response heat flux gauge for metal blading N86-29850
The isentropic light piston annular cascade facil ity at RAE Pyestock N86-29851
Two spot laser velocimeter measurements of velocity and turbulence intensity in shock tube driven turbine flows N86-29853
Simulation of flow and heat transfer in annular cavities between disks in turbomachinery N86-29855
Ceramic heat exchangers for gas turbines or turbojet engines N86-29858
Effect of film cooling on the aerodynamic performance of a turbine cascade N86-29859
Theory and experimental study of a 3-D jet introduced into the secondary flow of a turbine inlet guide vane N86-29860
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades N86-29861
The boundary layer behaviour of an advanced gas turbine rotor blade under the influence of simulated film cooling N86-29862
Microstructural formation and effects on the performance of platinum modified aluminide coatings
[AD-A166166] N86-29963
GAS-LIQUID INTERACTIONS
High accuracy heat capacity measurements through the lambda transition of helium with very high temperature resolution
[NASA-CR-177037] N86-30558
GAS-METAL INTERACTIONS
On the extension of the MCSCF/CI method
[NASA-CR-176933] N86-29924
The nature of chemisorbed oxygen on Ni(100) and Cu(100) N86-29925
A final report on the extension of the MCSCF/CI method N86-29926
Charging and hybridization in the finite cluster model N86-29927
GAS-SOLID INTERACTIONS
Study of surfaces and surface layers on high temperature materials after short-time thermal loads — tokamaks
[JUEL-2024] N86-30514
GASEOUS DIFFUSION
The calculation of hydrogen diffusion through metal membranes
[JUEL-2029] N86-29985
GASES
Halon extinguisher agent behavior in a ventilated small aircraft
[DOT/FAA/CT-86/5] N86-29794
Experimental observation of the structure of shock waves in dusty gas
[AD-A166301] N86-30103
GATES (CIRCUITS)
Macromodeling and optimization of digital MOS VLSI circuits
[AD-A166658] N86-30075
GAUGE THEORY
On the isomorphism between gauge groups before and after renormalization in the presence of Abel subgroups and Higgs fields
[AD-A166276] N86-30431
GAUSS EQUATION
Tail behavior for the suprema of Gaussian processes with a view towards empirical processes
[AD-A166151] N86-30441
GEARS
Computer simulation of rocket/missile safing and arming mechanism (containing pin pellet runaway escapement, three-pass involute gear train and acceleration driven rotor)
[AD-A166667] N86-29878
GELS
Elasticity, tear strength and strength of adhesion of soft PVC gels
[AD-A166356] N86-29994
Amine-CO2 adducts as aviation fuel gelling agents N86-30020
GENERAL AVIATION AIRCRAFT
Halon extinguisher agent behavior in a ventilated small aircraft
[DOT/FAA/CT-86/5] N86-29794
GEOCHEMISTRY
Pandora: An eleven-box geochemical model of the world ocean
[DE86-006122] N86-30265
GEOCHRONOLOGY
The stability of low-latitude sea-surface temperatures: An evaluation of the CLIMAP reconstruction with emphasis on the positive SST anomalies
[DE85-016190] N86-30300
GEODESY
Potentials of large form. camera photography
[AD-A166079] N86-30126
GEODETIC SURVEYS
A radar data processing and enhancement system
[NASA-TM-88274] N86-29884
Longitudinal difference in the Sq profiles in the South American region
[INPE-3944-PRE/968] N86-30271
GEOGRAPHIC INFORMATION SYSTEMS
GIS (Geographic Information System)-based applications with a worldwide database
[AD-A166825] N86-30575
GEOGRAPHY
The effects of color-coding in GEOSIT (geographical situational) displays. 2: Redundant versus non-redundant color-coding
[AD-A166263] N86-30334
A collection of Area of Interest (AOI) algorithms
[NASA-CR-176984] N86-30404
GIS (Geographic Information System)-based applications with a worldwide database
[AD-A166825] N86-30575
GEOLOGY
Geology and petroleum resources of the Barents-northern Kara shelf in light of new geologic data
[DE86-008472] N86-30247

Institutional supporting research and development, 1985
[DE86-008580] N86-30583

GEOMAGNETISM
Research and development activities of the Indian Institute of Geomagnetism N86-30274
The effect of finite Blob size on the current convective instability in the auroral ionosphere
[AD-A166806] N86-30278

GEOPHYSICAL OBSERVATORIES
Research and development activities of the Indian Institute of Geomagnetism N86-30274

GEOPHYSICS
Basic elements of nuclear geophysics
[DE86-700735] N86-30243
Institutional supporting research and development, 1985
[DE86-008580] N86-30583

GLACIERS
Pandora: An eleven-box geochemical model of the world ocean
[DE86-006122] N86-30265

GLASS
Effects of thermal and cyclic loads on silicon carbide yarn reinforced glass matrix composites
[DE86-006793] N86-29913
Spin-coated amorphous chalcogenide resists spin-coated amorphous chalcogenide glasses
[AD-A166270] N86-29991
Elasticity, tear strength and strength of adhesion of soft PVC gels
[AD-A166356] N86-29994
Chalcogenide glasses. Part 2: Optical thickness temperature relation in chalcogenide glass films
[AD-A166589] N86-29995
Chalcogenide glasses. Part 3: Chalcogenide glass-forming systems
[AD-A166592] N86-29996
Hollow droplet generator for polymer shell production
[DE86-006482] N86-29999
Residual stress and deformation energy under ground-surfaces of brittle solids --- glass grinding
[WB-85-16] N86-30241
Versatile laser glass inspection and damage testing facility
[DE86-006306] N86-30502

GLASS LASERS
A high repetition rate and mode-locked phosphate glass laser
[AD-A166303] N86-30141
Characterization of high power flashlamps and application to Nd:glass laser pumping
[DE86-007116] N86-30155
LLE review, Volume 25
[DE86-008195] N86-30158

GLIDE PATHS
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] N86-29801

GLIDERS
Flight determination of the aerodynamic stability and control characteristics of the NASA SGS 1-36 sailplane in the conventional and deep stall angles-of-attack of between -5 and 75 degrees
[NASA-CR-176962] N86-29865

GLOBAL POSITIONING SYSTEM
Will the USAF need ground-based air traffic control radar in the year 2000?
[AD-A166504] N86-29805

GLOW DISCHARGES
Applications of laser annealing and laser-induced diffusion to photovoltaic conversion
[DE86-003809] N86-30254

GLYCOLS
Small angle neutron scattering study on a polymer blend: Characterization of the deformation behavior
[DE86-006099] N86-30003

GOLD
Structure and electrical properties of Au contacts to GaAs
[DE86-007499] N86-30550

GOODNESS OF FIT
On moderate and large deviations in multinomial distributions
[IR-242] N86-30442
The number of classes in chi-square goodness of fit tests
[IR-248] N86-30451

GOVERNMENT PROCUREMENT
A program manager's guide on multiyear procurement
[AD-A166463] N86-30566

GRADIENTS
Fugacity and concentration gradients in a gravity field
[NASA-TM-88809] N86-30620

GRAIN BOUNDARIES
Mechanism of stress-corrosion cracking of Alloy X-750 in high purity water
[DE86-006361] N86-29969
Computer simulations of the structure and properties of grain boundary dislocations
[DE86-007005] N86-29977
Microstructure, microchemistry, and microdeformation of Alloy 600 tubing
[DE86-007947] N86-29983
Flux pinning by grain boundaries in A15 superconductors
[DE86-008250] N86-30538
Role of interfaces in cavity formation
[DE86-004763] N86-30543

GRAMMARS
An algorithm to find minimal sequences of pass directions for attribute grammars --- programming languages
[INF-83-6] N86-30399

GRAPH THEORY
Graph theory in the study of metal cluster bonding topology: Applications to metal clusters having fused polyhedra
[AD-A166623] N86-29937
The Steiner tree problem. Linear programming model and decomposition technique resolution
[ENST-85E010] N86-30394

GRAPHITE
Carbon-rich ceramic composites from ethynyl aromatic precursors
[NASA-TM-88812] N86-29908
Studies of metal/carbon surface chemistry, September 1, 1985-November 30, 1985
[DE86-007419] N86-29915

GRAPHITE-EPOXY COMPOSITES
Differences in interfacial bond strengths of graphite fiber-epoxy resin composites
[NASA-CR-176912] N86-29905
A modified microbonding test for direct in-situ fiber/matrix bond strength determination in fiber composites
[MIT-RR-R84-3] N86-29906
Tension strength of a thick graphite/epoxy laminate after impact by a 1/2-in. radius impactor
[NASA-TM-87771] N86-29907
Development of composite tube protective coatings
[NASA-CR-178116] N86-29989

GRATINGS (SPECTRA)
Varied line-space gratings: past, present and future
[DE86-007498] N86-30503

GRAVIMETRY
GEM 10B Satellite gravity data and Nigerian oil prospects
[DE86-701366] N86-30248

GRAVITATION
GEM 10B Satellite gravity data and Nigerian oil prospects
[DE86-701366] N86-30248
Fugacity and concentration gradients in a gravity field
[NASA-TM-88809] N86-30620

GRAVITATIONAL EFFECTS
The temporal response of bone to unloading
[NASA-TM-89228] N86-30303
Medical Selection and Physiological Training of Future Fighter Aircrew
[AGARD-CP-396] N86-30309
Medical selection and physiological training of fighter pilots: A 1985 perspective and overview N86-30312
Effects of simulated weightlessness on meiosis. Fertilization, and early development in mice
[NASA-CR-177106] N86-30342

GRAVITY WAVES
Perturbations of the Richardson number field by gravity waves
[NASA-CR-176910] N86-30273

GRINDING (MATERIAL REMOVAL)
Residual stress and deformation energy under ground-surfaces of brittle solids --- glass grinding
[WB-85-16] N86-30241

GROUND BASED CONTROL
Will the USAF need ground-based air traffic control radar in the year 2000?
[AD-A166504] N86-29805

GROUND EFFECT (AERODYNAMICS)
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] N86-29782

GROUND STATE
On the low-lying states of CuO N86-29928
Molecular reaction rates
[AD-A166518] N86-30479
Astrophysical materials science: Theory
[NASA-CR-177021] N86-30610

GROUND STATIONS
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] N86-29801
China's satellite communications discussed
N86-30065

GROUND SUPPORT SYSTEMS
Applications of satellite meteorology in support of space shuttle
[AD-A166227] N86-30288

GROUP DYNAMICS
On the isomorphism between gauge groups before and after renormalization in the presence of Abel subgroups and Higgs fields
[AD-A166276] N86-30435

GROUP THEORY
Control of nonlinear distributed parameter systems using fixed point techniques
[INPE-3922-PRE/958] N86-30457
Closed images of topological groups
[IR-243] N86-30463

GUIDE VANES
The isentropic light piston annular cascade facility at RAE Pyestock N86-29851
Theory and experimental study of a 3-D jet introduced into the secondary flow of a turbine inlet guide vane
N86-29860

GUN PROPELLANTS
Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025

GUSTS
The physical and empirical basis for a specific clear-air turbulence risk index
[NASA-CR-3971] N86-30285

H

HALLEY'S COMET
Hungarian space research 1981-1985: Lectures and review articles
[NASA-TM-87992] N86-30580
The hydrogen coma of Comet Halley before perihelion: Preliminary observations with dynamics Explorer 1
[NASA-CR-177091] N86-30612

HALOGENS
Laser studies of halogens and oxygen
[AD-A166257] N86-30477

HAMILTONIAN FUNCTIONS
Molecular reaction rates
[AD-A166518] N86-30479

HARMONICS
Generalized banana-drift transport
[DE86-002535] N86-30509

HASTELLOY (TRADEMARK)
Evaluation of the numerical stability and sensitivity of material parameter variations for several unified constitutive models
[MM-4998-85-6-PT-1] N86-30230

HAZARDS
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] N86-29806
Extreme winds and tornadoes: An overview
[DE86-006162] N86-30294

HEART FUNCTION
Selection and medical testing of Mirage 2000 pilots: Report of echocardiography N86-30314
The use of ECG changes caused by acceleration as tolerance predicition factors N86-30316

HEAT
Institutional supporting research and development, 1985
[DE86-008580] N86-30583

HEAT BALANCE
An introduction to ice in the polar oceans
[AD-A166140] N86-30298

HEAT EXCHANGERS
Heat Transfer and Cooling in Gas Turbines
[AGARD-CP-390] N86-29823
Heat exchangers in regenerative gas turbine cycles
N86-29857
Ceramic heat exchangers for gas turbines or turbojet engines N86-29858
Oxidizer heat exchanger component testing
[NASA-CR-179487] N86-29901
Compilation of information on commercially available ceramic coatings for high-temperature applications
[DE86-006740] N86-30002

Structural dynamics and fluid flow in shell-and-tube heat exchangers. Summary and overview of a DOE/ECUT-sponsored research program
[DE86-007798] N86-30114

HEAT FLUX

Heat-flux measurements and analysis for a rotating turbine stage N86-29838

High frequency response heat flux gauge for metal blading N86-29850

Transient heat conduction in semi-infinite solids with temperature dependent properties
[AD-A166613] N86-30105

HEAT GENERATION

Heat transfer in gas turbine combustors: A discussion of mathematical modeling of combustion, heat and mass transfer with emphasis on heat transfer in gas turbine combustors N86-29843

HEAT PIPES

Study of heat exchangers between a liquid loop feeder and a heat-pipe radiator --- spacecraft thermal control
[FOK-TR-R-84-108] N86-30089

Modeling of transient heat pipe operation
[NASA-CR-177143] N86-30099

Effect of interfacial phenomena on contact line heat transfer, 1
[AD-A166088] N86-30557

HEAT PUMPS

Influence of conditions on the performance of small heat pumps
[DE86-751178] N86-30115

New and future heat pump technologies
[DE86-007866] N86-30117

Background review on compressors for gas engine-driven heat pumps
[PB86-201175] N86-30220

HEAT RESISTANT ALLOYS

Connection of high-temperature strength and structural state of steel 12KhIMF with parameters of signals of acoustic emission under tension
[BLL-M-36736-(5828.4)] N86-29953

Integrated research in constitutive modelling at elevated temperatures, part 1
[NASA-CR-177237] N86-30227

Integrated research in constitutive modelling at elevated temperatures: Summary of the project N86-30228

On the use of internal state variables in thermoviscoplastic constitutive equations N86-30231

HEAT SHIELDING

Experimental study of chemical alleviation for improving reentry communication
[AD-A165862] N86-30042

HEAT SOURCES

General-Purpose Heat Source safety verification test series, SVT-1 through SVT-6
[DE85-017956] N86-30489

Space Nuclear Safety Program
[DE86-007197] N86-30492

Space Nuclear Safety Program
[DE86-007206] N86-30493

HEAT TRANSFER

Heat Transfer and Cooling in Gas Turbines
[AGARD-CP-390] N86-29823

Cooling techniques for gas turbine airfoils: A survey N86-29824

Rotating heat transfer investigations on a multi-pass cooling geometry N86-29825

Local and mean heat transfer on the leading and trailing surfaces of a square-sectioned duct rotating in the orthogonal-mode N86-29826

Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins N86-29827

External heat transfer study on a HP turbine rotor blade N86-29828

Effects of wakes on the heat transfer in gas turbine cascades N86-29829

Wake-passing in a turbine rotor cascade N86-29830

Effects of surface roughness on heat transfer to gas turbine blades N86-29832

Studies of heat transfer on the base of turbine nozzles with and without film cooling N86-29834

Shroud segments for unshrouded blade turbines N86-29835

Heat transfer test evaluation of the shell-spar blade cooling concept applied to industrial gas turbines N86-29837

Calculation of laminar-turbulent boundary layer transition on turbine blades N86-29839

A model for correlating flat plate film cooling effectiveness for rows of round holes N86-29840

Heat transfer in gas turbine combustors: A discussion of mathematical modeling of combustion, heat and mass transfer with emphasis on heat transfer in gas turbine combustors N86-29843

Alternate cooling configurations for gas turbine combustion systems N86-29845

Full coverage impingement heat transfer: The variation in pitch to diameter ratio at a constant gapp N86-29846

High frequency response heat flux gauge for metal blading N86-29850

The isentropic light piston annular cascade facility at RAE Pyestock N86-29851

Simulation of flow and heat transfer in annular cavities between disks in turbomachinery N86-29855

Transient thermal behaviour of a compressor rotor with ventilation: Test results under simulated engine conditions N86-29856

A comprehensive analysis algorithm for ablation, temperature fields and thermal stresses of the carbon-base nosetips
[AD-A166615] N86-29896

ECUT pulse combustion research program: A milestone report
[DE86-007747] N86-29946

Heat transfer, friction, and rheological characteristics of antimisting kerosene N86-30013

Hydrodynamics and heat transfer in a liquid film under the end of a rotating cylinder
[BLL-M-36755-(5828.4)] N86-30088

Numerical simulation of the flowfield over ice accretion shapes
[NASA-CR-176960] N86-30093

Transient heat conduction in semi-infinite solids with temperature dependent properties
[AD-A166613] N86-30105

International Workshop on Two-Phase Flow Fundamentals
[DE86-006548] N86-30112

Calculating the temperature and stresses when one side of a plate is heated with a constant flow of heat
[BLL-M-36723-(5828.4)] N86-30226

Technical issues and requirements of experiments and facilities for fusion nuclear technology, FINESSE phase 1, volume 2
[DE86-006503] N86-30511

Effect of interfacial phenomena on contact line heat transfer, 1
[AD-A166088] N86-30557

HEAT TRANSFER COEFFICIENTS

Effects of hole geometry, wall curvature and pressure gradient on film cooling downstream of a single row --- gas turbine cooling N86-29831

The effect of density ratio on the film-cooling of a flat plate N86-29833

The measurement of local heat transfer coefficients in blade cooling geometries N86-29848

Bearing tester data compilation analysis, and reporting and bearing math modeling
[NASA-CR-176909] N86-30205

HEAT TREATMENT

Properties of spring steels hardened in polymer-bearing medium
[BLL-M-36734-(5828.4)] N86-29952

Microstructural formation and effects on the performance of platinum modified aluminide coatings
[AD-A166166] N86-29963

Chemically cross-linked heat-shrinkable polyethylene tubes
[AD-A166745] N86-29997

HEATERS

Cryogenic explosion environment modeling and testing of space shuttle and light-weight radioisotope heater unit interactions
[DE86-005901] N86-29881

HEATING

Cooling techniques for turbojet pre-heater channels N86-29847

Turbulent heating and transfer in the stratosphere and lower mesosphere
[AD-A166591] N86-30276

Anomalous US weather patterns accompanying stratospheric sudden warming
[AD-A166371] N86-30290

HEAVY IONS

Cross section calculations for subthreshold pion production in peripheral heavy-ion collisions
[NASA-TP-2600] N86-30485

HELICOPTER ENGINES

Heat exchangers in regenerative gas turbine cycles N86-29857

HELICOPTERS

Analytical investigation of rotor wake formation and geometry
[NASA-CR-177032] N86-29768

National Transportation Safety Board safety recommendation
[NTSB-4357/1] N86-29792

Investigation of hazards of helicopter operations and root causes of helicopter accidents
[FAA/PM-86/28] N86-29796

Technology research for strapdown inertial experiment and digital flight control and guidance
[NASA-CR-176907] N86-29800

Optimal landing of a helicopter in autorotation
[NASA-CR-177082] N86-29808

Multi-variable control of the GE T700 engine using the LQG/LTR design methodology
[NASA-CR-177080] N86-29819

A new version of the helicopter aural detection program, ICHIN
[NASA-TM-87745] N86-30471

Auditory helicopter detection and localization; a literature review focusing on search for helicopters
[FOA-C-50033-H2] N86-30474

HELIUM ATOMS

Measurement of absolute emission cross sections for extreme ultraviolet (EUV) photons in thermal collisions of metastable helium (2 sup 1 S) with neon and helium
[MPIS-14/1985] N86-30480

HELMETS

The vertebral column: Selection and aptitude of combat aircraft pilots of the future N86-30322

HELMHOLTZ VORTICITY EQUATION

On the use of internal state variables in thermoviscoplastic constitutive equations N86-30231

HEMATOLOGY

Biological studies of swine exposed to 60-Hz electric fields. Volume 5: Hematology and serum chemistry
[DE86-005362] N86-30344

HERMES MANNED SPACEPLANE

West Europe report: Science and technology
[JPRS-WST-86-016] N86-29882

Differences between Hermes, US shuttle highlighted N86-29883

HETEROCYCLIC COMPOUNDS

Phenylquinoxaline resin compositions
[AD-D012230] N86-29912

Phenylquinoxaline resin monomers
[AD-D012236] N86-29998

HEURISTIC METHODS

A browser for directed graphs
[AD-A166622] N86-30383

HIERARCHIES

Design of a Data Storage Hierarchy DSH-2: Software and hardware
[AD-A166287] N86-30571

HIGH ALTITUDE TESTS

Development drop test results of the 15-ft-dia ribbon parachute and 73-ft-dia cross parachute for the US Army Natick Laboratory UHLCADS System
[DE85-017614] N85-29785

HIGH ENERGY ELECTRONS

Frequency quadrupled Nd-Yag laser for LEGS
[DE86-006133] N86-30152

HIGH LEVEL LANGUAGES

The status of verification technology for the Ada (Trademark) language
[AD-A166664] N86-30384

HIGH POLYMERS

GTA/BASF antimisting fuel research N85-30021

HIGH POWER LASERS

Characterization of high power flashlamps and application to Nd:glass laser pumping
[DE86-007116] N86-30155

HIGH PRESSURE

Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025

High pressure electron resonance studies of electronic, magnetic and structural phase transitions
[DE85-016971] N86-30544

HIGH SPEED CAMERAS

Laser ignition studies
[DE86-006043] N86-30151

HIGH SPEED PHOTOGRAPHY

Laser ignition studies
[DE86-006043] N86-30151

HIGH STRENGTH STEELS

Non-metallic inclusions in cast low-alloy steel with titanium additions
[BLL-M-36733-(5828.4)] N86-29951

HIGH TEMPERATURE

Mechanism of stress-corrosion cracking of Alloy X-750 in high purity water
[DE86-006361] N86-29969

Creep and fracture characteristics of materials and structures at elevated temperatures
[AD-A166575] N86-30237

Point defects and high-temperature deformation of NiO
[DE86-005560] N86-30534

HIGH TEMPERATURE ENVIRONMENTS

Study of surfaces and surface layers on high temperature materials after short-time thermal loads --- tokamaks
[JUEL-2024] N86-30514

HIGH TEMPERATURE PLASMAS
Non-LTE atomic physics model for laser fusion and X-ray laser simulation
[DE86-006487] N86-30145
HIGH TEMPERATURE TESTS
Connection of high-temperature strength and structural state of steel 12KhMF with parameters of signals of acoustic emission under tension
[BLL-M-36736-(5828.4)] N86-29953
HILBERT SPACE
Tail behavior for the suprema of Gaussian processes with a view towards empirical processes
[AD-A166151] N86-30461
HISTORIES
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] N86-29764
Powder metallurgy: Achievements, details and plans
[BLL-M-36780-(5828.4)] N86-29956
Varied line-space gratings: past, present and future
[DE86-007498] N86-30503
HMX
Comparison of extraction techniques and solvents for explosive residues in soil
[AD-A166474] N86-30026
HOLE GEOMETRY (MECHANICS)
Effects of hole geometry, wall curvature and pressure gradient on film cooling downstream of a single row — gas turbine cooling N86-29831
A model for correlating flat plate film cooling effectiveness for rows of round holes N86-29840
Effectiveness measurements for a cooling film disrupted by a single jet with wall plunging N86-29844
Full coverage impingement heat transfer: The variation in pitch to diameter ratio at a constant gapp N86-29846
HOLOGRAPHY
The Mellin transform filter: A computer generated hologram
[AD-A166191] N86-30127
HOMOMORPHISMS
Continuity of convexity preserving functions
[IR-237] N86-30441
HOOP COLUMN ANTENNAS
Near-field testing of the 15-meter model of the hoop column antenna. Volume 2: Near- and far-field plots for the LaRC feeds
[NASA-CR-178060] N86-29877
HORIZONTAL ORIENTATION
Improving the interpretability of an aircraft attitude indicator
[AD-A166329] N86-29817
Design and initial testing of a one-bladed 30-meter-diameter rotor on the NASA/DOE mod-O wind turbine
[NASA-TM-88810] N86-30251
HORMONES
A possible role for endogenous glucocorticoids in orchiectomy-induced atrophy of the rat levator ani muscle: Studies with RU38486, a potent and selective antiglucocorticoid
[NASA-CR-177029] N86-30343
HOT ELECTRONS
Stimulated Raman scattering: Comparison of theory and experiment
[DE86-006480] N86-30501
HOT ISOSTATIC PRESSING
Directed synthesis/fabrication and surface modification of IR window materials for the 8-14 micron region
[AD-A166661] N86-30497
HOT PRESSING
Performance of commercial and research grade SiC whiskers in a borosilicate glass matrix
[DE86-007379] N86-29914
HOVERING
An experimental and analytical method for approximate determination of the tilt rotor research aircraft rotor/wing download
[NASA-CR-176970] N86-29769
HUMAN BEINGS
Spatiotemporal characteristics of visual localization
[AD-A166097] N86-30331
HUMAN CENTRIFUGES
Assisted positive pressure breathing and modified anti-acceleration suit filling tested up to 9 G in a human centrifuge, Karolinska Institute
[FOA-C-50038-H1] N86-30341
HUMAN FACTORS ENGINEERING
Feasibility study for ergonomic analysis and design of future helicopter cockpit systems
[NASA-CR-176942] N86-29811
Medical selection and physiological training of fighter pilots: A 1985 perspective and overview N86-30312
Activities report in perception research
[IPO-19-1984] N86-30335
Human factors activities in teleoperator development at the Oak Ridge National Laboratory
[DE86-005160] N86-30340
HUMAN PERFORMANCE
The effect of spectrally selective filters on visual search performance
[AD-A165835] N86-30329
An investigation of the use of steady-state evoked potentials for human performance and workload assessment and control
[AD-A166205] N86-30332
The effects of color-coding in GEOSIT (geographical situational) displays. 2: Redundant versus non-redundant color-coding
[AD-A166263] N86-30334
Activities report in perception research
[IPO-19-1984] N86-30335
Attention tasks and their relation to aging and flight experience
[IZF-1986-4] N86-30337
Development of an algorithm to model an aircraft equipped with a generic CDTI display
[NASA-TM-87732] N86-30349
HUMAN RELATIONS
Implications of privacy needs and interpersonal distancing mechanisms for space station design
[NASA-CR-176938] N86-30338
HUMIDITY
Aging of carbon-epoxy composite in humid environments
[PV-42-791/F] N86-29921
An environmentally-controlled extended-use small animal hypobaric chamber
[AD-A166729] N86-30307
Effects of 60 Hz electric field on operant and social stress behaviors of nonhuman primates
[DE85-016121] N86-30348
HUMIDITY MEASUREMENT
Sensitivity of refractive index profile models to relative humidity sensor errors
[AD-A166626] N86-30293
HUNGARY
Hungarian space research 1981-1985: Lectures and review articles
[NASA-TM-87992] N86-30580
HYDRAULIC EQUIPMENT
Adaptive control system. Volume 1. Equipment and testing
[AD-A166036] N86-30074
Fatigue test machine
[AD-D012232] N86-30133
Instability in hydraulic machines demonstration rig N86-30199
HYDRAULIC FLUIDS
Hydraulic induced instability on a vertical service N86-30189
HYDRIDES
Theory of electronic states in disordered alloy hydrides
[DE86-006260] N86-30539
HYDROCHLORIC ACID
Data collection and analysis for HCl, SO2, and NO2 immission-emission differential absorption lidars
[GKSS-85/E/53] N86-30268
HYDRODYNAMICS
Hydrodynamics and heat transfer in a liquid film under the end of a rotating cylinder
[BLL-M-36755-(5828.4)] N86-30088
NASA-VOF2D: a computer program for incompressible flows with free surfaces
[DE86-007195] N86-30116
Backward whirl in a simple rotor supported on hydrodynamic bearings N86-30172
HYDROFLUORIC ACID
Benchmark full configuration-interaction calculations on HF and NH2 N86-30376
HYDROGEN
Hydrogen-combustion analyses of large-scale tests
[DE86-004722] N86-29944
Transport coefficients for carbon, hydrogen, and the organic mixture C2H3
[DE86-008323] N86-29949
The calculation of hydrogen diffusion through metal membranes
[JUEL-2029] N86-29985
Mean trajectory gaussian wave packet approach to rotationally inelastic molecule-surface diffraction
[AD-A166275] N86-30478
A multiple Gaussian wave packet theory of H2 diffraction and rotational excitation by collision with solid surfaces
[AD-A166291] N86-30529
The hydrogen coma of Comet Halley before perihelion: Preliminary observations with dynamics Explorer 1
[NASA-CR-177091] N86-30612
A study of (OI) 63.2 and 145.5 micron emission from M17 and SGR A from the Lear jet
[NASA-CR-177015] N86-30625
HYDROGEN BONDS
Benchmark full configuration-interaction calculations on H2O, F- and F N86-30375
HYDROGEN ISOTOPES
Observations of mass transport phenomena in multicomponent liquid mixtures
[DE85-006483] N86-30110
HYDROGEN MASERS
Light-weight hydrogen maser
[AD-A165850] N86-30137
HYDROGENATION
Light-induced excess conductivity and the role of argon in the deposition of doping-modulated amorphous silicon superlattices
[DE86-005812] N86-30535
HYDROSTATIC PRESSURE
Why have hydrostatic bearings been avoided as a stabilizing element for rotating machines N86-30165
HYPERBOLIC FUNCTIONS
Convenient stability criteria for difference approximations of hyperbolic initial-boundary value problems
[NASA-CR-178134] N86-30422
Estimation of discontinuous coefficients and boundary parameters for hyperbolic systems
[NASA-CR-178133] N86-30424
HYPERSONIC FLOW
Comparisons of CFD flow field solutions with experimental data at Mach 14
[DE86-004915] N86-29784
HYPERVELOCITY GUNS
Fundamental relativistic solution for the railgun
[AD-A166607] N86-30467
One-component plasma model and large Z laboratory plasmas
[AD-A166606] N86-30506
HYPERVELOCITY IMPACT
Hypervelocity particle capture: Some considerations regarding suitable target media N86-30592
The solar maximum satellite capture cell: Impact features and orbital debris and micrometeoritic projectile materials N86-30596
Intact capture of hypervelocity particles N86-30600
HYPERVELOCITY PROJECTILES
Intact capture of hypervelocity particles N86-30603
HYPOBARIC ATMOSPHERES
An environmentally-controlled extended-use small animal hypobaric chamber
[AD-A166729] N86-30307
HYPOXIA
Hypobaric training of flight personnel without compromising quality of life N86-30327

I

ICE
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129
ICE FORMATION
Numerical simulation of the flowfield over ice accretion shapes
[NASA-CR-176960] N86-30093
An introduction to ice in the polar oceans
[AD-A166140] N86-30298
IDEAL FLUIDS
Lyapunov stability of ideal compressible and incompressible fluid equilibria in three dimensions
[DE86-003648] N86-30107
IGNITION
Fireworks in space
[AD-A166268] N86-29902
Modeling of chemical kinetics in pulse combustors
[DE86-001571] N86-29938
Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025
Laser ignition studies
[DE86-006043] N86-30151
IMAGE ANALYSIS
Implementation of map-to-image-correspondence for synthetic aperture radar image analysis
[AD-A166791] N86-30246
Algorithm for segmentation of multichannel images
[AD-A166215] N86-30382
Optimization of an interactive distributive computer network
[NASA-CR-177373] N86-30405
IMAGE CONTRAST
Sensitivity to color contrasts and the selection of navigator personnel N86-30318

IMAGE PROCESSING
Implementation of map-to-image-correspondence for synthetic aperture radar image analysis
[AD-A166791] N86-30246
Novel architectures for image processing based on computer simulation and psychophysical studies of human visual cortex
[AD-A166222] N86-30333
Compositing DISSPLA output with synthetic images ISSCO week 86
[DE86-004555] N86-30388
The effect of aberrations and apodisation on the performance of coherent imaging systems
[AD-A165886] N86-30494
IMAGES
Compositing DISSPLA output with synthetic images ISSCO week 86
[DE86-004555] N86-30388
IMAGING TECHNIQUES
Imaging and sounding instruments in the spin stabilized version of the second generation Meteosat
[REPT-60/1568] N86-29899
Research with nearfield acoustic holography
[AD-A166679] N86-30130
The effect of aberrations and apodisation on the performance of coherent imaging systems
[AD-A165886] N86-30494
Imaging of surfaces and defects of crystals
[DE86-008302] N86-30552
IMMOBILIZATION
The temporal response of bone to unloading
[NASA-TM-89228] N86-30303
IMMUNOLOGY
Biological studies of swine exposed to 60-Hz electric fields. Volume 6: Immunology
[DE86-005363] N86-30345
IMPACT DAMAGE
An in-situ measurement of particulates from solid rocket motors fired in space N86-30585
Bilateral symmetry of circular impact structures of astroblemes
[NASA-TM-88480] N86-30616
IMPACT RESISTANCE
Influence of the test method and the material stiffness on the low velocity impact damage of carbon-epoxy composites, part 2
[PV-47-166/F-PT-2] N86-29920
IMPACT TESTS
Full-Scale Transport Controlled Impact Demonstration Program photographic/video coverage
[DOT/FAA/CT-85/35] N86-29795
Influence of the test method and the material stiffness on the low velocity impact damage of carbon-epoxy composites, part 2
[PV-47-166/F-PT-2] N86-29920
Intact capture of hypervelocity particles N86-30603
IMPURITIES
Double-injection, deep-impurity switch development
[NASA-CR-174936] N86-30073
Anomalous behavior during the solidification of silicon in the presence of impurities
[DE86-007395] N86-30548
INCOHERENT SCATTER RADAR
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292
INCOHERENT SCATTERING
The influence of negative ions on the incoherent diffusion of electromagnetic waves in the D region of the ionosphere
[AERONOMICA-ACTA-A-302-1985] N86-30269
INCOMPRESSIBLE FLOW
Lyapunov stability of ideal compressible and incompressible fluid equilibria in three dimensions
[DE86-003648] N86-30107
NASA-VOF2D: a computer program for incompressible flows with free surfaces
[DE86-007195] N86-30116
INCONEL (TRADEMARK)
Microstructure, microchemistry, and microdeformation of Alloy 600 tubing
[DE86-007947] N86-29983
INDEXES (DOCUMENTATION)
NASA thesaurus supplement
[NASA-SP-7053-SUPP-1] N86-30569
Artificial intelligence indexing: Creating knowledge bases of index terms ordered by semantic relations
[AD-A166768] N86-30574
INDEXES (RATIOS)
One-parameter families of optimization problems: Equality constraints
[ESA-86-97357] N86-30444
INDIAN SPACE PROGRAM
Satellites said to function well, plans revealed
N86-29898
INDIUM ALLOYS
Preparation and optical properties of GA(x)IN(1-x)P alloys
[NASA-TM-88431] N86-30518
INDIUM ANTIMONIDES
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166242] N86-30524
INDUSTRIES
Some tentative ideas on developing our low-alloy and alloy steel
[AD-A166269] N86-29964
INELASTIC SCATTERING
Time dependent variational description of one-dimensional inelastic scattering
[DE86-700610] N86-30055
Mean trajectory gaussian wave packet approach to rotationally inelastic molecule-surface diffraction
[AD-A166275] N86-30478
Theoretical investigation of the scattering of the rotation-bending coupling, and study of intensity weakening using an optical model: Calculations for the systems H2-LiF(001) and HD-Ag(111)
[MPIS-16/1985] N86-30483
Elastic and inelastic surface effects on ion penetration and the resulting sputtering and backscattering
[DE85-016604] N86-30545
INEQUALITIES
Valid inequalities for mixed 0-1 problems --- operations research
[ESA-86-97305] N86-30459
INERTIAL CONFINEMENT FUSION
Observations of mass transport phenomena in multicomponent liquid mixtures
[DE86-006483] N86-30110
INERTIAL FUSION (REACTOR)
Hollow droplet generator for polymer shell production
[DE86-006482] N86-29999
INERTIAL NAVIGATION
Investigation of fast reaction SAW (Surface Acoustic Wave) accelerometer
[AD-A166779] N86-30131
INFERENCE
On inference and transient response for M/G/1 models
[AD-A166578] N86-30458
INFORMATION DISSEMINATION
The DoD gateway information system: Prototype experience
[AD-A166200] N86-30570
INFORMATION MANAGEMENT
Translation table for DOE/OSTI - COSATI bibliographic records to MARC format records
[DE86-006473] N86-30576
INFORMATION RETRIEVAL
Division of attention as a function of the number of steps, visual shifts, and memory load
[NASA-TM-88775] N86-30328
The DoD gateway information system: Prototype experience
[AD-A166200] N86-30570
Scientific and technical information search and service in the research and development of military products
[AD-A166300] N86-30572
Artificial intelligence indexing: Creating knowledge bases of index terms ordered by semantic relations
[AD-A166768] N86-30574
Records, documentation storage and retrieval system, phase 2
[DE86-007219] N86-30577
INFORMATION SYSTEMS
Proceedings of the 1984 CERN School of Computing
[DE86-700783] N86-30355
The DoD gateway information system: Prototype experience
[AD-A166200] N86-30570
Records, documentation storage and retrieval system, phase 2
[DE86-007219] N86-30577
INFORMATION THEORY
Input signal design for system identification: a comparative analysis
[ER-84/06] N86-30402
INFRARED DETECTORS
Non-intrusive speed sensor
[NASA-CR-178873] N86-30125
Development of optimized detector/spectrophotometer technology for low background space astronomy missions
[NASA-CR-177142] N86-30609
INFRARED SCANNERS
Evaluation of selected detector arrays for space applications
[NASA-CR-176979] N86-30124
INFRARED SPECTRA
Molecular reaction rates
[AD-A166518] N86-3047
Theoretical study of the radiative and kinetic propertie of selected metal oxides and air molecules
[AD-A166113] N86-3052
INFRARED SPECTROSCOPY
Experimental study of electronic states a metal-dielectric interfaces
[AD-A166242] N86-3052
Experimental study of electronic states a metal-dielectric interfaces
[AD-A166290] N86-3052
INFRARED TELESCOPES
Imaging and sounding instruments in the spin stabilize version of the second generation Meteosat
[REPT-60/1568] N86-2989
INFRARED WINDOWS
Infrared monitoring of gyrotron windows
[DE86-002449] N86-3013
Directed synthesis/fabrication and surface modificatio of IR window materials for the 8-14 micron region
[AD-A166661] N86-3043
INFRASONIC FREQUENCIES
Infrasound from distant rocket launches
[PB86-182771] N86-3047
INHIBITORS
Inhibiting corrosion cracking: Crack tip chemistry an physics
[AD-A166317] N86-2996
INJECTION
Double-injection, deep-impurity switch developmen
[NASA-CR-174936] N86-3007
INJURIES
Systematic radiographic examination of the spine fo selection of F-16 pilots: A preliminary report
N86-3032
INORGANIC CHEMISTRY
Activities report of the Materials Science Center
[ESA-86-97388] N86-2990
Activities report of the Materials Science Center
[ESA-86-97389] N86-2990
INPUT
Input signal design for system identification; a comparative analysis
[ER-84/06] N86-3040
Application of input signal design in system identificatio for adaptive control
[ER-84/04] N86-3041
Adaptive control of first-order systems with time-delay
[ER-84/05] N86-3041
INSPECTION
Industrial inspection of grain size of precision tubes afte heat treatment
[BLL-M-36744-(5828.4)] N86-3022
Versatile laser glass inspection and damage testing facility
[DE86-006306] N86-3050
INSTALLING
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] N86-2980
Subsystem hazard analysis for the LSI models 6216A, B and C self-contained navigation sysgem group A
[AD-A166816] N86-2980
INSTRUMENT ERRORS
Sensitivity of refractive index profile models to relative humidity sensor errors
[AD-A166626] N86-3029
INSTRUMENT FLIGHT RULES
The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways
[AD-A166485] N86-2980
INSTRUMENT LANDING SYSTEMS
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] N86-2980
Engineering performance evaluation of small community airport microwave landing system (TI-model) at Philadelphia International Airport Runway 17
[FAA/PM-86/24] N86-2980
INSULATION
A conductively cooled laser diode array pumped laser
[AD-D012217] N86-3014
INTEGERS
Counting numbers representable as sums of two squares
[LUT-MR-180] N86-3041
INTEGRAL EQUATIONS
Compliance matrices for cracked bodies
[NASA-CR-179478] N86-3023

Computational efficiency study of a semi-analytical technique for the angular integral estimation found in transfer matrix generation
[DE86-700784] N86-30462

INTEGRALS
integral processing in beyond-Hartree-Fock calculations N86-30374

INTEGRATED CIRCUITS
MMIC devices for active phased array antennas
[NASA-CR-176990] N86-30037
Asymmetrical coupled coplanar-type transmission lines with anisotropic substrates N86-30038
Macromodeling and optimization of digital MOS VLSI circuits
[AD-A166658] N86-30075
Monolithic low noise amplifier with limiting --- application to Global Positioning System receivers
[AD-D012225] N86-30076
Proceedings of the 1984 CERN School of Computing
[DE86-700783] N86-30355
Semiconducting transition metal silicides for electro-optic VSLI interconnects
[AD-A165895] N86-30519
Electrical characteristics and testing considerations for gate oxide shorts in CMOS ICs
[DE85-016168] N86-30542

INTELLIGENCE
A collection of Area of Interest (AOI) algorithms
[NASA-CR-176984] N86-30404

INTERACTIVE CONTROL
MECHAN: Dynamic analysis of planar mechanisms
[DE85-018023] N86-30214

INTERCEPTION
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] N86-29764

INTERFACES
X-ray studies of the solid-electrolyte interface
[DE86-003639] N86-29943
Interfacial tension of demixed polymer solutions
[DE86-003035] N86-30000
CAVEAT: A computer code for fluid dynamics problems with large distortion and internal slip
[DE86-008570] N86-30120
Observations from a prototype implementation of the Common APSE Interface Set (CAIS) N86-30368
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166290] N86-30528
Role of interfaces in cavity formation
[DE86-004763] N86-30543
Structure and electrical properties of Au contacts to GaAs
[DE86-007499] N86-30550

INTERFACIAL TENSION
A modified microbonding test for direct in-situ fiber/matrix bond strength determination in fiber composites
[MIT-RR-R84-3] N86-29906
Thermal smoothing of rough surfaces in vacuo
[NASA-TM-88425] N86-29961
Interfacial tension of demixed polymer solutions
[DE86-003035] N86-30000
Observations of mass transport phenomena in multicomponent liquid mixtures
[DE86-006483] N86-30110
Effect of interfacial phenomena on contact line heat transfer, 1
[AD-A166088] N86-30557

INTERGRANULAR CORROSION
Microstructure, microchemistry, and microdeformation of Alloy 600 tubing
[DE86-007947] N86-29983

INTERIOR BALLISTICS
Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025

INTERMETALLICS
Theory of amorphization kinetics in intermetallics
[DE86-004858] N86-29974
Superconductivity of thin film intermetallic compounds
[AD-A166271] N86-30525

INTERMODULATION
Stable compensation of nonlinear communications systems (using Volterra systems characterization), volume 2
[AD-A165838] N86-30041

INTERNAL COMBUSTION ENGINES
Combustion in IC engines
[DE86-007846] N86-29947
Discussion of turbulent flame structure in premixed charges
[DE86-008174] N86-29948
Steady and unsteady air flow through an intake valve of a reciprocating engine
[DE86-005208] N86-30209

INTERNAL ENERGY
Improvement and optimization of internal damping of fiber reinforced composite materials
[AD-A166173] N86-29909
On the use of internal state variables in thermoviscoplastic constitutive equations N86-30231

INTERNAL FRICTION
Instability in Rotating Machinery
[NASA-CP-2409] N86-30160
Rotor internal friction instability N86-30187

INTERNATIONAL COOPERATION
Differences between Hermes, US shuttle highlighted N86-29883
Hungarian space research 1981-1985: Lectures and review articles
[NASA-TM-87992] N86-30580

INTERNATIONAL RELATIONS
Transfer of high-technology to the Soviet Union. A predicament for the US
[AD-A166469] N86-30582

INTERNATIONAL TRADE
Transfer of high-technology to the Soviet Union. A predicament for the US
[AD-A166469] N86-30582

INTERPLANETARY DUST
Trajectory determinations and collection of micrometeoroids on the space station. Report of the Workshop on Micrometeorite Capture Experiments
[NASA-CR-177303] N86-30584
Interplanetary dust: The interstellar connection N86-30587
A new instrument to measure charged and neutral cometary dust particles at low and high impact velocities N86-30590
Laser microprobe study of cosmic dust (IDPs) and potential source materials N86-30591
Laser microprobe characterization of C species in Interplanetary Dust Particles (IDP) N86-30600
The importance of capturing unmodified chondritic porous micrometeorites on the space station N86-30601

INTERPLANETARY SPACECRAFT
Manned Mars missions: A working group report
[NASA-TM-88777] N86-29873

INTERPROCESSOR COMMUNICATION
Organization of the channel-switching process in parallel computer systems based on a matrix optical switch
[NASA-TM-88452] N86-30406
Functions within the data communication layers of the ISO Open Systems Interconnection (OSI) model
[INF83/IPS/042] N86-30409
A formal description technique and the ISO transport layer --- Open Systems Interconnection
[INF83/IPS/007] N86-30410

INTERSTELLAR CHEMISTRY
Coulomb dissociation as a source of information on radiative capture processes of astrophysical interest
[KFK-4032] N86-30482

INTERSTELLAR MATTER
Interplanetary dust: The interstellar connection N86-30587
Cosmic X-ray physics
[NASA-CR-177227] N86-30624
A study of (OI) 63.2 and 145.5 micron emission from M17 and SGR A from the Lear jet
[NASA-CR-177015] N86-30625

INTRUSION
Non-intrusive speed sensor
[NASA-CR-178873] N86-30125

INVARIANCE
Lorentz invariance and the rotor Doppler shift experiments
[DE86-700614] N86-30473
Considerations about the apparent superluminal expansions in astrophysics
[DE86-701328] N86-30613

INVISCID FLOW
Calculations of axisymmetric vortex sheet roll-up using a panel and a filament model
[NASA-CR-177081] N86-29767

IODIDES
Laser studies of halogens and oxygen
[AD-A166257] N86-30477

IODINE LASERS
Laser studies of halogens and oxygen
[AD-A166257] N86-30477

ION BEAMS
Positive Ion Ejection System (PIES)
[AD-A166560] N86-29894
Phase transformations in nickel-aluminum alloys during ion beam mixing
[DE86-007519] N86-29980
Proceedings of the Second Workshop on Ion Mixing and Surface Layer Alloying
[DE86-006159] N86-30547

ION EXCHANGE MEMBRANE ELECTROLYTES
Production of an ion-exchange membrane-catalytic electrode bonded material for electrolytic cells
[NASA-TM-88392] N86-29930

ION IMPACT
Charge accumulation and arc discharges on spacecraft materials and components
[AD-A166216] N86-29893

ION IMPLANTATION
Laser induced oxidation of heavily doped silicon
[DE86-006212] N86-30153
Rapid thermal processing of ion implanted silicon as a viable solar cell technology
[DE86-008216] N86-30259
Ion implantation and laser annealing
[DE86-006226] N86-30537
Elastic and inelastic surface effects on ion penetration and the resulting sputtering and backscattering
[DE85-016604] N86-30545
Proceedings of the Second Workshop on Ion Mixing and Surface Layer Alloying
[DE86-006159] N86-30547

ION IRRADIATION
Theory of amorphization kinetics in intermetallics
[DE86-004858] N86-29974
Comparative studies of electron affinities and work functions for GaAs amd Si
[AD-A166225] N86-30523

ION SCATTERING
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292

ION SOURCES
Positive Ion Ejection System (PIES)
[AD-A166560] N86-29894

ION TEMPERATURE
Thermal ion heating in the vicinity of the plasmapause: A Dynamics Explorer guest investigation
[NASA-CR-176993] N86-30272

IONIC CRYSTALS
Pseudopotentials and structure-property relationships in the solid state
[AD-A166385] N86-30530

IONIZATION CHAMBERS
Electron-ion recombination in air at EMP fields
[AD-A166211] N86-30486

IONOSPHERE
Research and development activities of the Indian Institute of Geomagnetism N86-30274
The effect of finite Blob size on the current convective instability in the auroral ionosphere
[AD-A166806] N86-30278

IONOSPHERIC DISTURBANCES
The effect of finite Blob size on the current convective instability in the auroral ionosphere
[AD-A166806] N86-30278

IONOSPHERIC TEMPERATURE
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292

IONS
Microstructure effects on ion and electron transport parameters during passive corrosion of zircaloy
[DE86-007189] N86-29979
Thermal ion heating in the vicinity of the plasmapause: A Dynamics Explorer guest investigation
[NASA-CR-176993] N86-30272
Charge states of energetic solar particles
[MPE-195] N86-30623

IRIDIUM
Space Nuclear Safety Program
[DE86-007197] N86-30492
Space Nuclear Safety Program
[DE86-007206] N86-30493

IRON ALLOYS
Process of structure formation of sintered steel Kh6V3M
[BLL-M-36781-(5828.4)] N86-29957
Topics in precipitation and ordering reactions and their related phenomena
[DE86-007483] N86-30549

IRRADIATION
Chemically cross-linked heat-shrinkable polyethylene tubes
[AD-A166745] N86-29997
In situ high voltage electron microscope studies of ion- and electron-beam induced modification of materials
[DE86-005577] N86-30491

ISOMORPHISM
On the isomorphism between gauge groups before and after renormalization in the presence of Abel subgroups and Higgs fields
[AD-A166276] N86-30435
ITERATION
The algorithm RMS-DIIS and an ALGOL program for the B-6800 computer to diagonalize large matrices
[INPE-3878-PRE/931] N86-30372
ITERATIVE SOLUTION
Separated flows near the nose of a body of revolution
[NASA-CR-177107] N86-30091
Iterative methods for nondefinite symmetric systems, with application to a discrete Stokes problem
[ESA-86-97548] N86-30416
Investigations on improved iterative methods for solving sparse systems of linear equations
[AD-A166170] N86-30431

J

JAMMING
Data transmission by radar --- jamming resistance
[REPT-8-85] N86-30032
A comparison of methods for adaptive jamming suppression
[REPT-9-85] N86-30033
JAPAN
Japan report: Science and technology
[JPRS-JST-86-011] N86-30086
JET AIRCRAFT
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] N86-29764
JET AIRCRAFT NOISE
Sonic-boom research: Selected bibliography with annotation
[NASA-TM-87685] N86-30470
JET ENGINE FUELS
Proceedings of Fuel Safety Workshop
[DOT/FAA/PM-86/13] N86-30007
Antimisting fuel technology for transport category aircraft N86-30008
AMK full-scale transport aircraft validation phase summary N86-30009
Post Controlled Impact Demonstration (CID) analysis N86-30010
UK work on safety fuels N86-30012
Heat transfer, friction, and rheological characteristics of antimisting kerosene N86-30013
Continuous inline blending of antimisting kerosene N86-30015
Olefin polymers as jet fuel antimist additives N86-30016
AMK: Still viable? N86-30017
Safety fuels-specifications and progress N86-30018
Amine-CO2 adducts as aviation fuel gelling agents N86-30020
GTA/BASF antimisting fuel research N86-30021
Jet fuel viscosity at low temperatures with notes on n-alkaline crystals
[NASA-CR-174911] N86-30022
Antimisting kerosene: Evaluation of improved FM-9 additive
[DOT/FAA/CT-85-4] N86-30024
JET ENGINES
Effect of engine discharging jet efflux on vehicle aerodynamic performance
[AD-A166277] N86-29779
JET EXHAUST
Effect of engine discharging jet efflux on vehicle aerodynamic performance
[AD-A166277] N86-29779
JET FLOW
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] N86-29782
Effectiveness measurements for a cooling film disrupted by a single jet with wall plunging N86-29844
JET IMPINGEMENT
Full coverage impingement heat transfer: The variation in pitch to diameter ratio at a constant gapp N86-29846
JET MIXING FLOW
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] N86-29782
JOINTS (JUNCTIONS)
Feasibility study of a discrete bearing/roller drive rotary joint for the space station
[NASA-TM-88800] N86-30206
Strength characterization method for evaluating ceramic-to-metal bonds
[DE86-007526] N86-30225
JOURNAL BEARINGS
Simulation of non-linear bearing forces for post-stability investigation N86-30163
Influence of design parameters on occurence of oil whirl N86-30171
Topping turbine (103-JAT) rotor instability in 1150-STPD Kellogg ammonia plants N86-30188
Changes of instability thresholds of rotor due to bearing misalignments N86-30193
Whirl/whip demonstration N86-30195
Rotor/bearing system dynamic stiffness measurements N86-30201

KINEMATICS
MECHAN: Dynamic analysis of planar mechanisms
[DE85-018023] N86-30214
KINETIC ENERGY
Turbulent heating and transfer in the stratosphere and lower mesosphere
[AD-A166591] N86-30276
KINETICS
Electrode kinetic measurements of very fast reactions: Metal deposition-dissolution in molten halides
[DE86-006109] N86-29945
Theory of amorphization kinetics in intermetallics
[DE86-004858] N86-29974

L

LABORATORIES
Studies and experiments in the Software Engineering Lab (SEL) N86-30359
LABYRINTH SEALS
Analytical prediction of labyrinth-seal-flow-induced arotor excitation forces N86-30175
LAGRANGE MULTIPLIERS
The expanded LaGrangian system for constrained optimization problems
[NASA-CR-178142] N86-30425
LAMINAR BOUNDARY LAYER
Boundary layer stability measurements over a flat plate at mach 3
[AD-A166188] N86-29778
Calculation of laminar-turbulent boundary layer transition on turbine blades N86-29839
LAMINAR FLOW
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] N86-29772
Stability and control of compressible flows over a surface with concave-convex curvature
[NASA-CR-178143] N86-29775
LAMINAR HEAT TRANSFER
Application of rayleigh scattering to turbulent flow with heat transfer and combustion
[AD-A166223] N86-29803
LAMINATES
Effects of thermal and cyclic loads on silicon carbide yarn reinforced glass matrix composites
[DE86-006793] N86-29913
LANDFORMS
A procedure for evaluation of dust potential in desert terrains
[AD-A166491] N86-30345
LANDING GEAR
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] N86-30233
LARGE SCALE INTEGRATION
Subsystem hazard analysis for the LSI models 6216A, B and C self-contained navigation sysgem group A
[AD-A166816] N86-29807
Japan report: Science and technology
[JPRS-JST-86-011] N86-30086
Issues in LSI automation, protocol standardization N86-30087
LARGE SPACE STRUCTURES
Near-field testing of the 15-meter model of the hoop column antenna. Volume 2: Near- and far-field plots for the LaRC feeds
[NASA-CR-176060] N86-29877
ACOSS eleven (Active Control Of Space Structures) s
[AD-A165864] N86-29890
Wave propagation measurements on two-dimensional lattice
[AD-A166207] N86-29891
Failure propagation in continuum models of LSS (Large Space Structures), part 1
[AD-A166208] N86-29892
LASER ANEMOMETERS
Two spot laser velocimeter measurements of velocity and turbulence intensity in shock tube driven turbine flows N86-29853
LASER ANNEALING
Laser induced oxidation of heavily doped silicon
[DE86-006212] N86-30153
Applications of laser annealing and laser-induced diffusion to photovoltaic conversion
[DE86-003809] N86-30254
Ion implantation and laser annealing
[DE86-006226] N86-30537
LASER APPLICATIONS
Combustion in IC engines
[DE86-007848] N86-29847
Pulsed chemical laser technology development test plan single pulse diagnostic testing
[AD-A166203] N86-30140
Frequency quadrupled Nd-Yag laster for LEGS
[DE86-006130] N86-30152
Laser-assisted solar cell metallization processing
[DE86-008328] N86-30260
LASER CAVITIES
NASA Lidar system support and MOPA technology demonstration
[NASA-CR-178144] N86-30136
A high repetition rate and mode-locked phosphate glass laser
[AD-A166303] N86-30141
Dither-free stabilization of CO2 lasers for far infrared pumping: A photoacoustic approach
[DE86-007078] N86-30154
LASER CUTTING
Particles and gases produced by cutting fiber composites with a 250 W continuous wave carbon dioxide laser
[FOA-C-20599-U6] N86-29818
LASER DAMAGE
Versatile laser glass inspection and damage testing facility
[DE86-006308] N86-30502
LASER DOPPLER VELOCIMETERS
Two spot laser velocimeter measurements of velocity and turbulence intensity in shock tube driven turbine flows N86-29853
A 3-component laser-Doppler velocimeter data acquisition and reduction system
[NASA-CR-176929] N86-30135
LASER FUSION
Non-LTE atomic physics model for laser fusion and X-ray laser simulation
[DE86-006487] N86-30145
LASER GYROSCOPES
Advanced laser based inertial instrument development
[AD-A166307] N86-30128
LASER HEATING
Investigation of basic characteristics of laser heating in thermoluminescence and of laser-stimulated luminescence
[AD-A166089] N86-30139

Laser ignition studies
[DE86-008043] N86-30151
Anomalous behavior during the solidification of silicon in the presence of impurities
[DE86-007385] N86-30546
LASER INDUCED FLUORESCENCE
Optical diagnostics of gas-dynamic flows using advanced laser measurement techniques
[NASA-CR-176950] N86-30095
LASER MATERIALS
Characterization of high power flashlamps and application to Nd:glass laser pumping
[DE86-007116] N86-30155
LASER MODE LOCKING
A high repetition rate and mode-locked phosphate glass laser
[AD-A166303] N86-30141
LASER OUTPUTS
Application of rayleigh scattering to turbulent flow with heat transfer and combustion
[AD-A166223] N86-29933
Investigation of basic characteristics of laser heating in thermoluminescence and of laser-stimulated luminescence
[AD-A166089] N86-30138
LLE review, Volume 25
[DE86-008195] N86-30158
LASER PLASMA INTERACTIONS
Two dimensional analytical considerations of large magnetic and electric fields in laser produced plasmas
[DE86-00235] N86-30512
LASER PLASMAS
Two dimensional analytical considerations of large magnetic and electric fields in laser produced plasmas
[DE86-00235] N86-30512
LASER PUMPING
Pulsed chemical laser technology development test plan single pulse diagnostic testing
[AD-A166203] N86-30140
A conductively cooled laser diode array pumped laser
[AD-D012217] N86-30143
Characterization of high power flashlamps and application to Nd:glass laser pumping
[DE86-007116] N86-30155
LASER SPECTROSCOPY
Laser microprobe study of cosmic dust (IDPs) and potential source materials N86-30591
Laser microprobe characterization of C species in Interplanetary Dust Particles (IDP) N86-30600
LASER TARGETS
Ultra-low density microcellular foams
[DE86-007701] N86-30005
LASERS
Near resonant absorption by atoms in intense fluctuating laser fields
[DE86-006513] N86-30159
Versatile laser glass inspection and damage testing facility
[DE86-006306] N86-30502
LATITUDE
Latitudinal variation of DS
[INPE-3906-PRE/947] N86-30270
LATTICE PARAMETERS
Structural characterization and gas reactions of small metal particles by high-resolution, in-situ TEM and TED
[NASA-CR-176905] N86-29958
Research in Gadolinium Scandium Gallium Garnet (GSGG) crystal development
[DE86-004292] N86-30532
LATTICES (MATHEMATICS)
Dimension of binary convex structures
[IR-226] N86-30440
LAUNCHING SITES
Proceedings of the 2nd Annual Conference on NASA/University Advanced Space Design Program
[NASA-TM-89399] N86-29888
LAYOUTS
On-line design rule checker — (V)LSI chips
[ESA-86-97529] N86-30403
LEADING EDGES
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] N86-29772
Flap-lag-torsional dynamics of helicopter rotor blades in forward flight
[NASA-CR-176976] N86-29810
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-86265] N86-29813
Local and mean heat transfer on the leading and trailing surfaces of a square-sectioned duct rotating in the orthogonal-mode N86-29828
Effects of wakes on the heat transfer in gas turbine cascades N86-29829
Experimental results of the control of a vortical flow by tangential blowing
[NASA-CR-176932] N86-30094
LEAST SQUARES METHOD
On realizations of least-squares estimation and Kalman filtering by systolic arrays N86-30072
LEE WAVES
Perturbations of the Richardson number field by gravity waves
[NASA-CR-176910] N86-30273
LEGENDRE FUNCTIONS
Counting numbers representable as sums of two squares
[LUT-MR-1180] N86-30418
Computational efficiency study of a semi-analytical technique for the angular integral estimation found in transfer matrix generation
[DE86-700784] N86-30462
LENGTH
Plasma nitriding of metallic surfaces
[LP-211] N86-29984
LENS ANTENNAS
Proceedings of the 1985 Antenna Applications Symposium, volume 1
[AD-A166754] N86-30048
LIAPUNOV FUNCTIONS
Lyapunov stability of ideal compressible and incompressible fluid equilibria in three dimensions
[DE86-003648] N86-30107
LIBRARIES
Translation table for DOE/OSTI - COSATI bibliographic records to MARC format records
[DE86-006473] N86-30576
LIE GROUPS
Approximations of nonlinear systems having outputs
[NASA-CR-176946] N86-30417
LIFE (DURABILITY)
Increase of life of threaded joints of tube couplings in oil pipeline range through use of anticorrosion coatings
[BLL-M-36718-(5828.4)] N86-29987
Background review on compressors for gas engine-driven heat pumps
[PB86-201175] N86-30220
LIFE SCIENCES
Life Sciences Space Station planning document: A reference payload for the Life Sciences Research Facility
[NASA-TM-89188] N86-30302
Institutional supporting research and development, 1985
[DE86-008580] N86-30583
LIFE SUPPORT SYSTEMS
Manned Mars missions: A working group report
[NASA-TM-88777] N86-29873
Toward a permanent lunar settlement in the coming decade: the Columbus Project
[DE86-006709] N86-29874
LIFT
Influence of the angle of attack and flutter on the lift of a supercritical wing. Comparison between theory and experiment
[ONERA-RT-24/3064-RY-044-R] N86-29786
Models and prediction of turbulent flow with suspended particles
[ONERA-RT-22/7135-EY] N86-30122
LIFT AUGMENTATION
Experimental results of the control of a vortical flow by tangential blowing
[NASA-CR-176932] N86-30094
LIFT DEVICES
Magnus effect: An overview of its past and future practical applications, 1850-1985, volumes 1 and 2
[AD-A165902] N86-30102
LIGHT (VISIBLE RADIATION)
On experiments to detect possible failures of relativity theory
[DE86-700613] N86-30560
LIGHT EMITTING DIODES
A fast high power light pulse generator — flash photography
[MPIS-18/1985] N86-30085
A conductively cooled laser diode array pumped laser
[AD-D012217] N86-30143
LIGHT SOURCES
Reactive augmented combustion
[AD-A166185] N86-29932
LIGHT SPEED
Fundamental relativistic solution for the railgun
[AD-A166607] N86-30467
LIGHT TRANSMISSION
On experiments to detect possible failures of relativity theory
[DE86-700613] N86-30560
LIMITER CIRCUITS
Monolithic low noise amplifier with limiting — application to Global Positioning System receivers
[AD-D012225] N86-30076
LIMITS (MATHEMATICS)
A codimension two bifurcation with a third order Picard-Fuchs equation
[IR-249] N86-30443
LINEAR ACCELERATORS
High average power induction accelerators
[DE86-005288] N86-30488
LINEAR ARRAYS
A review of phase-only sidelobe nulling investigations at RADC (Rome Air Development Center)
[AD-A166602] N86-30045
Evaluation of selected detector arrays for space applications
[NASA-CR-176979] N86-30124
New acousto-optical beam former — for linear antenna arrays
[BMFT-FB-T-85-154] N86-30504
LINEAR EQUATIONS
Iterative methods for nondefinite symmetric systems, with application to a discrete Stokes problem
[ESA-86-97548] N86-30416
Investigations on improved iterative methods for solving sparse systems of linear equations
[AD-A166170] N86-30431
Piecewise analytical perturbation series methods for solving linear ordinary differential equations. Part 2: The radial Schroedinger equations
[DE86-700606] N86-30438
LINEAR PROGRAMMING
The Steiner tree problem. Linear programming model and decomposition technique resolution
[ENST-85E010] N86-30394
LINEAR SYSTEMS
Introduction to robust multivariable control
[AD-A165891] N86-29869
On substructuring algorithms and solution techniques for the numerical approximation of partial differential equations
[NASA-CR-178122] N86-30425
Asymptotic methods for the analysis, estimation and control of stochastic dynamic systems
[AD-A166234] N86-30434
The output of linear systems to quasipolynomial inputs
[AD-A166740] N85-30437
State estimation and parameter identification of linear and semilinear distributed parameter systems
[INPE-3904-PRE/945] N86-30455
LINEARITY
Confidence regions for variance components in unbalanced mixed linear models
[AD-A165841] N86-30428
Tail behavior for the suprema of Gaussian processes with a view towards empirical processes
[AD-A166151] N86-30461
LINEARIZATION
Approximations of nonlinear systems having outputs
[NASA-CR-176946] N86-30417
LININGS
Cooling techniques for turbojet pre-heater channels N86-29847
LINKAGES
Safety recommendation
[NTSB-A-86-22] N86-29790
LIOUVILLE EQUATIONS
An efficient method for solving quantum Liouville equation: Applications to electronic absorption spectroscopy
[AD-A166260] N86-29935
LIQUID FUELS
Observations of mass transport phenomena in multicomponent liquid mixtures
[DE86-006483] N86-30110
LIQUID INJECTION
Experimental study of chemical alleviation for improving reentry communication
[AD-A165862] N86-30042
LIQUID LITHIUM
Corrosion of vanadium and the alloy V 3Ti 1Si in flowing lithium
[KFK-4006] N86-29986
LIQUID METALS
Hydrodynamics and heat transfer in a liquid film under the end of a rotating cylinder
[BLL-M-36755-(5828.4)] N86-30088
Modeling of transient heat pipe operation
[NASA-CR-177143] N86-30099
Technical issues and requirements of experiments and facilities for fusion nuclear technology, FINESSE phase 1, volume 2
[DE86-006503] N86-30511

LIQUIDS
Electronic spectra of various liquids under shock conditions
[AD-A166510] N86-29936
LISSAJOUS FIGURES
Orbits: Computer simulation N86-30203
LITHIUM ALLOYS
Cryogenic mechanical properties of Al-Cu-Li-Zr alloy 2090
[DE86-006285] N86-29976
LITHIUM COMPOUNDS
Investigation of alternative MCFC cathode materials at Argonne National Laboratory
[DE86-005576] N86-30081
LITHIUM NIOBATES
A study of group-type single-phase unidirectional SAW transducers on LiNbO3 and quartz --- bandpass filters
[AD-A165670] N86-30067
LITHOGRAPHY
Spin-coated amorphous chalcogenide resists spin-coated amorphous chalcogenide glasses
[AD-A166270] N86-29991
LOAD TESTING MACHINES
Fatigue test machine
[AD-D012232] N86-30133
LOAD TESTS
Instability in Rotating Machinery
[NASA-CP-2409] N86-30160
Full load shop testing of 18,000-hp gas turbine driven centrifugal compressor for offshore platform service: Evaluation of rotor dynamics performance N86-30161
Mechanical properties of multi-year sea ice. Phase 2: Test results
[AD-A166333] N86-30299
LOADING MOMENTS
Instability analysis procedure for 3-level multi-bearing rotor-foundation systems N86-30162
LOADS (FORCES)
A modified microbonding test for direct in-situ fiber/matrix bond strength determination in fiber composites
[MIT-RR-R84-3] N86-29906
Simulation of non-linear bearing forces for post-stability investigation N86-30163
A comparison of current models for nonlinear rate-dependent material behavior of crystalline solids N86-30232
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] N86-30233
LOGIC CIRCUITS
Macromodeling and optimization of digital MOS VLSI circuits
[AD-A166658] N86-30075
LOGIC DESIGN
Exception handling constructs considered unnecessary --- computer programming
[INF-84-8] N86-30401
LONG DURATION SPACE FLIGHT
Study of onboard expert systems to augment space shuttle and space station autonomy
[NASA-CR-176958] N86-29886
The temporal response of bone to unloading
[NASA-TM-89228] N86-30303
LONG TERM EFFECTS
The temporal response of bone to unloading
[NASA-TM-89228] N86-30303
Multiparameter data acquisition systems for studies of Circadian rhythms
[DE86-004041] N86-30308
LONGITUDE
Longitudinal difference in the Sq profiles in the South American region
[INPE-3944-PRE/966] N86-30271
LOOPS
Pointing alignment by orthogonal phase-lock feedback loops
[DE86-006707] N86-30082
LOSSY MEDIA
A simple circular-polarized antenna: Circular waveguide horn coated with lossy magnetic material
[NASA-CR-177092] N86-30039
LOW ASPECT RATIO
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins N86-29827
LOW NOISE
Low phase noise two port voltage controlled oscillator
[AD-D012234] N86-30077
LOW PRESSURE
Selective low-pressure silicon epitaxy
[BMFT-FB-T-85-133] N86-30553
LOW TEMPERATURE
Cryogenic mechanical properties of Al-Cu-Li-Zr alloy 2090
[DE86-006285] N86-29976
Jet fuel viscosity at low temperatures with notes on n-alkaline crystals
[NASA-CR-174911] N86-30022
LOW TEMPERATURE ENVIRONMENTS
Blasting and blast effects in cold regions. Part 1: Air blast
[AD-A166315] N86-30104
LUBRICATION
Backward whirl in a simple rotor supported on hydrodynamic bearings N86-30172
LUMINESCENCE
Charge accumulation and arc discharges on spacecraft materials and components
[AD-A166216] N86-29893
The effect of background luminance and ambient illumination on color discrimination in a CRT display
[AD-A166297] N86-30496
LUNAR BASES
Toward a permanent lunar settlement in the coming decade: the Columbus Project
[DE86-006709] N86-29874
LUNAR LOGISTICS
Toward a permanent lunar settlement in the coming decade: the Columbus Project
[DE86-006709] N86-29874
LUNAR SURFACE
Proceedings of the 2nd Annual Conference on NASA/University Advanced Space Design Program
[NASA-TM-89399] N86-29888

M

MACH NUMBER
External heat transfer study on a HP turbine rotor blade N86-29828
MACHINING
Investigation of surface strains in fir tree turbine blade attachments
[AD-A166330] N86-29821
Criteria for the choice of work pieces for conventional or Numerical-Control (NC) manufacturing (turning, drilling, and cutting)
[JUEL-SPEZ-338] N86-30030
MAGNESIUM
Nondestructive evaluation of metal matrix composites
[AD-A166774] N86-29911
MAGNETIC BEARINGS
Magnetic bearings for vibration control N86-30185
Active magnetic bearings for optimum turbomachinery design N86-30186
MAGNETIC COILS
Field calculations of axisymmetric current coils in vacuum
[ESA-86-97547] N86-30058
MAGNETIC CONTROL
Magnetic bearings for vibration control N86-30185
MAGNETIC EFFECTS
The magnetic effects of shallow water internal solitons
[AD-A165852] N86-30297
MAGNETIC FIELDS
Research and development activities of the Indian Institute of Geomagnetism N86-30274
The REBATRON as a high energy accelerator
[AD-A166624] N86-30487
Two dimensional analytical considerations of large magnetic and electric fields in laser produced plasmas
[DE86-00235] N86-30512
MAGNETIC INDUCTION
High average power induction accelerators
[DE86-005288] N86-30488
MAGNETIC MATERIALS
A simple circular-polarized antenna: Circular waveguide horn coated with lossy magnetic material
[NASA-CR-177092] N86-30039
MAGNETIC PROBES
Non-intrusive speed sensor
[NASA-CR-178873] N86-30125
MAGNETIC PROPERTIES
Superconductivity of thin film intermetallic compounds
[AD-A166271] N86-30525
MAGNETIC STORAGE
Digital magnetic tape mass memory store
[BMFT-FB-T-85-151] N86-30356
MAGNETIC STORMS
Latitudinal variation of DS
[INPE-3906-PRE/947] N86-30270
MAGNETOHYDRODYNAMIC GENERATORS
An investigation of discharge structures in the submillimeter band in an MHD generator
[VDF-NT-84-16] N86-30516
MAGNETOHYDRODYNAMIC STABILITY
The effect of finite Blob size on the current convective instability in the auroral ionosphere
[AD-A166806] N86-30278
MAGNETOSPHERE
Latitudinal variation of DS
[INPE-3906-PRE/947] N86-30270
MAGNUS EFFECT
Magnus effect: An overview of its past and future practical applications, 1850-1985, volumes 1 and 2
[AD-A165902] N86-30102
MAINTENANCE
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] N86-29806
Human factors activities in teleoperator development at the Oak Ridge National Laboratory
[DE86-005160] N86-30340
MALFUNCTIONS
Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025
MAN MACHINE SYSTEMS
The computer-aided analytic process model. Operations handbook for the analytic process model demonstration package
[AD-A166180] N86-30381
A browser for directed graphs
[AD-A166622] N86-30383
MANAGEMENT INFORMATION SYSTEMS
DEASEL: An expert system for software engineering N86-30361
MANAGEMENT METHODS
Database assessment of pollution control in the military explosives and propellants production industry
[AD-A165853] N86-30264
Records, documentation storage and retrieval system, phase 2
[DE86-007219] N86-30577
MANGANESE
Nucleation of allotropic phases during pulsed laser annealing of manganese
[DE86-004584] N86-29973
Cryogenic mechanical properties of high-manganese steel weldments
[DE86-005219] N86-30212
MANGANESE COMPOUNDS
Investigation of alternative MCFC cathode materials at Argonne National Laboratory
[DE86-005576] N86-30081
MANNED SPACE FLIGHT
Manned Mars missions: A working group report
[NASA-TM-88777] N86-29873
MANNED SPACECRAFT
Manned Mars missions: A working group report
[NASA-TM-88777] N86-29873
MANUFACTURING
Some tentative ideas on developing our low-alloy and alloy steel
[AD-A166269] N86-29964
Issues in LSI automation, protocol standardization N86-30087
MAPPING
Dynamic remapping of parallel computations with varying resource demands
[NASA-CR-178150] N86-30379
MARANGONI CONVECTION
Observations of mass transport phenomena in multicomponent liquid mixtures
[DE86-006483] N86-30110
MARINE TECHNOLOGY
Magnus effect: An overview of its past and future practical applications, 1850-1985, volumes 1 and 2
[AD-A165902] N86-30102
MARKOV PROCESSES
Walsh-Fourier analysis of discrete-valued time series
[AD-A166139] N86-30430
The estimation of minimal polynomial coefficients and a start sequence of Markov parameters
[ESA-86-97519] N86-30445
ASSIST: User's manual
[NASA-TM-87735] N86-30447
MARS (PLANET)
Manned Mars missions: A working group report
[NASA-TM-88777] N86-29873
Proceedings of the 2nd Annual Conference on NASA/University Advanced Space Design Program
[NASA-TM-89399] N86-29888
Proceedings of the MECA Workshop on The Evolution of the Martian Atmosphere
[NASA-CR-176899] N86-30614
MASS DISTRIBUTION
Instability analysis procedure for 3-level multi-bearing rotor-foundation systems N86-30162
Shaft mode shape demonstration N86-30202
An introduction to ice in the polar oceans
[AD-A166140] N86-30298

MASS SPECTROSCOPY
Determination of relative sensitivity factors for use in spark-source mass spectrometry
[DE86-700715] N86-29942
Laser microprobe characterization of C species in Interplanetary Dust Particles (IDP) N86-30600
MATERIALS SCIENCE
Activities report of the Materials Science Center
[ESA-86-97388] N86-29903
Activities report of the Materials Science Center
[ESA-86-97389] N86-29904
MATHEMATICAL MODELS
Calculations of axisymmetric vortex sheet roll-up using a panel and a filament model
[NASA-CR-177081] N86-29767
Vortex sheet modeling with higher order curved panels
[NASA-CR-176971] N86-29770
Experimental and theoretical study of propeller spinner/shank interference
[NASA-CR-176954] N86-29773
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] N86-29801
Optimal landing of a helicopter in autorotation
[NASA-CR-177082] N86-29809
Computation of thermal radiation for gas turbine conditions N86-29841
Heat transfer in gas turbine combustors: A discussion of mathematical modeling of combustion, heat and mass transfer with emphasis on heat transfer in gas turbine combustors N86-29843
Simulation of flow and heat transfer in annular cavities between disks in turbomachinery N86-29855
Thermal smoothing of rough surfaces in vacuo
[NASA-TM-88425] N86-29961
Electromagnetic fields in 3-D for various cavity antennas and Faraday shields
[DE86-007563] N86-30054
Modeling of transient heat pipe operation
[NASA-CR-177143] N86-30099
Modeling of flow fields in oscillating droplets
[DE86-008232] N86-30119
Spectral study of turbulence. Pure rotation and introduction to mode composition
[ESA-86-97273] N86-30121
Models and prediction of turbulent flow with suspended particles
[ONERA-RT-22/7135-EY] N86-30122
Models and prediction of turbulent flow with suspended particles. Report on the work done by Rouen University in 1984-85
[ONERA-RT-23/7135-EY] N86-30123
Theory and analysis of soft X-ray laser experiments
[DE86-005177] N86-30148
Numerical simulation of gain-guided diode laser arrays
[DE86-007833] N86-30157
Integrated research in constitutive modelling at elevated temperatures, part 1
[NASA-CR-177237] N86-30227
Integrated research in constitutive modelling at elevated temperatures: Summary of the project N86-30228
Numerical considerations in the development and implementation of constitutive models N86-30229
A simple nonlinear joint model
[NASA-TM-87749] N86-30234
Thermal ion heating in the vicinity of the plasmapause: A Dynamics Explorer guest investigation
[NASA-CR-176993] N86-30272
Atmospheric, climatic and environmental research
[NASA-CR-176880] N86-30287
The computer-aided analytic process model. Operations handbook for the analytic process model demonstration package
[AD-A166100] N86-30381
Theoretical investigation of the scattering of the rotation-bending coupling, and study of intensity weakening using an optical model: Calculations for the systems H2-LiF(001) and HD-Ag(111)
[MPIS-16/1985] N86-30483
Two dimensional analytical considerations of large magnetic and electric fields in laser produced plasmas
[DE86-00235] N86-30512
Evolution of primordial gas clouds
[NASA-CR-176959] N86-30611
Preliminary development of a global 3-D magnetohydrodynamic computational model for solar wind-cometary and planetary interactions
[NASA-CR-177090] N86-30621
MATRICES (MATHEMATICS)
Some new results concerning the dynamic behavior of annular turbulent seals N86-30174
Iterative methods for nondefinite symmetric systems, with application to a discrete Stokes problem
[ESA-86-97548] N86-30416
On substructuring algorithms and solution techniques for the numerical approximation of partial differential equations
[NASA-CR-178122] N86-30425
Computational efficiency study of a semi-analytical technique for the angular integral estimation found in transfer matrix generation
[DE86-700784] N86-30462
MATRIX MATERIALS
Improvement and optimization of internal damping of fiber reinforced composite materials
[AD-A166173] N86-29909
Phenylquinoxaline resin compositions
[AD-D012230] N86-29912
Phenylquinoxaline resin monomers
[AD-D012236] N86-29998
MATRIX METHODS
ACOSS eleven (Active Control Of Space Structures) s
[AD-A165864] N86-29890
MATRIX THEORY
Investigations on improved iterative methods for solving sparse systems of linear equations
[AD-A166170] N86-30431
MAXIMUM LIKELIHOOD ESTIMATES
A simple example where the jacknife fails --- maximum likelihood estimates
[IR-256] N86-30452
MAXWELL EQUATION
Electromagnetic fields in 3-D for various cavity antennas and Faraday shields
[DE86-007563] N86-30054
MEASUREMENT
Measuring the software process and product: Lessons learned in the SEL N86-30358
MEASURING INSTRUMENTS
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129
Sensor driven robot systems testbed
[DE86-005892] N86-30412
Institutional supporting research and development, 1985
[DE86-008580] N86-30583
MECHANICAL DEVICES
MECHAN: Dynamic analysis of planar mechanisms
[DE85-018023] N86-30214
MECHANICAL PROPERTIES
Charge accumulation and arc discharges on spacecraft materials and components
[AD-A166218] N86-29893
A modified microbonding test for direct in-situ fiber/matrix bond strength determination in fiber composites
[MIT-RR-R84-3] N86-29906
Properties of spring steels hardened in polymer-bearing medium
[BLL-M-36734-(5828.4)] N86-29952
Connection of high-temperature strength and structural state of steel 12KhIMF with parameters of signals of acoustic emission under tension
[BLL-M-36736-(5828.4)] N86-29953
Microstructural formation and effects on the performance of platinum modified aluminide coatings
[AD-A166166] N86-29963
Microalloyed nickel-3/aluminum, a new medium temperature alloy
[DE86-006227] N86-29975
MMIC devices for active phased array antennas
[NASA-CR-176990] N86-30037
Cryogenic mechanical properties of high-manganese steel weldments
[DE86-005219] N86-30212
Strength characterization method for evaluating ceramic-to-metal bonds
[DE86-007526] N86-30225
An introduction to ice in the polar oceans
[AD-A166140] N86-30298
Mechanical properties of multi-year sea ice. Phase 2: Test results
[AD-A166333] N86-30299
MEDICAL ELECTRONICS
Specifications Physiological Monitoring System
[NASA-CR-171926] N86-30339
MEDICAL EQUIPMENT
Specifications Physiological Monitoring System
[NASA-CR-171926] N86-30339
MELLIN TRANSFORMS
The Mellin transform filter: A computer generated hologram
[AD-A166191] N86-30127
MELTING
Solidification dynamics and microstructure of metals in pulsed laser irradiation
[DE86-002169] N86-29972
Resillient modulus of freez-thaw affected granular soils for pavement design and evaluation. Part 1: Laboratory tests on soils from Winchendon, Massachusetts, test sections
[FAA/PM-84/16.1] N86-30029
Anomalous behavior during the solidification of silicon in the presence of impurities
[DE86-007395] N86-30548
MELTS (CRYSTAL GROWTH)
Nucleation of allotropic phases during pulsed laser annealing of manganese
[DE86-004584] N86-29973
Investigation of oxide and fluoride hosts for blue-green lasers
[AD-A166620] N86-30142
MEMBRANES
The calculation of hydrogen diffusion through metal membranes
[JUEL-2029] N86-29985
MEMORY
Division of attention as a function of the number of steps, visual shifts, and memory load
[NASA-TM-88775] N86-30328
MEMORY (COMPUTERS)
The force on the flex: Global parallelism and portability
[NASA-CR-178161] N86-30380
Shared memory, cache, and frontwidth considerations in multifrontal algorithm development
[DE86-007245] N86-30393
MESOSPHERE
A study of NO gamma bands in the mesosphere from spacelab 1
[AD-A166852] N86-30279
MESSAGE PROCESSING
TOFACS (Technical Office Automation and Communication System) software development and enhancements for fiscal year 1983 - fiscal year 1985
[AD-A166563] N86-30352
METAL BONDING
Strength characterization method for evaluating ceramic-to-metal bonds
[DE86-007526] N86-30225
METAL FATIGUE
National Transportation Safety Board safety recommendation
[NTSB-4357/1] N86-29792
Inhibiting corrosion cracking: Crack tip chemistry and physics
[AD-A166317] N86-29966
Wind turbine fatigue considerations
[DE86-006499] N86-30257
METAL FILMS
In situ high voltage electron microscope studies of ion- and electron-beam induced modification of materials
[DE86-005577] N86-30491
Effects of 500 keV electron irradiation and subsequent annealing on 1/f noise in copper films
[DE86-002954] N86-30540
METAL MATRIX COMPOSITES
Nondestructive evaluation of metal matrix composites
[AD-A166774] N86-29911
METAL OXIDE SEMICONDUCTORS
Macromodeling and optimization of digital MOS VLSI circuits
[AD-A166658] N86-30075
Development of optimized detector/spectrophotometer technology for low background space astronomy missions
[NASA-CR-177142] N86-30609
METAL OXIDES
On the extension of the MCSCF/CI method
[NASA-CR-176933] N86-29924
A final report on the extension of the MCSCF/CI method N86-29926
METAL PARTICLES
Structural characterizaiton and gas reactions of small metal particles by high-resolution, in-situ TEM and TED
[NASA-CR-176905] N86-29958
Structural characterization and gas reactions of small metal particles by high-resolution TEM and TED
[NASA-CR-176949] N86-29959
METAL PLATES
Use of miniaturized tests to predict flow properties and estimate fracture toughness in deformed steel plates
[DE86-007644] N86-29981
METAL POWDER
Combustion synthesis of Si3N4 and AlN
[DE86-006530] N86-29940
METAL SURFACES
Studies of metal/carbon surface chemistry, September 1, 1985-November 30, 1985
[DE86-007419] N86-29915
On the extension of the MCSCF/CI method
[NASA-CR-176933] N86-29924

The nature of chemisorbed oxygen on Ni(100) and Cu(100) N86-29925
A final report on the extension of the MCSCF/CI method N86-29926
Charging and hybridization in the finite cluster model N86-29927
Plasma nitriding of metallic surfaces
[LP-211] N86-29984
Instrumentation for surface studies for novel electronics processing
[AD-A166093] N86-30520
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A166273] N86-30526
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166274] N86-30527
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166290] N86-30528
Imaging of surfaces and defects of crystals
[DE86-008302] N86-30552

METALLIZING
Laser-assisted solar cell metallization processing
[DE86-008328] N86-30260

METALLOGRAPHY
Space Nuclear Safety Program
[DE86-007206] N86-30493

METALS
Thermal smoothing of rough surfaces in vacuo
[NASA-TM-88425] N86-29961
Ultrasonic analysis of thin adhesive bonds
[DE86-006515] N86-30224
On the use of internal state variables in thermoviscoplastic constitutive equations N86-30231
A comparison of current models for nonlinear rate-dependent material behavior of crystalline solids N86-30232

METASTABLE ATOMS
Laser studies of halogens and oxygen
[AD-A166257] N86-30477
Measurement of absolute emission cross sections for extreme ultraviolet (EUV) photons in thermal collisions of metastable helium (2 sup 1 S) with neon and helium
[MPIS-14/1985] N86-30480

METEORITE CRATERS
Bilateral symmetry of circular impact structures of astroblemes
[NASA-TM-88480] N86-30616

METEOROLOGICAL PARAMETERS
Applications of satellite meteorology in support of space shuttle
[AD-A166227] N86-30288

METEOROLOGICAL SATELLITES
Applications of satellite meteorology in support of space shuttle
[AD-A166227] N86-30288
Hungarian space research 1981-1985: Lectures and review articles
[NASA-TM-87992] N86-30580

METEOROLOGICAL SERVICES
The development of agrometeorological services in Finland
[FMI-TN-31] N86-30286

METEOROLOGY
Satellites said to function well, plans revealed N86-29808
AFOSR (Air Force Office of Scientific Research) Chemical and Atmospheric Sciences Program review (29th)
[AD-A166285] N86-30289

METEOSAT SATELLITE
Imaging and sounding instruments in the spin stabilized version of the second generation Meteosat
[REPT-60/1568] N86-29899

METRIC SPACE
Closed images of topological groups
[IR-243] N86-30463
Descriptive complexity of function spaces
[IR-278] N86-30465

MICE
Effects of simulated weightlessness on meiosis, Fertilization, and early development in mice
[NASA-CR-177108] N86-30342

MICROANALYSIS
Thin-sectioning and microanalysis of individual extraterrestrial particles N86-30586
Laser microprobe study of cosmic dust (IDPs) and potential source materials N86-30591
Laser microprobe characterization of C species in Interplanetary Dust Particles (IDP) N86-30600
Capacitor-type micrometeoroid detectors N86-30606

MICROCOMPUTERS
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129

MICROCRACKS
Failure analysis and microcrack dependent discontinuum mechanics
[DE86-006710] N86-30240

MICROELECTRONICS
West Europe report: Science and technology
[JPRS-WST-86-016] N86-29882
Japan report: Science and technology
[JPRS-JST-86-011] N86-30086
Instrumentation for surface studies for novel electronics processing
[AD-A166093] N86-30520

MICROMECHANICS
Experiments and micromechanical models for creep-rupture in polymer matrix composites
[DE86-007980] N86-29916

MICROMETEORITES
Thin-sectioning and microanalysis of individual extraterrestrial particles N86-30586
Stratospheric dust collections: Valuable resources for space and atmospheric scientists N86-30596
Targeted flight opportunities with large area collectors N86-30597
Laser microprobe characterization of C species in Interplanetary Dust Particles (IDP) N86-30600
The importance of capturing unmodified chondritic porous micrometeorites on the space station N86-30601

MICROMETEOROIDS
Trajectory determinations and collection of micrometeoroids on the space station. Report of the Workshop on Micrometeorite Capture Experiments
[NASA-CR-177303] N86-30584
Thin-sectioning and microanalysis of individual extraterrestrial particles N86-30586
Prospects for an orbital determination and capture cell experiment N86-30588
Laser microprobe study of cosmic dust (IDPs) and potential source materials N86-30591
Acoustic penetration and impact detector for micrometeoroid and space debris application N86-30594
The solar maximum satellite capture cell: Impact features and orbital debris and micrometeoritic projectile materials N86-30598
The importance of capturing unmodified chondritic porous micrometeorites on the space station N86-30601
Intact capture of hypervelocity particles N86-30603
A micrometeoroid deceleration and capture experiment: Conceptual experiment design description N86-30605
Capacitor-type micrometeoroid detectors N86-30606
Precision requirements on cosmic dust trajectory measurements N86-30607

MICROPROCESSORS
Proceedings of the 1984 CERN School of Computing
[DE86-700783] N86-30355

MICROSCOPY
Investigations of creep cavitation in type 304 stainless steel
[DE86-007187] N86-29978

MICROSTRIP TRANSMISSION LINES
MMIC devices for active phased array antennas
[NASA-CR-176990] N86-30037

MICROSTRUCTURE
Carbon-rich ceramic composites from ethynyl aromatic precursors
[NASA-TM-88812] N86-29908
Properties of spring steels hardened in polymer-bearing medium
[BLL-M-36734-(5828.4)] N86-29952
Microstructural formation and effects on the performance of platinum modified aluminide coatings
[AD-A166] N86-29963
Solidification dynamics and microstructure of metals in pulsed laser irradiation
[DE86-002169] N86-29972
Microstructure effects on ion and electron transport parameters during passive corrosion of zircaloy
[DE86-007189] N86-29979
Microstructure, microchemistry, and microdeformation of Alloy 600 tubing
[DE86-007947] N86-29983
Relation between microstructural heterogeneous surface layer and nitrogen pressure during sintering in Si3N4-MI2O3 ceramics
[NASA-TM-88409] N86-29988
Chalcogenide glasses. Part 3: Chalcogenide glass-forming systems
[AD-A166592] N86-29996
A comparison of current models for nonlinear rate-dependent material behavior of crystalline solids N86-30232
Microstructural dynamics of primary and secondary recrystallization
[DE86-006046] N86-30536
Computer simulation of microstructural dynamics
[DE86-008045] N86-30541
Role of interfaces in cavity formation
[DE86-004763] N86-30543
Topics in precipitation and ordering reactions and their related phenomena
[DE86-007483] N86-30549
Structure and electrical properties of Au contacts to GaAs
[DE86-007499] N86-30550
Thin-sectioning and microanalysis of individual extraterrestrial particles N86-30586

MICROTOMY
Thin-sectioning and microanalysis of individual extraterrestrial particles N86-30586

MICROWAVE CIRCUITS
Monolithic low noise amplifier with limiting --- application to Global Positioning System receivers
[AD-D012225] N86-30076

MICROWAVE LANDING SYSTEMS
Engineering performance evaluation of small community airport microwave landing system (TI-model) at Philadelphia International Airport Runway 17
[FAA/PM-86/24] N86-29802
The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways
[AD-A166485] N86-29804
Will the USAF need ground-based air traffic control radar in the year 2000?
[AD-A166504] N86-29805

MICROWAVE PROBES
Non-intrusive speed sensor
[NASA-CR-178873] N86-30125

MICROWAVES
MMIC devices for active phased array antennas
[NASA-CR-176990] N86-30037
Adaptive microwave channelization
[AD-D012215] N86-30050
Studies on radiative collisional and ultraviolet lasers
[AD-A166193] N86-30139
High pressure electron resonance studies of electronic, magnetic and structural phase transitions
[DE85-016971] N86-30544

MILITARY HELICOPTERS
Feasibility study for ergonomic analysis and design of future helicopter cockpit systems
[NASA-CR-176942] N86-29811

MILITARY OPERATIONS
Technology transfer and artificial intelligence
[AD-A166035] N86-30581

MILITARY SPACECRAFT
Anti-satellite weapons, countermeasures, and arms control
[PB86-182953] N86-30031

MILITARY TECHNOLOGY
Scientific and technical information search and service in the research and development of military products
[AD-A166300] N86-30572
Transfer of high-technology to the Soviet Union. A predicament for the US
[AD-A166469] N86-30582

MILLIMETER WAVES
A superconducting tunnel junction receiver for millimeter-wave astronomy
[NASA-TM-87792] N86-30517

MINIMUM ENTROPY METHOD
A minimum entropy principle in the gas dynamics equations
[NASA-CR-178123] N86-30421

MIRAGE AIRCRAFT
Physical training of Mirage 2000 pilots N86-30324

MIS (SEMICONDUCTORS)
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166242] N86-30524
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166290] N86-30528

MISALIGNMENT
Changes of instability thresholds of rotor due to bearing misalignments N86-30193

MISSILE COMPONENTS
Component base flow analysis
[AD-A166283] N86-29781
Computer simulation of rocket/missile safing and arming mechanism (containing pin pallet runaway escapement, three-pass involute gear train and acceleration driven rotor)
[AD-A166667] N86-29878

MISSION PLANNING
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] N86-29764

MIXED CRYSTALS
Investigation of oxide and fluoride hosts for blue-green lasers
[AD-A166620] N86-30142
MIXING
Phase transformations in nickel-aluminum alloys during ion beam mixing
[DE86-007519] N86-29980
Continuous inline blending of antimisting kerosene N86-30015
Proceedings of the Second Workshop on Ion Mixing and Surface Layer Alloying
[DE86-006159] N86-30547
MODELS
Application of rayleigh scattering to turbulent flow with heat transfer and combustion
[AD-A166223] N86-29933
Modeling and equalization of nonlinear bandlimited satellite channels N86-30071
Selecting the best population, a decision theoretic approach: The case of Pareto distribution
[AD-A166152] N86-30449
MODULATION
Nonlinear temporal modulation of pulsar radioemission
[DE86-700670] N86-30626
MODULATION TRANSFER FUNCTION
Wave observation at sea with the Dutch Side-Looking Airborne Radar (SLAR)
[B3.533.005] N86-30063
MODULATORS
Pulse repetition modulator apparatus
[AD-D012237] N86-30079
MODULUS OF ELASTICITY
Improvement and optimization of internal damping of fiber reinforced composite materials
[AD-A166173] N86-29909
Compliance matrices for cracked bodies
[NASA-CR-179478] N86-30236
MOISTURE CONTENT
General investigations of composite materials. Adhesive bonding of carbon composites --- carbon fibers
[SNIAS-2647/DCI-PR/85] N86-29919
Aging of carbon-epoxy composite in humid environments
[PV-42-791/F] N86-29921
MOLDS
Ultra-low density microcellular foams
[DE86-007701] N86-30005
MOLECULAR ABSORPTION
Theoretical studies of chemisorption on copper nickel alloys and surface embrittlement
[DE86-007034] N86-29971
Theoretical study of the radiative and kinetic properties of selected metal oxides and air molecules
[AD-A166113] N86-30521
MOLECULAR BEAM EPITAXY
Production and properties of metallic superlattices
[DE86-003058] N86-29970
Comparative studies of electron affinities and work functions for GaAs amd Si
[AD-A166225] N86-30523
MOLECULAR BEAMS
Mean trajectory gaussian wave packet approach to rotationally inelastic molecule-surface diffraction
[AD-A166275] N86-30478
A multiple Gaussian wave packet theory of H2 diffraction and rotational excitation by collision with solid surfaces
[AD-A166291] N86-30529
MOLECULAR CLOUDS
Evolution of primordial gas clouds
[NASA-CR-176959] N86-30611
A study of (OI) 63.2 and 145.5 micron emission from M17 and SGR A from the Lear jet
[NASA-CR-177015] N86-30625
MOLECULAR COLLISIONS
A multiple Gaussian wave packet theory of H2 diffraction and rotational excitation by collision with solid surfaces
[AD-A166291] N86-30529
MOLECULAR ENERGY LEVELS
On the low-lying states of CuO N86-29928
Benchmark full configuration-interaction calculations on HF and NH2 N86-30376
MOLECULAR EXCITATION
Cluster-model calculation of raman intensity for vibration of CO adsorbed on copper
[AD-A166239] N86-29934
Theoretical studies of chemisorption on copper nickel alloys and surface embrittlement
[DE86-007034] N86-29971
Benchmark full configuration-interaction calculations on HF and NH2 N86-30376
Molecular reaction rates
[AD-A166518] N86-30479
Elementary reactions of electronically excited molecules 6. Quenching of O2(1 delta g) by amines, furanes, pyrroles, and thiophenes
[MPIS-21/1985] N86-30484
A multiple Gaussian wave packet theory of H2 diffraction and rotational excitation by collision with solid surfaces
[AD-A166291] N86-30529
MOLECULAR INTERACTIONS
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A166273] N86-30526
MOLECULAR ORBITALS
A vectorized molecule code N86-29929
Integral processing in beyond-Hartree-Fock calculations N86-30374
MOLECULAR OSCILLATIONS
Cluster-model calculation of raman intensity for vibration of CO adsorbed on copper
[AD-A166239] N86-29934
MOLECULAR ROTATION
Mean trajectory gaussian wave packet approach to rotationally inelastic molecule-surface diffraction
[AD-A166275] N86-30478
Theoretical investigation of the scattering of the rotation-bending coupling, and study of intensity weakening using an optical model: Calculations for the systems H2-LiF(001) and HD-Ag(111)
[MPIS-16/1985] N86-30483
A multiple Gaussian wave packet theory of H2 diffraction and rotational excitation by collision with solid surfaces
[AD-A166291] N86-30529
MOLECULAR STRUCTURE
Molecular dynamics of reactions forming electronically excited products
[AD-A166168] N86-29931
The influence of chemical structure on the strength of rubber
[AD-A166355] N86-29993
Small angle neutron scattering study on a polymer blend: Characterization of the deformation behavior
[DE86-006099] N86-30003
MOLECULAR WEIGHT
Fugacity and concentration gradients in a gravity field
[NASA-TM-88809] N86-30620
MOLECULES
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A166273] N86-30526
MOLTEN SALTS
Electrode kinetic measurements of very fast reactions: Metal deposition-dissolution in molten halides
[DE86-006109] N86-29945
MOMENTUM
Cosmic dust detection with large surface piezoceramics N86-30604
MOMENTUM TRANSFER
Turbulent heating and transfer in the stratosphere and lower mesosphere
[AD-A166591] N86-30276
Fundamental relativistic solution for the railgun
[AD-A166607] N86-30467
MONITORS
Division of attention as a function of the number of steps, visual shifts, and memory load
[NASA-TM-88775] N86-30328
MONOMERS
Carbon-rich ceramic composites from ethynyl aromatic precrusors
[NASA-TM-88812] N86-29908
Phenylquinoxaline resin monomers
[AD-D012236] N86-29998
Synthesis of model polymers and related structures in support of vinyl monomer grafting studies
[DE86-008204] N86-30006
MONTE CARLO METHOD
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A166273] N86-30526
Microstructural dynamics of primary and secondary recrystallization
[DE86-006046] N86-30536
MOON
Some navigation and almanac algorithms
[AD-A165840] N86-29803
Toward a permanent lunar settlement in the coming decade: the Columbus Project
[DE86-006709] N86-29874
MORPHOLOGY
An introduction to ice in the polar oceans
[AD-A166140] N86-30298
MOUNTING
Modeling of elastically mounted vertical rotor N86-30168
MULTICHANNEL COMMUNICATION
Analytical methods for characterization of nonlinear devices and networks, volume 1
[AD-A165837] N86-30040
Algorithm for segmentation of multichannel images
[AD-A166215] N86-30382
MULTIPATH TRANSMISSION
Study of multipath fading in line of sight radio links: Bibliography summary
[CRPE-NT-133] N86-30056
MULTIPLEXING
Worldwide report: Telecommunications policy, research, and development
[JPRS-TTP-86-013] N86-29897
MULTIPROCESSING (COMPUTERS)
Multiprocessor model with distributed task creation
[DE86-005302] N86-30354
Dynamic remapping of parallel computations with varying resource demands
[NASA-CR-178150] N86-30379
The force on the flex: Global parallelism and portability
[NASA-CR-178161] N86-30380
Dataflow architectures
[AD-A166235] N86-30407
MULTIVARIATE STATISTICAL ANALYSIS
Introduction to robust multivariable control
[AD-A165891] N86-29869
The output of linear systems to quasipolynomial inputs
[AD-A166740] N86-30437
MUSCLES
A possible role for endogenous glucocorticoids in orchiectomy-induced atrophy of the rat levator ani muscle: Studies with RU38486, a potent and selective antiglucocorticoid
[NASA-CR-177029] N86-30343

N

NAPHTHALENE
Graph theory in the study of metal cluster bonding topology: Applications to metal clusters having fused polyhedra
[AD-A166623] N86-29937
NASA PROGRAMS
NASA thesaurus supplement
[NASA-SP-7053-SUPP-1] N86-30569
NATURAL GAS
Geology and petroleum resources of the Barents-northern Kara shelf in light of new geologic data
[DE86-008472] N86-30247
NAVIER-STOKES EQUATION
Transonic Navier-Stokes wing solution using a zonal approach. Part 1: Solution methodology and code validation
[NASA-TM-88248] N86-29765
Pseudo-time algorithms for the Navier-Stokes equations
[NASA-CR-178127] N86-29776
Comparisons of CFD flow field solutions with experimental data at Mach 14
[DE86-004915] N86-29784
Separated flows near the nose of a body of revolution
[NASA-CR-177107] N86-30091
Numerical simulation of the flowfield over ice accretion shapes
[NASA-CR-176960] N86-30093
Incipient transition phenomena in compressible flows over a flat plate
[NASA-CR-178111] N86-30097
Navier-Stokes equations by the finite element method
[DE86-700661] N86-30108
Finite-element model in vorticity and current function for the numerical solution of the Navier-Stokes equations
[DE86-700787] N86-30109
NASA-VOF2D: a computer program for incompressible flows with free surfaces
[DE86-007195] N86-30116
NAVIGATION
Some navigation and almanac algorithms
[AD-A165840] N86-29803
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] N86-29806
Subsystem hazard analysis for the LSI models 6216A, B and C self-contained navigation sysgem group A
[AD-A166816] N86-29807
A description of prediction errors associated with the T-Bus-4 navigation message and a corrective procedure
[NOAA-TM-NESDIS-16] N86-29875
Robotics applications on an advanced hypercube multiprocessor: initial developments
[DE86-008237] N86-30218

NAVIGATORS
Sensitivity to color contrasts and the selection of navigator personnel N86-30318
NAVY
Relationship of cardiopulmonary fitness to flight performance in tactical aviation N86-30326
Hypobaric training of flight personnel without compromising quality of life N86-30327
NEAR FIELDS
Research with nearfield acoustic holography
[AD-A166679] N86-30130
Noise predictions of a high bypass turbofan engine using the Lockheed Near-Field Noise Prediction Program
[NASA-CR-178146] N86-30469
NEEDLES
Scanning electron microscope study of nitroguanidine, M31A1 and m30 propellants
[AD-A166669] N86-30027
NEGATIVE IONS
The influence of negative ions on the incoherent diffusion of electromagnetic waves in the D region of the ionosphere
[AERONOMICA-ACTA-A-302-1985] N86-30269
NEODYMIUM
Spectroscopic, optical and thermo-mechanical properties of GSGG and its laser performance
[DE86-005773] N86-30156
NEODYMIUM LASERS
Development of a solid state laser of Nd:YLF
[DE86-700770] N86-30147
LLE review, Volume 25
[DE86-008195] N86-30158
NEON
Measurement of absolute emission cross sections for extreme ultraviolet (EUV) photons in thermal collisions of metastable helium (2 sup 1 S) with neon and helium
[MPIS-14/1985] N86-30480
NETHERLANDS
Simplified examinations of the aerodynamic performances of tip vane rotors
[NLR-M-AT-84-007-L] N86-29787
Estimate of the aerodynamic performances of tip vane rotors using the Helix program
[NLR-TR-85027-L] N86-29788
Aerodynamic research on tip vane rotors, carried out by NLR, and a rough evaluation of the tip vane concept
[NLR-TR-85064-L] N86-29789
NETWORK ANALYSIS
A note on the evaluation of the mean value scheme for closed multichain queueing networks
[MEMO-COSOR-84-04] N86-30460
NETWORK CONTROL
Round robin scheduling for fair flow control in data communication networks
[AD-A166726] N86-30047
NEUTRON DIFFRACTION
Small angle neutron scattering study on a polymer blend: Characterization of the deformation behavior
[DE86-006099] N86-30003
NEUTRON SCATTERING
Small angle neutron scattering study on a polymer blend: Characterization of the deformation behavior
[DE86-006099] N86-30003
NICKEL
The nature of chemisorbed oxygen on Ni(100) and Cu(100) N86-29925
Phase transformations in nickel-aluminum alloys during ion beam mixing
[DE86-007519] N86-29980
NICKEL ALLOYS
Mechanism of stress-corrosion cracking of Alloy X-750 in high purity water
[DE86-006361] N86-29969
Theoretical studies of chemisorption on copper nickel alloys and surface embrittlement
[DE86-007034] N86-29971
Theory of amorphization kinetics in intermetallics
[DE86-004858] N86-29974
Microalloyed nickel-3/aluminum, a new medium temperature alloy
[DE86-006227] N86-29975
NICKEL OXIDES
Point defects and high-temperature deformation of NiO
[DE86-005560] N86-30534
NIGHT SKY
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292
NIOBIUM ALLOYS
Flux pinning by grain boundaries in A15 superconductors
[DE86-006250] N86-30538
NITRIDES
Development of accurate estimation methods for calculating heat capacities of refractory materials
[DE86-004242] N86-30559
NITRIDING
Plasma nitriding of metallic surfaces
[LP-211] N86-29984
NITROGEN
Relation between microstructural heterogeneous surface layer and nitrogen pressure during sintering in Si3N4-MI2O3 ceramics
[NASA-TM-88409] N86-29988
Molecular reaction rates
[AD-A166518] N86-30479
NITROGEN OXIDES
A study of NO gamma bands in the mesosphere from spacelab 1
[AD-A166852] N86-30279
NITROGUANIDINE
Scanning electron microscope study of nitroguanidine, M31A1 and m30 propellants
[AD-A166669] N86-30027
NITROUS OXIDES
Data collection and analysis for HCl, SO2, and NO2 immission-emission differential absorption lidars
[GKSS-85/E/53] N86-30268
NOAA SATELLITES
A description of prediction errors associated with the T-Bus-4 navigation message and a corrective procedure
[NOAA-TM-NESDIS-16] N86-29875
NOISE MEASUREMENT
Investigation of the aerodynamic performance and noise characteristics of a 1/5th scale model of the Dowty Rotol R212 propeller
[RAE-TM-AERO-1983] N86-30468
A new version of the helicopter aural detection program, ICHIN
[NASA-TM-87745] N86-30471
NOISE PREDICTION (AIRCRAFT)
Noise predictions of a high bypass turbofan engine using the Lockheed Near-Field Noise Prediction Program
[NASA-CR-178146] N86-30469
NOISE SPECTRA
Multichannel relative-entropy spectrum analysis
[AD-A166625] N86-30046
NONDESTRUCTIVE TESTS
Nondestructive evaluation of metal matrix composites
[AD-A166774] N86-29911
Cracked shaft detection on large vertical nuclear reactor coolant pump N86-30180
NONISENTROPICITY
An entropy correction method for unsteady full potential flows with strong shocks
[NASA-TM-87769] N86-29777
NONLINEAR EQUATIONS
Control of nonlinear systems using fixed point theorems
[INPE-3923-PRE/957] N86-30454
NONLINEAR PROGRAMMING
One-parameter families of optimization problems: Equality constraints
[ESA-86-97357] N86-30444
NONLINEAR SYSTEMS
Analytical methods for characterization of nonlinear devices and networks, volume 1
[AD-A165837] N86-30040
Stable compensation of nonlinear communications systems (using Volterra systems characterization), volume 2
[AD-A165838] N86-30041
Nonlinear theory of the free-electron laser
[DE86-700668] N86-30146
A canonical form for nonlinear systems
[NASA-CR-176974] N86-30371
Approximations of nonlinear systems having outputs
[NASA-CR-176946] N86-30417
Use of a virtual control approach in state estimation
[INPE-3903-PRE/944] N86-30453
Control of nonlinear systems using fixed point theorems
[INPE-3923-PRE/957] N86-30454
State estimation and parameter identification for semilinear distributed parameter systems
[INPE-3932-PRE/964] N86-30456
Control of nonlinear distributed parameter systems using fixed point techniques
[INPE-3922-PRE/956] N86-30457
Nonlinear effects in long range underwater acoustic propagation
[AD-A166492] N86-30472
Nonlinear temporal modulation of pulsar radioemission
[DE86-700670] N86-30626
NONLINEARITY
Modeling and equalization of nonlinear bandlimited satellite channels N86-30071
A simple nonlinear joint model
[NASA-TM-87749] N86-30234
NORTH AMERICA
Impact of CO2 on the climate change in North America during the 20th century
[DE86-006126] N86-30286
NOSE WHEELS
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] N86-30233
NOZZLES
Studies of heat transfer on the base of turbine nozzles with and without film cooling N86-29834
NUCLEAR EXPLOSION EFFECT
Blasting and blast effects in cold regions. Part 1: Air blast
[AD-A166315] N86-30104
NUCLEAR FUEL REPROCESSING
Human factors activities in teleoperator development at the Oak Ridge National Laboratory
[DE86-005160] N86-30340
NUCLEAR FUELS
Review of fracture properties of nuclear materials determined by Hertzian indentation
[DE86-005520] N86-30238
NUCLEAR FUSION
Coulomb dissociation as a source of information on radiative capture processes of astrophysical interest
[KFK-4032] N86-30482
Evolution of primordial gas clouds
[NASA-CR-176959] N86-30611
NUCLEAR PHYSICS
Basic elements of nuclear geophysics
[DE86-700735] N86-30243
NUCLEAR POWER PLANTS
Hydrogen-combustion analyses of large-scale tests
[DE86-004722] N86-29944
NUCLEAR PUMPING
Critical review of gamma-ray laser proposals
[DE86-006020] N86-30144
NUCLEAR REACTORS
Cutting of metal components by intergranular cracking
[DE86-006949] N86-30213
NUCLEAR STRUCTURE
Nuclear structure properties for gamma-ray lasers
[DE86-006027] N86-30150
NUCLEATION
Microstructural dynamics of primary and secondary recrystallization
[DE86-006046] N86-30536
Role of interfaces in cavity formation
[DE86-004763] N86-30543
Stability of surface nucleation
[NASA-TM-88806] N86-30556
NUCLEI (NUCLEAR PHYSICS)
Nuclear structure properties for gamma-ray lasers
[DE86-006027] N86-30150
Cross section calculations for subthreshold pion production in peripheral heavy-ion collisions
[NASA-TP-2600] N86-30485
NULL ZONES
A review of phase-only sidelobe nulling investigations at RADC (Rome Air Development Center)
[AD-A166602] N86-30045
NUMERICAL ANALYSIS
Mean trajectory gaussian wave packet approach to rotationally inelastic molecule-surface diffraction
[AD-A166275] N86-30478
NUMERICAL CONTROL
Criteria for the choice of work pieces for conventional or Numerical-Control (NC) manufacturing (turning, drilling, and cutting)
[JUEL-SPEZ-338] N86-30030
Intelligent N/C controllers
[DE86-003132] N86-30387
NUMERICAL INTEGRATION
Integrated research in constitutive modelling at elevated temperatures, part 1
[NASA-CR-177237] N86-30227
Integrated research in constitutive modelling at elevated temperatures: Summary of the project N86-30228
Evaluation of the numerical stability and sensitivity of material parameter variations for several unified constitutive models
[MM-4998-85-6-PT-1] N86-30230
NUMERICAL STABILITY
Evaluation of the numerical stability and sensitivity of material parameter variations for several unified constitutive models
[MM-4998-85-6-PT-1] N86-30230

O

OBLIQUE WINGS
Model-following control for an oblique-wing aircraft
[NASA-TM-88269] N86-29867
Eigensystem synthesis for active flutter suppression on an oblique-wing aircraft
[NASA-TM-88275] N86-29868
OBSERVABILITY (SYSTEMS)
Approximations of nonlinear systems having outputs
[NASA-CR-176946] N86-30417
OBSERVATORIES
A digital filter for removing known components from spectroscopic data
[AD-A166680] N86-30385
OCCULTATION
Occultation of the ATS-3 satellite by the AVEFRIA barium ion cloud
[DE86-008346] N86-30282
OCEAN BOTTOM
The stability of low-latitude sea-surface temperatures: An evaluation of the CLIMAP reconstruction with emphasis on the positive SST anomalies
[DE85-016190] N86-30300
OCEAN MODELS
Pandora: An eleven-box geochemical model of the world ocean
[DE86-005172] N86-30265
Nonlinear effects in long range underwater acoustic propagation
[AD-A166492] N86-30472
OCEAN SURFACE
Wave observation at sea with the Dutch Side-Looking Airborne Radar (SLAR)
[B3.533.005] N86-30063
OCEAN THERMAL ENERGY CONVERSION
Composite turbine blade design options for Claude (open) cycle OTEC power systems
[DE85-016876] N86-30215
OCEANS
An introduction to ice in the polar oceans
[AD-A166140] N86-30298
OCULOMOTOR NERVES
Computer analysis of visual and vestibular oculomotor function in the medical selection of fighter aircrew members N86-30319
OIL RECOVERY
Crystalline surfactant dispersions by radio frequency absorption
[DE86-000267] N86-30551
OILS
Influence of design parameters on occurence of oil whirl N86-30171
Oil seal effects and subsynchronous vibrations in high-speed compressors N86-30176
Measuring dynamic oil film coefficients of sliding bearing N86-30179
Demonstration of various rotor instabilities (exhibit of Bently Rotor Dynamics Research Corporation Laboratories at symposium on instability in rotating machinery) N86-30194
ON-LINE SYSTEMS
On-line design rule checker --- (V)LSI chips
[ESA-86 97529] N86-30403
OPERATING SYSTEMS (COMPUTERS)
Optimization of an interactive distributive computer network
[NASA-CR-177373] N86-30405
Protection and resource control in distributed operating systems
[IR-79] N86-30408
OPERATIONS RESEARCH
Valid inequalities for mixed 0-1 problems --- operations research
[ESA-86-97305] N86-30459
OPERATORS (MATHEMATICS)
Preconditioning for first-order spectral discretization
[NASA-TM-87619] N86-30427
State estimation and parameter identification of linear and semilinear distributed parameter systems
[INPE-3904-PRE/945] N86-30455
OPHTHALMOLOGY
Sensitivity to color contrasts and the selection of navigator personnel N86-30318
OPTICAL COMPUTERS
Organization of the channel-switching process in parallel computer systems based on a matrix optical switch
[NASA-TM-88452] N86-30406
OPTICAL DATA PROCESSING
Evaluation of selected detector arrays for space applications
[NASA-CR-176979] N86-30124
OPTICAL DISKS
Micro mushroom instrumentation system
[AD-D012235] N86-30078
OPTICAL EQUIPMENT
NASA Lidar system support and MOPA technology demonstration
[NASA-CR-178144] N86-30136
Ferroelectric tungsten bronze crystals for far infrared electro-optic device applications
[AD-A166484] N86-30531
OPTICAL FILTERS
Chalcogenide glasses. Part 2: Optical thickness temperature relation in chalcogenide glass films
[AD-A166589] N86-29995
Chalcogenide glasses. Part 3: Chalcogenide glass-forming systems
[AD-A166592] N86-29996
The effect of spectrally selective filters on visual search performance
[AD-A165835] N86-30329
Criteria for selection of graded index filter materials based on an analysis of wave propagation in a periodic medium
[AD-A166309] N86-30498
OPTICAL MEASUREMENT
An optical pyrometer to measure turbine blade surface temperature N86-29849
Orbital debris measurements N86-30593
OPTICAL PATHS
Study of multipath fading in line of sight radio links: Bibliography summary
[CRPE-NT-133] N86-30056
A high repetition rate and mode-locked phosphate glass laser
[AD-A166303] N86-30141
Acta Optica Sinica (selected articles)
[AD-A166281] N86-30495
OPTICAL PROPERTIES
Spin-coated amorphous chalcogenide resists spin-coated amorphous chalcogenide glasses
[AD-A166270] N86-29991
Spectroscopic, optical and thermo-mechanical properties of GSGG and its laser performance
[DE86-005773] N86-30156
Preparation and optical properties of GA(x)IN(1-x)P alloys
[NASA-TM-88431] N86-30518
Pseudopotentials and structure-property relationships in the solid state
[AD-A166385] N86-30530
Ferroelectric tungsten bronze crystals for far infrared electro-optic device applications
[AD-A166484] N86-30531
OPTICAL PUMPING
Development of a solid state laser of Nd:YLF
[DE86-700770] N86-30147
Characterization of high power flashlamps and application to Nd:glass laser pumping
[DE86-007116] N86-30155
OPTICAL PYROMETERS
An optical pyrometer to measure turbine blade surface temperature N86-29849
Laser ignition studies
[DE86-006043] N86-30151
OPTICAL RADAR
NASA Lidar system support and MOPA technology demonstration
[NASA-CR-178144] N86-30136
Data collection and analysis for HCl, SO2, and NO2 immission-emission differential absorption lidars
[GKSS-85/E/53] N86-30268
Remote measurement of tropospheric parameters by lidar --- pollution monitoring
[GKSS-85/E/50] N86-30283
OPTICAL RESONANCE
Near resonant absorption by atoms in intense fluctuating laser fields
[DE86-008513] N86-30159
OPTICAL SWITCHING
Fiber optic rotary switching device
[AD-D012231] N86-30499
OPTICAL THICKNESS
An introduction to ice in the polar oceans
[AD-A166140] N86-30298
OPTIMAL CONTROL
Optimal landing of a helicopter in autorotation
[NASA-CR-177082] N86-29809
Adaptive control of first-order systems with time-delay
[ER-84/05] N86-30415
Use of a virtual control approach in state estimation
[INPE-3903-PRE/944] N86-30453
OPTIMIZATION
Macromodeling and optimization of digital MOS VLSI circuits
[AD-A166658] N86-30075
The Steiner tree problem. Linear programming model and decomposition technique resolution
[ENST-85E010] N86-30394
The expanded LaGrangian system for constrained optimization problems
[NASA-CR-178142] N86-30426
One-parameter families of optimization problems: Equality constraints
[ESA-86-97357] N86-30444
Valid inequalities for mixed 0-1 problems --- operations research
[ESA-86-97305] N86-30459
Critical sets in parametric optimization
[ESA-86-97358] N86-30466
ORBIT CALCULATION
Use of a virtual control approach in state estimation
[INPE-3903-PRE/944] N86-30453
ORBIT TRANSFER VEHICLES
Theoretical research program to study chemical reactions in AOTV bow shock tubes
[NASA-CR-176992] N86-30373
ORBITAL MECHANICS
Analysis of dynamical systems
[AD-A166224] N86-30433
ORBITAL POSITION ESTIMATION
A description of prediction errors associated with the T-Bus-4 navigation message and a corrective procedure
[NOAA-TM-NESDIS-16] N86-29875
ORBITAL SERVICING
Dust collection on serviceable satellites N86-30599
ORBITAL SPACE STATIONS
Proceedings of the 2nd Annual Conference on NASA/University Advanced Space Design Program
[NASA-TM-39399] N86-29888
Trajectory determinations and collection of micrometeoroids on the space station. Report of the Workshop on Micrometeorite Capture Experiments
[NASA-CR-177303] N86-30584
The importance of capturing unmodified chondritic porous micrometeorites on the space station N86-30601
Space station N86-30602
ORBITS
Prospects for an orbital determination and capture cell experiment N86-30588
ORDER-DISORDER TRANSFORMATIONS
Local density theory of heats of formation and short-range order parameters in substitutionally disordered alloys
[DE86-007979] N86-29982
Theory of electronic states in disordered alloy hydrides
[DE86-006260] N86-30539
Topics in precipitation and ordering reactions and their related phenomena
[DE86-007483] N86-30549
ORDNANCE
Computer simulation of rocket/missile safing and arming mechanism (containing pin pallet runaway escapement, three-pass involute gear train and acceleration driven rotor)
[AD-A166667] N86-29878
ORGANIC MATERIALS
Electronic spectra of various liquids under shock conditions
[AD-A166510] N86-29936
OSCILLATIONS
Evidence of nonuniqueness and oscillatory solutions in computational fluid mechanics
[DE86-006493] N86-30111
Modeling of flow fields in oscillating droplets
[DE86-008232] N86-30119
OUTGASSING
Outgassing measurement of the aluminum alloy UHV chamber
[NASA-TM-88433] N86-29962
OXIDATION
Laser induced oxidation of heavily doped silicon
[DE86-006212] N86-30153
Effects of the low Earth orbital environment on spacecraft materials N86-30595
OXIDES
Development of accurate estimation methods for calculating heat capacities of refractory materials
[DE86-004242] N86-30559
OXYGEN
The nature of chemisorbed oxygen on Ni(100) and Cu(100) N86-29925
An environmentally-controlled extended-use small animal hypobaric chamber
[AD-A166729] N86-30307
Molecular reaction rates
[AD-A166518] N86-30479
Elementary reactions of electronically excited molecules 6. Quenching of O2(1 delta g) by amines, furanes, pyrroles, and thiophenes
[MPIS-21/1985] N86-30484

Point defects and high-temperature deformation of NiO
[DE86-005560] N86-30534

OXYGEN ATOMS
Development of composite tube protective coatings
[NASA-CR-178116] N86-29969
On the electron affinity of the oxygen atom
N86-30377
Laser studies of halogens and oxygen
[AD-A166257] N86-30477
Effects of the low Earth orbital environment on spacecraft materials N86-30595

OZONE
Internal wave motion
[NASA-CR-178871] N86-30275

P

PACIFIC NORTHWEST (US)
Pacific Northwest Wind Regional Energy Assessment Program. Volume 2: Appendix
[DE86-007114] N86-30296

PACKET TRANSMISSION
Round robin scheduling for fair flow control in data communication networks
[AD-A166728] N86-30047

PALLADIUM
Structural characterization and gas reactions of small metal particles by high-resolution, in-situ TEM and TED
[NASA-CR-176905] N86-29958
Structural characterization and gas reactions of small metal particles by high-resolution TEM and TED
[NASA-CR-176949] N86-29959

PANEL METHOD (FLUID DYNAMICS)
Calculations of axisymmetric vortex sheet roll-up using a panel and a filament model
[NASA-CR-177081] N86-29767
Vortex sheet modeling with higher order curved panels
[NASA-CR-176971] N86-29770

PANELS
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] N86-29815

PANT PROGRAM
A comprehensive analysis algorithm for ablation, temperature fields and thermal stresses of the carbon-base nosetips
[AD-A166615] N86-29896

PARACHUTE DESCENT
Development drop test results of the 15-ft-dia ribbon parachute and 73-ft-dia cross parachute for the US Army Natick Laboratory UHLCADS System
[DE85-017614] N86-29785

PARACHUTE FABRICS
Development drop test results of the 15-ft-dia ribbon parachute and 73-ft-dia cross parachute for the US Army Natick Laboratory UHLCADS System
[DE85-017614] N86-29785

PARALLEL COMPUTERS
Organization of the channel-switching process in parallel computer systems based on a matrix optical switch
[NASA-TM-88452] N86-30406

PARALLEL PROCESSING (COMPUTERS)
Dynamic remapping of parallel computations with varying resource demands
[NASA-CR-178150] N86-30379
The force on the flex: Global parallelism and portability
[NASA-CR-178161] N86-30380
On substructuring algorithms and solution techniques for the numerical approximation of partial differential equations
[NASA-CR-178122] N86-30425

PARAMETER IDENTIFICATION
Connection of high-temperature strength and structural state of steel 12KhMF with parameters of signals of acoustic emission under tension
[BLL-M-36738-(5821.4)] N86-29953
Some new results concerning the dynamic behavior of annular turbulent seals N86-30174
Identification of bearing and seal dynamic stiffness parameters N86-30184
Input signal design for system identification; a comparative analysis
[ER-84/06] N86-30402
On compactness of admissible parameter sets: Convergence and stability in inverse problems for distributed parameter systems
[NASA-CR-178126] N86-30423
Estimation of discontinuous coefficients and boundary parameters for hyperbolic systems
[NASA-CR-178133] N86-30424
The estimation of minimal polynomial coefficients and a start sequence of Markov parameters
[ESA-86-97519] N86-30445
Identification of multivariable systems and representation in canonical and pseudo-canonical form
[ESA-86-97520] N86-30446
State estimation and parameter identification of linear and semilinear distributed parameter systems
[INPE-3v04-PRE/945] N86-30455
State estimation and parameter identification for semilinear distributed parameter systems
[INPE-3932-PRE/964] N86-30456

PARAMETERIZATION
State estimation for Cox processes with unknown law: Parametric models
[AD-A166179] N86-30432
Robust empirical bayes analyses of event rates
[AD-A166661] N86-30436
One-parameter families of optimization problems: Equality constraints
[ESA-86-97357] N86-30444
Critical sets in parametric optimization
[ESA-86-97358] N86-30466

PARSING ALGORITHMS
An algorithm to find minimal sequences of pass directions for attribute grammars --- programming languages
[INF-83-6] N86-30399

PARTIAL DIFFERENTIAL EQUATIONS
Flap-lag-torsional dynamics of helicopter rotor blades in forward flight
[NASA-CR-176976] N86-29810
Evidence of nonuniqueness and oscillatory solutions in computational fluid mechanics
[DE86-006493] N86-30111

PARTICLE ACCELERATION
The REBATRON as a high energy accelerator
[AD-A166624] N86-30487

PARTICLE COLLISIONS
Cross section calculations for subthreshold pion production in peripheral heavy-ion collisions
[NASA-TP-2600] N86-30485

PARTICLE DENSITY (CONCENTRATION)
Preliminary results of measurements by automated probes Vega 1 and 2 or particle concentration in clouds of Venus at heights 47-63 KM
[NASA-TM-88424] N86-30618

PARTICLE DIFFUSION
Rocket exhaust probe
[AD-D012224] N86-30132

PARTICLE SIZE DISTRIBUTION
Structural characterization and gas reactions of small metal particles by high-resolution, in-situ TEM and TED
[NASA-CR-176905] N86-29958
Scanning electron microscope study of nitroguanidine, M31A1 and m30 propellants
[AD-A166669] N86-30027
A procedure for evaluation of dust potential in desert terrains
[AD-A166491] N86-30245
A new instrument to measure charged and neutral cometary dust particles at low and high impact velocities
N86-30590

PARTICLE THEORY
Construction of higher order accurate vortex and particle methods
[NASA-CR-178132] N86-30096

PARTICLE TRAJECTORIES
AGgaussian wave packet method for studying time dependent quantum mechanics in a curve crossing system: Low energy motion, tunneling and thermal dissipation
[AD-A166262] N86-30558
Trajectory determinations and collection of micrometeoroids on the space station. Report of the Workshop on Micrometeorite Capture Experiments
[NASA-CR-177303] N86-30584

PARTICLES
Numerical and experimental studies of particle flow in a high-pressure boundary-layer wind tunnel
[NASA-CR-177008] N86-30092
Models and prediction of turbulent flow with suspended particles
[ONERA-RT-22/7135-EY] N86-30122
Models and prediction of turbulent flow with suspended particles. Report on the work done by Rouen University in 1984-85
[ONERA-RT-23/7135-EY] N86-30123

PARTICULATE SAMPLING
The use of tethered satellites for the collection of cosmic dust and the sampling of man made orbital debris far from the space station N86-30589

PARTICULATES
Scattering and absorption of light due to surface resonances on submicron oblate spheroidal particulates
[DE86-005261] N86-30500
An in-situ measurement of particulates from solid rocket motors fired in space N86-30585
Stratospheric dust collections: Valuable resources for space and atmospheric scientists N86-30586
Targeted flight opportunities with large area collectors
N86-30587

PASSENGER AIRCRAFT
Task Force report on emergency evacuation of transport airplanes, volume 1
[DOT/FAA/VS-86/1.1] N86-29793

PATIENTS
Selecting the best population, a decision theoretic approach: The case of Pareto distribution
[AD-A166152] N86-30449

PATTERN RECOGNITION
Report on the AI trip
[IR-82] N86-30397
Space infrared telescope pointing control system. Automated star pattern recognition
[NASA-CR-176911] N86-30606

PERCEPTION
Activities report in perception research
[IPO-19-1984] N86-30335

PERFORATING
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] N86-29815
Convective heat transfer from circular cylinders located within perforated cylindrical shrouds
[NASA-CR-4005] N86-30100

PERFORMANCE PREDICTION
Simplified examinations of the aerodynamic performances of tip vane rotors
[NLR-M-AT-84-007-L] N86-29787
Estimate of the aerodynamic performances of tip vane rotors using the Helix program
[NLR-TR-85027-L] N86-29788
Aerodynamic research on tip vane rotors, carried out by NLR, and a rough evaluation of the tip vane concept
[NLR-TR-85064-L] N86-29789

PERIODIC VARIATIONS
Nonlinear temporal modulation of pulsar radioemission
[DE86-700670] N86-30626

PERMEABILITY
Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025

PEROVSKITES
Investigation of oxide and fluoride hosts for blue-green lasers
[AD-A166620] N86-30142

PERSONNEL SELECTION
Canadian forces approach to aircrew medical selection N86-30311
Cardiovascular standards for selection and retention of high performance pilots in the USAF: Perspectives for the next decade N86-30313
Entry visual standards and ocular examination techniques for future fighter aircrew N86-30317
Sensitivity to color contrasts and the selection of navigator personnel N86-30318
Computer analysis of visual and vestibular oculomotor function in the medical selection of fighter aircrew members N86-30319

PERTURBATION
Perturbations of the Richardson number field by gravity waves
[NASA-CR-176910] N86-30273
Generalized banana-drift transport
[DE86-002535] N86-30509

PERTURBATION THEORY
Piecewise analytical perturbation series methods for solving linear ordinary differential equations. Part 2: The radial Schroedinger equations
[DE86-700606] N86-30438

PETROGRAPHY
Thin-sectioning and microanalysis of individual extraterrestrial particles N86-30586

PHASE CONTROL
A review of phase-only sidelobe nulling investigations at RADC (Rome Air Development Center)
[AD-A166602] N86-30045
Test configuration and procedure for determining the operational status of a phased array antenna
[AD-D012216] N86-30051

PHASE DIAGRAMS
Local density theory of heats of formation and short-range order parameters in substitutionally disordered alloys
[DE86-007979] N86-29982

PHASE LOCKED SYSTEMS
Pointing alignment by orthogonal phase-lock feedback loops
[DE86-006707] N86-30082

PHASE MATCHING
Frequency quadrupled Nd-Yag laser for LEGS
[DE86-008133] N86-30152
PHASE SHIFT CIRCUITS
Test configuration and procedure for determining the operational status of a phased array antenna
[AD-D012216] N86-30051
PHASE SHIFT KEYING
Modeling and equalization of nonlinear bandlimited satellite channels N86-30071
PHASE TRANSFORMATIONS
Nucleation of allotropic phases during pulsed laser annealing of manganese
[DE86-004584] N86-29973
Theory of amorphization kinetics in intermetallics
[DE86-004858] N86-29974
Phase transformations in nickel-aluminum alloys during ion beam mixing
[DE86-007519] N86-29980
Laser induced oxidation of heavily doped silicon
[DE86-006212] N86-30153
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A166273] N86-30526
Pseudopotentials and structure-property relationships in the solid state
[AD-A166385] N86-30530
High pressure electron resonance studies of electronic, magnetic and structural phase transitions
[DE85-016971] N86-30544
Topics in precipitation and ordering reactions and their related phenomena
[DE86-007483] N86-30549
Preliminary results of determination of chemical element concentrations in the aerosol of Venus clouds
[NASA-TM-86423] N86-30617
PHASED ARRAYS
Proceedings of the 1985 Antenna Applications Symposium, volume 1
[AD-A166754] N86-30048
Test configuration and procedure for determining the operational status of a phased array antenna
[AD-D012216] N86-30051
Dual scan rate radar
[AD-D012221] N86-30052
PHENYLS
Phenylquinoxaline resin monomers
[AD-D012236] N86-29996
PHOSPHATES
Preparation and optical properties of GA(x)IN(1-x)P alloys
[NASA-TM-88431] N86-30518
PHOSPHORS
Basic elements of nuclear geophysics
[DE86-700735] N86-30243
PHOTOCHEMICAL REACTIONS
Radiative augmented combustion
[AD-A166185] N86-29932
Proceedings of the Ninth DOE Solar Photochemistry Research Conference
[DE86-006167] N86-30252
Internal wave motion
[NASA-CR-178671] N86-30275
PHOTOCONDUCTIVITY
Light-induced excess conductivity and the role of argon in the deposition of doping-modulated amorphous silicon superlattices
[DE86-005812] N86-30535
Electrochemical photocapacitance spectroscopy of amorphous silicon alloy materials
[DE86-004421] N86-30546
PHOTODISSOCIATION
Radiative augmented combustion
[AD-A166185] N86-29932
Laser studies of halogens and oxygen
[AD-A166257] N86-30477
PHOTOELECTRIC EMISSION
Comparative studies of electron affinities and work functions for GaAs and Si
[AD-A166225] N86-30523
PHOTOGRAMMETRY
Potentials of large format camera photography
[AD-A166079] N86-30126
PHOTOGRAPHIC EQUIPMENT
A fast high power light pulse generator --- flash photography
[MPIS-18/1985] N86-30085
PHOTOINTERPRETATION
Visual aerial photograph texture discrimination for delineating homogeneous residential sectors: An instrument for urban planners
[INPE-3896-PRE/938] N86-30244
PHOTONS
Measurement of absolute emission cross sections for extreme ultraviolet (EUV) photons in thermal collisions of metastable helium (2 sup 1 S) with neon and helium
[MPIS-14/1985] N86-30480
PHOTOSYNTHESIS
Proceedings of the Ninth DOE Solar Photochemistry Research Conference
[DE86-006167] N86-30252
PHOTOVOLTAIC CONVERSION
Applications of laser annealing and laser-induced diffusion to photovoltaic conversion
[DE86-003809] N86-30254
PHOTOVOLTAIC EFFECT
Design considerations for stand-alone photovoltaic systems
[DE86-006470] N86-30253
PHYSICAL CHEMISTRY
Activities report of the Materials Science Center
[ESA-86-97388] N86-29903
Activities report of the Materials Science Center
[ESA-86-97389] N86-29904
PHYSICAL EXAMINATIONS
Canadian forces approach to aircrew medical selection N86-30311
Medical selection and physiological training of fighter pilots: A 1985 perspective and overview N86-30312
Cardiovascular standards for selection and retention of high performance pilots in the USAF: Perspectives for the next decade N86-30313
Selection and medical testing of Mirage 2000 pilots: Report of echocardiography N86-30314
Systematic radiographic examination of the spine for selection of F-16 pilots: A preliminary report N86-30323
Treadmill spiroergometry in the selection and screening of high-performance combat aircraft pilots in the Beligan Air Force N86-30325
PHYSICAL FITNESS
Medical Selection and Physiological Training of Future Fighter Aircrew
[AGARD-CP-396] N86-30309
Physical training of Mirage 2000 pilots N86-30324
Relationship of cardiopulmonary fitness to flight performance in tactical aviation N86-30326
PHYSIOLOGICAL EFFECTS
The temporal response of bone to unloading
[NASA-TM-89228] N86-30303
Aircrew aspects of United Stated future fighter aircraft N86-30310
A possible role for endogenous glucocorticoids in orchiectomy-induced atrophy of the rat levator ani muscle: Studies with RU38486, a potent and selective antiglucocorticoid
[NASA-CR-177029] N86-30343
PHYSIOLOGICAL RESPONSES
Thermoregulation after atropine and pralidoxime administration
[AD-A165868] N86-30304
Human vascular fluid responses to cold stress are not altered by cold acclimation
[AD-A165869] N86-30305
Hypobaric training of flight personnel without compromising quality of life N86-30327
PHYSIOLOGICAL TESTS
Canadian forces approach to aircrew medical selection N86-30311
PHYSIOLOGY
Specifications Physiological Monitoring System
[NASA-CR-171926] N86-30339
PIEZOELECTRIC CERAMICS
Cosmic dust detection with large surface piezoceramics N86-30604
PIEZOELECTRIC CRYSTALS
Detection of chemical vapor mixtures by sorption on multiple piezoelectric crystals
[DE86-006698] N86-29941
PIEZOELECTRIC TRANSDUCERS
Cosmic dust detection with large surface piezoceramics N86-30604
PIEZOELECTRICITY
Detection of chemical vapor mixtures by sorption on multiple piezoelectric crystals
[DE86-006698] N86-29941
PILOT ERROR
Investigation of hazards of helicopter operations and root causes of helicopter accidents
[FAA/PM-86/28] N86-29796
PILOT PERFORMANCE
Feasibility study for ergonomic analysis and design of future helicopter cockpit systems
[NASA-CR-176942] N86-29811
Improving the interpretability of an aircraft attitude indicator
[AD-A166329] N86-29817
Aircrew aspects of United Stated future fighter aircraft N86-30310
Vision test battery threshold and response time as predictors of air-to-air visual target acquisition in F-14 and adversary aircraft N86-30321
Relationship of cardiopulmonary fitness to flight performance in tactical aviation N86-30326
The importance of specialized cognitive function in the selection of military pilots
[AD-A165889] N86-30330
PILOT SELECTION
Medical Selection and Physiological Training of Future Fighter Aircrew
[AGARD-CP-396] N86-30309
Selection and medical testing of Mirage 2000 pilots: Report of echocardiography N86-30314
The vertebral column: Selection and aptitude of combat aircraft pilots of the future N86-30322
Systematic radiographic examination of the spine for selection of F-16 pilots: A preliminary report N86-30323
Treadmill spiroergometry in the selection and screening of high-performance combat aircraft pilots in the Beligan Air Force N86-30325
The importance of specialized cognitive function in the selection of military pilots
[AD-A165889] N86-30330
PILOT TRAINING
The importance of specialized cognitive function in the selection of military pilots
[AD-A165889] N86-30330
PILOTS (PERSONNEL)
Development of an algorithm to model an aircraft equipped with a generic CDTI display
[NASA-TM-87732] N86-30349
PINS
Computer simulation of rocket/missile safing and arming mechanism (containing pin pallet runaway escapement, three-pass involute gear train and acceleration driven rotor)
[AD-A166667] N86-29878
PIONS
Cross section calculations for subthreshold pion production in peripheral heavy ion collisions
[NASA-TP-2600] N86-30485
PIPE FLOW
Heat transfer, friction, and rheological characteristics of antimisting kerosene N86-30013
PIPELINES
Increase of life of threaded joints of tube couplings in oil pipeline range through use of anticorrosion coatings
[BLL-M-36718-(5828.4)] N86-29987
PIPELINING (COMPUTERS)
The force on the flex: Global parallelism and portability
[NASA-CR-178161] N86-30380
Introduction to the Fastbus
[DE86-005830] N86-30578
PIPES (TUBES)
Microstructure, microchemistry, and microdeformation of Alloy 600 tubing
[DE86-007947] N86-29983
Development of composite tube protective coatings
[NASA-CR-178116] N86-29989
Industrial inspection of grain size of precision tubes after heat treatment
[BLL-M-36744-(5828.4)] N86-30222
PISTON ENGINES
Steady and unsteady air flow through an intake valve of a reciprocating engine
[DE86-005208] N86-30209
PISTONS
The isentropic light piston annular cascade facility at RAE Pyestock N86-29851
Steady and unsteady air flow through an intake valve of a reciprocating engine
[DE86-005208] N86-30209
Syn-fuel reciprocating charge pump improvement program
[DE86-007482] N86-30216
PITOT TUBES
Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-176902] N86-29771
PLANE STRAIN
Computational significance of the intermediate configuration and hyperelastic stress relations in finite deformation elastoplasticity
[DE86-006720] N86-30239
PLANET EPHEMERIDES
Some navigation and almanac algorithms
[AD-A165840] N86-29803
PLANETARY ATMOSPHERES
Volatile components and continental material of planets
[NASA-TM-88478] N86-30615

PLANETARY COMPOSITION
Astrophysical materials science: Theory
[NASA-CR-177021] N86-30610
PLANETARY ENVIRONMENTS
Volatile components and continental material of planets
[NASA-TM-88478] N86-30615
PLANETARY EVOLUTION
Volatile components and continental material of planets
[NASA-TM-88478] N86-30615
PLANETARY GEOLOGY
Volatile components and continental material of planets
[NASA-TM-88478] N86-30615
PLANETOLOGY
Proceedings of the MECA Workshop on The Evoluation of the Martian Atmosphere
[NASA-CR-176899] N86-30614
PLANKTON
The stability of low-latitude sea-surface temperatures: An evaluation of the CLIMAP reconstruction with emphasis on the positive SST anomalies
[DE85-016190] N86-30300
PLASMA CYLINDERS
Radial distribution of excited atoms in a plasma column produced by a surface wave
[LP-214] N86-30513
PLASMA DENSITY
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895
Design and fabrication of an actively cooled Langmuir probe for long pulse applications
[DE86-005231] N86-30507
PLASMA DYNAMICS
Fundamental relativistic solution for the railgun
[AD-A166607] N86-30467
PLASMA FREQUENCIES
Shuttle contamination modeling: The plasma wave field of spacecraft
[AD-A166605] N86-29880
PLASMA HEATING
Thermal ion heating in the vicinity of the plasmapause: A Dynamics Explorer guest investigation
[NASA-CR-176993] N86-30272
PLASMA INTERACTIONS
Shuttle contamination modeling: The plasma wave field of spacecraft
[AD-A166605] N86-29880
PLASMA JETS
Plasma nitriding of metallic surfaces
[LP-211] N86-29984
PLASMA OSCILLATIONS
Enhanced small scale turbulence oscillations correlated to sawtooth relaxations in the TEXTOR tokamak
[JUEL-2025] N86-30515
PLASMA PHYSICS
Radial distribution of excited atoms in a plasma column produced by a surface wave
[LP-214] N86-30513
PLASMA SHEATHS
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895
PLASMA TEMPERATURE
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292
Cosmic X-ray physics
[NASA-CR-177227] N86-30624
PLASMA TURBULENCE
Enhanced small scale turbulence oscillations correlated to sawtooth relaxations in the TEXTOR tokamak
[JUEL-2025] N86-30515
PLASMA WAVES
Shuttle contamination modeling: The plasma wave field of spacecraft
[AD-A166605] N86-29880
Stimulated Raman scattering: Comparison of theory and experiment
[DE86-006480] N86-30501
PLASMAPAUSE
Thermal ion heating in the vicinity of the plasmapause: A Dynamics Explorer guest investigation
[NASA-CR-176993] N86-30272
PLASMONS
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166274] N86-30527
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166290] N86-30528
PLASTIC DEFORMATION
Residual stress and deformation energy under ground-surfaces of brittle solids --- glass grinding
[WB-85-16] N86-30241
PLASTIC MEMORY
Chemically cross-linked heat-shrinkable polyethylene tubes
[AD-A166745] N86-29997
PLASTICS
Phenylquinoxaline resin monomers
[AD-D012236] N86-29998
Hollow droplet generator for polymer shell production
[DE86-006482] N86-29999
PLATINUM ALLOYS
Topics in precipitation and ordering reactions and their related phenomena
[DE86-007483] N86-30549
PLUTONIUM
Space Nuclear Safety Program
[DE86-007197] N86-30492
PLUTONIUM COMPOUNDS
General-Purpose Heat Source safety verification test series: SVT-1 through SVT-6
[DE85-017956] N86-30489
PLY ORIENTATION
A modified microbonding test for direct in-situ fiber/matrix bond strength determination in fiber composites
[MIT-AR-R84-3] N86-29906
POINT DEFECTS
Theory of amorphization kinetics in intermetallics
[DE86-004858] N86-29974
Point defects and high-temperature deformation of NiO
[DE86-005560] N86-30534
POINTS (MATHEMATICS)
Construction of higher order accurate vortex and particle methods
[NASA-CR-178132] N86-30096
POISSON DENSITY FUNCTIONS
State estimation for Cox processes with unknown law: Parametric models
[AD-A166179] N86-30432
POLARIZATION (SPIN ALIGNMENT)
Orientation effects and fine structure transitions in differential scattering cross sections
[MPIS-15/1985] N86-30481
POLARIZED LIGHT
Scattering and absorption of light due to surface resonances on submicron oblate spheroidal particulates
[DE86-005261] N86-30500
POLICIES
Introduction to the recent developments of China's civil aviation
[AD-A166194] N86-29763
Worldwide report: Telecommunications policy, research, and development
[JPRS-TTP-86-013] N86-29697
Worldwide report: Telecommunications policy, research and development
[JPRS-TTP-86-011] N86-30064
POLLUTION
Comparison of extraction techniques and solvents for explosive residues in soil
[AD-A166474] N86-30026
POLLUTION CONTROL
Database assessment of pollution control in the military explosives and propellants production industry
[AD-A165853] N86-30264
POLLUTION MONITORING
Data collection and analysis for HCl, SO2, and NO2 immission-emission differential absorption lidars
[GKSS-85/E/53] N86-30268
Remote measurement of tropospheric parameters by lidar --- pollution monitoring
[GKSS-85/E/50] N86-30283
POLYATOMIC MOLECULES
Local density theory of heats of formation and short-range order parameters in substitutionally disordered alloys
[DE86-007979] N86-29982
POLYCRYSTALS
Investigation of oxide and fluoride hosts for blue-green lasers
[AD-A166620] N86-30142
Computer simulation of microstructural dynamics
[DE86-006045] N86-30541
POLYETHYLENES
The influence of chemical structure on the strength of rubber
[AD-A166355] N86-29993
Small angle neutron scattering study on a polymer blend: Characterization of the deformation behavior
[DE86-006099] N86-30003
POLYGONS
A collection of Area of Interest (AOI) algorithms
[NASA-CR-176984] N86-30404
POLYHEDRONS
Graph theory in the study of metal cluster bonding topology: Applications to metal clusters having fused polyhedra
[AD-A166623] N86-29937
POLYIMIDES
Feasibility study of a discrete bearing/roller drive rotary joint for the space station
[NASA-TM-88800] N86-30206
POLYMER CHEMISTRY
Activities report of the Materials Science Center
[ESA-86-97388] N86-29903
Activities report of the Materials Science Center
[ESA-86-97389] N86-29904
Phenylquinoxaline resin compositions
[AD-D012230] N86-29912
Properties of spring steels hardened in polymer-bearing medium
[BLL-M-36734-(5828.4)] N86-29952
Small angle neutron scattering study on a polymer blend: Characterization of the deformation behavior
[DE86-006099] N86-30003
POLYMER MATRIX COMPOSITES
Experiments and micromechanical models for creep-rupture in polymer matrix composites
[DE86-007980] N86-29916
POLYMERIC FILMS
Elasticity, tear strength and strength of adhesion of soft PVC gels
[AD-A166356] N86-29994
POLYMERIZATION
Carbon-rich ceramic composites from ethynyl aromatic precrusors
[NASA-TM-88812] N86-29908
General investigations of composite materials. Adhesive bonding of carbon composites --- carbon fibers
[SNIAS-2647/DCI-PR/85] N86-29919
Hollow droplet generator for polymer shell production
[DE86-006482] N86-29999
Small angle neutron scattering study on a polymer blend: Characterization of the deformation behavior
[DE86-006099] N86-30003
Evidence of nonuniqueness and oscillatory solutions in computational fluid mechanics
[DE86-006493] N86-30111
POLYNOMIALS
Generating ideals in polynomial rings N86-30419
The estimation of minimal polynomial coefficients and a start sequence of Markov parameters
[ESA-86-97519] N86-30445
Tail behavior for the suprema of Gaussian processes with a view towards empirical processes
[AD-A166151] N86-30461
POLYPHENYLS
Graph theory in the study of metal cluster bonding topology: Applications to metal clusters having fused polyhedra
[AD-A166623] N86-29937
POLYQUINOXALINES
Phenylquinoxaline resin compositions
[AD-D012230] N86-29912
Phenylquinoxaline resin monomers
[AD-D012236] N86-29998
POLYSTYRENE
Interfacial tension of demixed polymer solutions
[DE86-003035] N86-30000
POLYURETHANE RESINS
Study of test methods for urethane elastomers
[AD-A166293] N86-29992
POLYVINYL CHLORIDE
Elasticity, tear strength and strength of adhesion of soft PVC gels
[AD-A166356] N86-29994
POPULATION INVERSION
Measurement of population inversions and gain in carbon fiber plasmas
[DE86-002532] N86-30508
POPULATION THEORY
Robust empirical bayes analyses of event rates
[AD-A166681] N86-30436
Selecting the best population, a decision theoretic approach: The case of Pareto distribution
[AD-A166152] N86-30449
PORPHYRINS
Proceedings of the Ninth DOE Solar Photochemistry Research Conference
[DE86-006167] N86-30252
PORTABLE EQUIPMENT
Study of test methods for urethane elastomers
[AD-A166293] N86-29992
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129
Specifications Physiological Monitoring System
[NASA-CR-171926] N86-30339

POSITION (LOCATION)
A description of prediction errors associated with the T-Bus-4 navigation message and a corrective procedure
[NOAA-TM-NESDIS-16] N86-29875
Spatiotemporal characteristics of visual localization
[AD-A166097] N86-30331
Auditory helicopter detection and localization; a literature review focusing on search for helicopters
[FOA-C-50033-H2] N86-30474
POSITIONING
Random beam positioning surveillance process
[AD-D012251] N86-30053
POTENTIAL ENERGY
Molecular dynamics of reactions forming electronically excited products
[AD-A166168] N86-29931
POTENTIAL THEORY
Pseudopotentials and structure-property relationships in the solid state
[AD-A166385] N86-30530
POWDER METALLURGY
Powder metallurgy: Achievements, details and plans
[BLL-M-36780-(5828.4)] N86-29956
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A166466] N86-29968
POWER CONDITIONING
Charge accumulation and arc discharges on spacecraft materials and components
[AD-A166216] N86-29893
POWER SPECTRA
Multichannel relative-entropy spectrum analysis
[AD-A166625] N86-30046
PRECIPITATION (CHEMISTRY)
Topics in precipitation and ordering reactions and their related phenomena
[DE86-007483] N86-30549
PRECIPITATION (METEOROLOGY)
Anomalous US weather patterns accompanying stratospheric sudden warming
[AD-A166371] N86-30290
PRECISION
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129
Industrial inspection of grain size of precision tubes after heat treatment
[BLL-M-36744-(5828.4)] N86-30222
PRECONDITIONING
Preconditioning for first-order spectral discretization
[NASA-TM-87619] N86-30427
PREDICTION ANALYSIS TECHNIQUES
Experimental and theoretical study of propeller spinner/shank interference
[NASA-CR-176954] N86-29773
Component base flow analysis
[AD-A166283] N86-29781
A description of prediction errors associated with the T-Bus-4 navigation message and a corrective procedure
[NOAA-TM-NESDIS-16] N86-29875
Investigations of creep cavitation in type 304 stainless steel
[DE86-007187] N86-29978
Microstructure effects on ion and electron transport parameters during passive corrosion of zircaloy
[DE86-007189] N86-29979
Evidence of nonuniqueness and oscillatory solutions in computational fluid mechanics
[DE86-006493] N86-30111
Analytical prediction of labyrinth-seal-flow-induced arotor excitation forces N86-30175
A viscoelastic-damage simulation model for filament-wound pressure vessels
[AD-A166389] N86-30208
PREDICTIONS
Models and prediction of turbulent flow with suspended particles. Report on the work done by Rouen University in 1984-85
[ONERA-RT-23/7135-EY] N86-30123
Evaluation of the numerical stability and sensitivity of material parameter variations for several unified constitutive models
[MM-4998-85-6-PT-1] N86-30230
The physical and empirical basis for a specific clear-air turbulence risk index
[NASA-CR-3971] N86-30285
The use of ECG changes caused by acceleration as tolerance predicition factors N86-30316
Sonic-boom research: Selected bibliography with annotation
[NASA-TM-87685] N86-30470
PREMIXED FLAMES
Measurements of fluctuating gas temperatures using compensated fine wire thermocouples N86-29852
PRESERVING
Quality assurance for water sampling
[AD-A165842] N86-30263
PRESSURE BREATHING
Assisted positive pressure breathing and modified anti-acceleration suit filling tested up to 9 G in a human centrifuge, Karolinska Institute
[FOA-C-50038-H1] N86-30341
PRESSURE CHAMBERS
An environmentally-controlled extended-use small animal hypobaric chamber
[AD-A166729] N86-30307
PRESSURE DISTRIBUTION
Analytical prediction of labyrinth-seal-flow-induced arotor excitation forces N86-30175
PRESSURE EFFECTS
Relation between microstructural heterogeneous surface layer and nitrogen pressure during sintering in Si3N4-MI2O3 ceramics
[NASA-TM-88409] N86-29988
PRESSURE GRADIENTS
Effects of hole geometry, wall curvature and pressure gradient on film cooling downstream of a single row --- gas turbine cooling N86-29831
Hydrogen-combustion analyses of large-scale tests
[DE86-004722] N86-29944
PRESSURE ICE
Mechanical properties of multi-year sea ice. Phase 2: Test results
[AD-A166333] N86-30299
PRESSURE MEASUREMENT
Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-176902] N86-29771
Optical diagnostics of gas-dynamic flows using advanced laser measurement techniques
[NASA-CR-176950] N86-30095
Preliminary instrumentation for aeroelastic tests at the compressor level --- turbocompressor test bench
[ONERA-RT-95/7108-RY-054-R] N86-30219
PRESSURE REDUCTION
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins N86-29827
Pressure drop in flashing flow through obstructions
[DE86-007152] N86-30113
Oil seal effects and subsynchronous vibrations in high-speed compressors N86-30176
PRESSURE SENSORS
Effect of Reynolds Number and Mach Number on flow angularity probe sensitivity
[NASA-TM-87750] N86-29774
Computations and turbulent flow modeling in support of helicopter rotor technology
[NASA-CR-177095] N86-30090
PRESSURE SUITS
Assisted positive pressure breathing and modified anti-acceleration suit filling tested up to 9 G in a human centrifuge, Karolinska Institute
[FOA-C-50038-H1] N86-30341
PRESSURE VESSELS
A viscoelastic-damage simulation model for filament-wound pressure vessels
[AD-A166389] N86-30208
Investigation of the extent and nature of the cracks found in segments of two Cr - 0.5 Mo pressure vessels from the NIL residual creep life program
[MR/814/85] N86-30242
PRINTED CIRCUITS
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129
Application of artificial intelligence techniques to fault diagnosis for printed circuits
[ENST-85E011] N86-30413
PRIVACY
Implications of privacy needs and interpersonal distancing mechanisms for space station design
[NASA-CR-176938] N86-30338
PROBABILITY DENSITY FUNCTIONS
Application of rayleigh scattering to turbulent flow with heat transfer and combustion
[AD-A166223] N86-29933
PROBABILITY DISTRIBUTION FUNCTIONS
Walsh-Fourier analysis of discrete-valued time series
[AD-A166139] N86-30430
Mathematical and statistical characterizations of generalized hyperexponential distribution functions
[AD-A165892] N86-30448
The number of classes in chi-square goodness of fit tests
[IR-246] N86-30451
PROBABILITY THEORY
State estimation for Cox processes with unknown law: Parametric models
[AD-A166179] N86-30432
PROBLEM SOLVING
MECHAN: Dynamic analysis of planar mechanisms
[DE85-018023] N86-30214
Shared memory, cache, and frontwidth considerations in multifrontal algorithm development
[DE86-007245] N86-30393
Piecewise analytical perturbation series methods for solving linear ordinary differential equations. Part 2: The radial Schroedinger equations
[DE86-700606] N86-30438
PROCESS CONTROL (INDUSTRY)
Performance of commercial and research grade SiC whiskers in a borosilicate glass matrix
[DE86-007379] N86-29914
PRODUCTIVITY
Experiments with Ada N86-30367
PROGENY
Biological studies of swine exposed to 60-Hz electric fields. Volume 5: Hematology and serum chemistry
[DE86-005362] N86-30344
PROGRAM VERIFICATION (COMPUTERS)
Ada (trade name) compiler validation summary report: SofTech, Inc. AdaVAX compiler version 2.47, VAX8600, VAX-11/780, VAX-11/785; and MicroVAX 2 us ing VAX/VMS version 4.1 and MicroVMS 4.1M
[AD-A166213] N86-30350
Ada (trade name) compiler validation summary report: Digital Equipment Corporation VAX Ada compiler version 1.1 VAX 8600, VAX-11/785, VAX-11/780, VAX-11/782, VAX-11/750, VAX-11/730, MicroVAX 1 and 2 VAXstation 1 and 2 using VAX/VMS and MicroVMS version 4.2 and VAXELN version 2
[AD-A166354] N86-30351
An experimental evaluation of error seeding as a program validation technique N86-30362
The status of verification technology for the Ada (Trademark) language
[AD-A166664] N86-30384
PROGRAMMING LANGUAGES
An algorithm to find minimal sequences of pass directions for attribute grammars --- programming languages
[INF-83-6] N86-30399
A formal description technique and the ISO transport layer --- Open Systems Interconnection
[INF83/IPS/007] N86-30410
Application of artificial intelligence techniques to fault diagnosis for printed circuits
[ENST-85E011] N86-30413
PROGRESS
X-ray satellite (Rosat)
[NASA-TM-88481] N86-29889
PROJECT MANAGEMENT
Measuring the software process and product: Lessons learned in the SEL N86-30358
Software management tools: Lessons learned from use N86-30360
DEASEL: An expert system for software engineering N86-30361
Experience with a software engineering environment framework N86-30365
United States Air Force Summer Faculty Research Program management report, 1985
[AD-A166175] N86-30561
United States Air Force Summer Faculty Research Program, 1985 technical report, volume 1
[AD-A166176] N86-30562
United States Air Force Summer Faculty Research Program, 1985 technical report, volume 2
[AD-A166177] N86-30563
United States Air Force Summer Faculty Research Program 1985 technical report, volume 3
[AD-A166178] N86-30564
Small Business Innovation Research. Abstracts of Phase 2 awards, 1985
[DE86-005392] N86-30567
PROJECT PLANNING
Energy Sciences Advanced Computation program plan
[DE86-006958] N86-30391
PROJECTILES
Fundamental relativistic solution for the railgun
[AD-A166607] N86-30467
PROPELLANTS
Fireworks in space
[AD-A166268] N86-29902
Scanning electron microscope study of nitroguanidine, M31A1 and m30 propellants
[AD-A166669] N86-30027
PROPELLER EFFICIENCY
Investigation of the aerodynamic performance and noise characteristics of a 1/5th scale model of the Dowty Rotol R212 propeller
[RAE-TM-AERO-1983] N86-30468

PROPELLERS
Experimental and theoretical study of propeller spinner/shank interference
[NASA-CR-176954] N86-29773
PROTECTION
The electrification of spacecraft
[NASA-TM-77653] N86-29885
PROTECTIVE COATINGS
Increase of life of threaded joints of tube couplings in oil pipeline range through use of anticorrosion coatings
[BLL-M-36718-(5828.4)] N86-29987
Development of composite tube protective coatings
[NASA-CR-178116] N86-29989
UV cured epoxide coating
[DE86-003728] N86-30001
Feasibility study of a discrete bearing/roller drive rotary joint for the space station
[NASA-TM-88600] N86-30206
PROTOCOL (COMPUTERS)
Japan report: Science and technology
[JPRS-JST-86-011] N86-30086
Issues in LSI automation, protocol standardization
N86-30087
PROTOTYPES
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] N86-29764
The DoD gateway information system: Prototype experience
[AD-A166200] N86-30570
PSEUDOPOTENTIALS
Pseudopotentials and structure-property relationships in the solid state
[AD-A166385] N86-30530
PSYCHOLOGICAL EFFECTS
Aircrew aspects of United Stated future fighter aircraft
N86-30310
PSYCHOLOGICAL TESTS
Canadian forces approach to aircrew medical selection N86-30311
Attention tasks and their relation to aging and flight experience
[IZF-1986-4] N86-30337
PSYCHOPHYSICS
Spatiotemporal characteristics of visual localization
[AD-A166097] N86-30331
Novel architectures for image processing based on computer simulation and psychophysical studies of human visual cortex
[AD-A166222] N86-30333
PULMONARY FUNCTIONS
Treadmill spiroergometry in the selection and screening of high-performance combat aircraft pilots in the Beligan Air Force N86-30325
Relationship of cardiopulmonary fitness to flight performance in tactical aviation N86-30326
PULSARS
Nonlinear temporal modulation of pulsar radioemission
[DE86-700670] N86-30626
PULSE AMPLITUDE MODULATION
Dual scan rate radar
[AD-D012221] N86-30052
PULSE COMMUNICATION
A survey of the state of the art and focused research in range systems, task 2
[NASA-CR-176988] N86-30069
Modeling and equalization of nonlinear bandlimited satellite channels N86-30071
Pulse repetition modulator apparatus
[AD-D012237] N86-30079
PULSE DURATION
Design and fabrication of an actively cooled Langmuir probe for long pulse applications
[DE86-005231] N86-30507
PULSE GENERATORS
A fast high power light pulse generator — flash photography
[MPIS-18/1985] N86-30085
PULSE RADAR
Dual scan rate radar
[AD-D012221] N86-30052
PULSE REPETITION RATE
Pulse repetition modulator apparatus
[AD-D012237] N86-30079
PULSE TIME MODULATION
Pulse repetition modulator apparatus
[AD-D012237] N86-30079
PULSED LASERS
Solidification dynamics and microstructure of metals in pulsed laser irradiation
[DE86-002169] N86-29972
Pulsed chemical laser technology development test plan single pulse diagnostic testing
[AD-A166203] N86-30140
A high repetition rate and mode-locked phosphate glass laser
[AD-A166303] N86-30141
PULSES
Modeling of chemical kinetics in pulse combustors
[DE86-001571] N86-29938
ECUT pulse combustion research program: A milestone report
[DE86-007747] N86-29946
PUMP SEALS
Syn-fuel reciprocating charge pump improvement program
[DE86-007482] N86-30216
PUMPS
Hydraulic induced instability on a vertical service
N86-30189
Syn-fuel reciprocating charge pump improvement program
[DE86-007482] N86-30216
PURITY
Mechanism of stress-corrosion cracking of Alloy X-750 in high purity water
[DE86-006361] N86-29969
PYLONS
Flight test of a decoupler pylon for wing/store flutter suppression
[NASA-TM-87767] N86-29814
PYROLYSIS
Chemistry of new silicon containing polymers triply bonded silicon intermediates
[AD-A166085] N86-29990
PYROTECHNICS
Fireworks in space
[AD-A166268] N86-29902
PYRROLES
Elementary reactions of electronically excited molecules 6. Quenching of O2(1 delta g) by amines, furanes, pyrroles, and thiophenes
[MPIS-21/1985] N86-30484

Q

QUALITY CONTROL
Some tentative ideas on developing our low-alloy and alloy steel
[AD-A166269] N86-29964
UK work on safety fuels N86-30012
Quality assurance software inspections at NASA Ames: Metrics for feedback and modification N86-30363
QUANTUM CHEMISTRY
Theoretical research program to study chemical reactions in AOTV bow shock tubes
[NASA-CR-176992] N86-30373
Integral processing in beyond-Hartree-Fock calculations N86-30374
Benchmark full configuration-interaction calculations on H2O, F- and F N86-30375
Benchmark full configuration-interaction calculations on HF and NH2 N86-30376
On the electron affinity of the oxygen atom
N86-30377
QUANTUM MECHANICS
An efficient method for solving quantum Liouville equation: Applications to electronic absorption spectroscopy
[AD-A166260] N86-29935
AGgaussian wave packet method for studying time dependent quantum mechanics in a curvé crossing system: Low energy motion, tunneling and thermal dissipation
[AD-A166262] N86-30558
QUANTUM THEORY
Pseudopotentials and structure-property relationships in the solid state
[AD-A166385] N86-30530
QUARTZ TRANSDUCERS
A study of group-type single-phase unidirectional SAW transducers on LiNbO3 and quartz — bandpass filters
[AD-A165670] N86-30067
QUENCHING (ATOMIC PHYSICS)
Elementary reactions of electronically excited molecules 6. Quenching of O2(1 delta g) by amines, furanes, pyrroles, and thiophenes
[MPIS-21/1985] N86-30484
QUENCHING (COOLING)
Use of acoustic emission in study of defects in butt weld during cooling
[BLL-M-36732-(5828.4)] N86-30221
QUEUEING THEORY
On inference and transient response for M/G/1 models
[AD-A166578] N86-30458
A note on the evaluation of the mean value scheme for closed multichain queueing networks
[MEMO-COSOR-84-04] N86-30460

R

RADAR
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] N86-29806
Subsystem hazard analysis for the LSI models 6216A, B and C self-contained navigation sysgem group A
[AD-A166816] N86-29807
RADAR CROSS SECTIONS
The ESA C-band wind scatterometer campaign: Preliminary campaign definition
[ESA-86-97552] N86-30060
RADAR DETECTION
Radar detection ranges, taking into account wave propagation phenomena
[REPT-13-85] N86-30034
RADAR IMAGERY
Implementation of map-to-image-correspondence for synthetic aperture radar image analysis
[AD-A166791] N86-30246
Microwave remote sensing and vegetation: Problems, progress and solutions, a review
[ESA-86-97556] N86-30250
RADAR MEASUREMENT
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292
Sensitivity of refractive index profile models to relative humidity sensor errors
[AD-A166626] N86-30293
Orbital debris measurements N86-30593
RADAR RANGE
Radar detection ranges, taking into account wave propagation phenomena
[REPT-13-85] N86-30034
RADAR SCANNING
Dual scan rate radar
[AD-D012221] N86-30052
RADAR TRANSMISSION
Data transmission by radar — jamming resistance
[REPT-8-85] N86-30032
RADIAL DISTRIBUTION
Radial distribution of excited atoms in a plasma column produced by a surface wave
[LP-214] N86-30513
RADIATION DAMAGE
Structural characterization and gas reactions of small metal particles by high-resolution TEM and TED
[NASA-CR-176949] N86-29959
RADIATION DETECTORS
Basic elements of nuclear geophysics
[DE86-700735] N86-30243
RADIATION DOSAGE
Bacterial inactivation by means of ionizing radiation
[DE86-901038] N86-30348
RADIATION EFFECTS
Cryogenic explosion environment modeling and testing of space shuttle and light-weight radioisotope heater unit interactions
[DE86-005901] N86-29881
Theory of amorphization kinetics in intermetallics
[DE86-004858] N86-29974
In situ high voltage electron microscope studies of ion- and electron-beam induced modification of materials
[DE86-005577] N86-30491
RADIATION PROTECTION
Space Nuclear Safety Program
[DE86-007197] N86-30492
Space Nuclear Safety Program
[DE86-007206] N86-30493
Technical issues and requirements of experiments and facilities for fusion nuclear technology, FINESSE phase 1, volume 2
[DE86-006503] N86-30511
RADIATION SPECTRA
Theoretical study of the radiative and kinetic properties of selected metal oxides and air molecules
[AD-A166113] N86-30521
RADIATIVE HEAT TRANSFER
Computation of thermal radiation for gas turbine conditions N86-29841
Role of fuel chemical properties on combustor radiative heat load
[NASA-CR-177096] N86-30023
RADIATIVE TRANSFER
Atmospheric, climatic and environmental research
[NASA-CR-176880] N86-30287
RADICALS
Benchmark full configuration-interaction calculations on HF and NH2 N86-30376

RADIO ASTRONOMY
Analysis of Jovian decamteric data: Study of radio emission mechanisms
[NASA-CR-176878] N86-30619
RADIO BURSTS
Analysis of Jovian decamteric data: Study of radio emission mechanisms
[NASA-CR-176878] N86-30619
RADIO CONTROL
Test configuration and procedure for determining the operational status of a phased array antenna
[AD-D012216] N86-30051
RADIO EMISSION
Analysis of Jovian decamteric data: Study of radio emission mechanisms
[NASA-CR-176878] N86-30619
Nonlinear temporal modulation of pulsar radioemission
[DE86-700670] N86-30626
RADIO FREQUENCIES
Wide-band distributed RF coupler
[AD-D012214] N86-30049
Crystalline surfactant dispersions by radio frequency absorption
[DE86-000267] N86-30551
RADIO TRANSMISSION
A satellite broadcast receiving terminal
[ESA-86-97317] N86-30057
RADIO WAVES
Research and development activities of the Indian Institute of Geomagnetism N86-30274
RADIOACTIVE ISOTOPES
Cryogenic explosion environment modeling and testing of space shuttle and light-weight radioisotope heater unit interactions
[DE86-005901] N86-29881
Preliminary results of determination of chemical element concentrations in the aerosol of Venus clouds
[NASA-TM-88423] N86-30617
RADIOACTIVE WASTES
Review of fracture properties of nuclear materials determined by Hertzian indentation
[DE86-005520] N86-30238
RADIOGRAPHY
Systematic radiographic examination of the spine for selection of F-16 pilots: A preliminary report
N86-30323
RADIOMETRIC CORRECTION
Internal Side-looking Airborne Radar (SLAR) calibration
[85.68220.002] N86-30062
RADIOSONDES
Imaging and sounding instruments in the spin stabilized version of the second generation Meteosat
[REPT-80/1568] N86-29899
Sensitivity of refractive index profile models to relative humidity sensor errors
[AD-A166626] N86-30293
RAILGUN ACCELERATORS
Fundamental relativistic solution for the railgun
[AD-A166607] N86-30467
RAMAN SPECTRA
Cluster-model calculation of raman intensity for vibration of CO adsorbed on copper
[AD-A166239] N86-29934
RAMAN SPECTROSCOPY
Cluster-model calculation of raman intensity for vibration of CO adsorbed on copper
[AD-A166239] N86-29934
Stimulated Raman scattering: Comparison of theory and experiment
[DE86-006480] N86-30501
RANDOM PROCESSES
Random beam positioning surveillance process
[AD-D012251] N86-30053
State estimation for Cox processes with unknown law: Parametric models
[AD-A166179] N86-30432
RANDOM VARIABLES
A simple example where the jacknife fails — maximum likelihood estimates
[IR-256] N86-30452
RARE EARTH COMPOUNDS
Investigation of oxide and fluoride hosts for blue-green lasers
[AD-A166620] N86-30142
RARE GASES
Radial distribution of excited atoms in a plasma column produced by a surface wave
[LP-214] N86-30513
RATS
The temporal response of bone to unloading
[NASA-TM-89228] N86-30303
Multiparameter data acquisition systems for studies of Circadian rhythms
[DE86-004041] N86-30308
RAYLEIGH SCATTERING
Application of rayleigh scattering to turbulent flow with heat transfer and combustion
[AD-A166223] N86-29933
RDX
Comparison of extraction techniques and solvents for explosive residues in soil
[AD-A166474] N86-30026
REACTION KINETICS
Improving the interpretability of an aircraft attitude indicator
[AD-A166329] N86-29817
Heat transfer in gas turbine combustors: A discussion of mathematical modeling of combustion, heat and mass transfer with emphasis on heat transfer in gas turbine combustors N86-29843
Molecular dynamics of reactions forming electronically excited products
[AD-A166168] N86-29931
Radiative augmented combustion
[AD-A166185] N86-29932
Modeling of chemical kinetics in pulse combustors
[DE86-001571] N86-29938
ECUT pulse combustion research program: A milestone report
[DE86-007747] N86-29946
Failure analysis and microcrack dependent discontinuum mechanics
[DE86-006710] N86-30240
Laser studies of halogens and oxygen
[AD-A166257] N86-30477
Elementary reactions of electronically excited molecules 6. Quenching of O2(1 delta g) by amines, furanes, pyrroles, and thiophenes
[MPIS-21/1985] N86-30484
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A166273] N86-30526
Effects of the low Earth orbital environment on spacecraft materials N86-30595
REACTION TIME
Vision test battery threshold and response time as predictors of air-to-air visual target acquisition in F-14 and adversary aircraft N86-30321
REACTOR MATERIALS
Cutting of metal components by intergranular cracking
[DE86-006949] N86-30213
REACTOR SAFETY
Hydrogen-combustion analyses of large-scale tests
[DE86-004722] N86-29944
REAL TIME OPERATION
Investigation of basic characteristics of laser heating in thermoluminescence and of laser-stimulated luminescence
[AD-A166069] N86-30138
Laser ignition studies
[DE86-006043] N86-30151
Submerged arc welding control via arc sensing
[AD-A166320] N86-30207
RECOMBINATION COEFFICIENT
Electron-ion recombination in air at EMP fields
[AD-A166211] N86-30486
RECOMBINATION REACTIONS
Theory and analysis of soft X-ray laser experiments
[DE86-005177] N86-30148
One-component plasma model and large Z laboratory plasmas
[AD-A166606] N86-30506
A study of (OI) 63.2 and 145.5 micron emission from M17 and SGR A from the Lear jet
[NASA-CR-177015] N86-30525
RECRYSTALLIZATION
Structural characterization and gas reactions of small metal particles by high-resolution TEM and TED
[NASA-CR-176949] N86-29959
Microstructural dynamics of primary and secondary recrystallization
[DE86-006046] N86-30536
RECURSIVE FUNCTIONS
Preliminary investigation of a calculus of functional differences: Fixed differences
[AD-A165879] N86-30429
REDUCED GRAVITY
Effects of simulated weightlessness on meiosis. Fertilization, and early development in mice
[NASA-CR-177106] N86-30342
REENTRY COMMUNICATION
Experimental study of chemical alleviation for improving reentry communication
[AD-A165862] N86-30042
REENTRY VEHICLES
A comprehensive analysis algorithm for ablation, temperature fields and thermal stresses of the carbon-base nosetips
[AD-A166615] N86-29896
REFRACTIVITY
Chalcogenide glasses. Part 2: Optical thickness temperature relation in chalcogenide glass films
[AD-A166589] N86-29995
Sensitivity of refractive index profile models to relative humidity sensor errors
[AD-A166626] N86-30293
Acta Optica Sinica (selected articles)
[AD-A166281] N86-30495
Semiconducting transition metal silicides for electro-optic VSLI interconnects
[AD-A165895] N86-30519
REFRACTORY MATERIALS
Simultaneous combustion synthesis and densification of refractory materials
[DE86-006526] N86-29939
Creep and fracture characteristics of materials and structures at elevated temperatures
[AD-A166575] N86-30237
Study of surfaces and surface layers on high temperature materials after short-time thermal loads — tokamaks
[JUEL-2024] N86-30514
Development of accurate estimation methods for calculating heat capacities of refractory materials
[DE86-004242] N86-30559
REFRACTORY METALS
Space Nuclear Safety Program
[DE86-007197] N86-30492
REFRIGERANTS
New and future heat pump technologies
[DE86-007866] N86-30117
REFRIGERATING
Dynamics insulation systems
[NASA-CR-177026] N86-30554
REFRIGERATING MACHINERY
Background review on compressors for gas engine-driven heat pumps
[PB86-201175] N86-30220
REGENERATION (ENGINEERING)
Heat exchangers in regenerative gas turbine cycles
N86-29857
REGRESSION ANALYSIS
Effects of 60 Hz electric field on operant and social stress behaviors of nonhuman primates
[DE85-016121] N86-30346
Exponential bounds of mean error for the nearest neighbor estimates of regression functions
[AD-A166156] N86-30450
REGULATORS
A self-tuning regulator based on pole placement design for use in satellite attitude control
[INPE-3861-PRE/924] N86-29887
REINFORCEMENT (STRUCTURES)
Effects of thermal and cyclic loads on silicon carbide yarn reinforced glass matrix composites
[DE86-006793] N86-29913
REINFORCING FIBERS
Study of test methods for urethane elastomers
[AD-A166293] N86-29992
RELATIVISTIC VELOCITY
Considerations about the apparent superluminal expansions in astrophysics
[DE86-701328] N86-30613
RELATIVITY
Fundamental relativistic solution for the railgun
[AD-A166607] N86-30467
Lorentz invariance and the rotor Doppler shift experiments
[DE86-700614] N86-30473
On experiments to detect possible failures of relativity theory
[DE86-700613] N86-30560
RELAXATION (MECHANICS)
Enhanced small scale turbulence oscillations correlated to sawtooth relaxations in the TEXTOR tokamak
[JUEL-2025] N86-30515
RELIABILITY ANALYSIS
Application of systems analysis techniques to vulnerability studies of complex installations
[DE86-006012] N86-30223
ASSIST: User's manual
[NASA-TM-87735] N86-30447
REMOTE HANDLING
Cutting of metal components by intergranular cracking
[DE86-006949] N86-30213
REMOTE MANIPULATOR SYSTEM
Proceedings of the 2nd Annual Conference on NASA/University Advanced Space Design Program
[NASA-TM-89399] N86-29888
REMOTE SENSING
VARAN-S: An airborne synthetic aperture radar for research in microwave remote sensing
[CNES-CT/DRT/TIT/RL-93-T] N86-30036
Internal Side-looking Airborne Radar (SLAR) calibration
[85.68220.002] N86-30062

RESIDENTIAL AREAS
Visual aerial photograph texture discrimination for delineating homogeneous residential sectors: An instrument for urban planners
[INPE-3896-PRE/938] N86-30244

RESIDUAL STRESS
Residual stress and deformation energy under ground-surfaces of brittle solids — glass grinding
[WB-85-16] N86-30241

RESIDUES
Comparison of extraction techniques and solvents for explosive residues in soil
[AD-A166474] N86-30026

RESISTANCE THERMOMETERS
High frequency response heat flux gauge for metal blading N86-29850

RESONANCE FLUORESCENCE
Laser induced fluorescence of FCO radicals in the gas phase
[MPIS-17/1985] N86-29950
Near resonant absorption by atoms in intense fluctuating laser fields
[DE86-006513] N86-30159

RESONANT VIBRATION
Rotor-to-stator rub vibration in centrifugal compressor N86-30178
Cracked shaft detection on large vertical nuclear reactor coolant pump N86-30180
Vertical reactor coolant pump instabilities N86-30182
Topping turbine (103-JAT) rotor instability in 1150-STPD Kellogg ammonia plants N86-30186
Hydraulic induced instability on a vertical service N86-30189
Remarks on rotor stability (A contribution to discussion during symposium on instability in rotating machinery) N86-30191
Eigenvalues and stability problems of rotors N86-30192
Changes of instability thresholds of rotor due to bearing misalignments N86-30193
Instability in hydraulic machines demonstration rig N86-30199
Cracked rotor demonstration N86-30200

RETARDING
Active flutter suppression on a delta wing model structure
[DFVLR-FB-86-01] N86-29870

REVERSE FIELD PINCH
Technical issues and requirements of experiments and facilities for fusion nuclear technology, FINESSE phase 1, volume 2
[DE86-006500] N86-30511

REYNOLDS NUMBER
Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-176902] N86-29771
External heat transfer study on a HP turbine rotor blade N86-29828

RHEOLOGY
Antimisting fuel technology for transport category aircraft N86-30008
Heat transfer, friction, and rheological characteristics of antimisting kerosene N86-30013

RHODIUM COMPOUNDS
Graph theory in the study of metal cluster bonding topology: Applications to metal clusters having fused polyhedra
[AD-A166623] N86-29937

RIBBON PARACHUTES
Development drop test results of the 15-ft-dia ribbon parachute and 73-ft-dia cross parachute for the US Army Natick Laboratory UHLCADS System
[DE85-017614] N86-29785

RICHARDSON NUMBER
Perturbations of the Richardson number field by gravity waves
[NASA-CR-176910] N86-30273

RING CURRENTS
Latitudinal variation of DS
[INPE-3906-PRE/947] N86-30270

RING LASERS
Pointing alignment by orthogonal phase-lock feedback loops
[DE86-006707] N86-30062
NASA Lidar system support and MOPA technology demonstration
[NASA-CR-178144] N86-30136

RINGS (MATHEMATICS)
Generating ideals in polynomial rings N86-30419

RISK
Application of systems analysis techniques to vulnerability studies of complex installations
[DE86-006012] N86-30223
The physical and empirical basis for a specific clear-air turbulence risk index
[NASA-CR-3971] N86-30285

ROADS
Resilient modulus of freez-thaw affected granular soils for pavement design and evaluation. Part 1: Laboratory tests on soils from Winchendon, Massachusetts, test sections
[FAA/PM-84/16.1] N86-30029

ROBOTICS
Issues in LSI automation, protocol standardization N86-30087
Robotics applications on an advanced hypercube multiprocessor: initial developments
[DE86-008237] N86-30218
Robotic simulation
[DE86-006517] N86-30390
Report on the AI trip
[IR-82] N86-30397

ROBOTS
The design of multirate digital control systems
[NASA-CR-177126] N86-29863
Issues in LSI automation, protocol standardization N86-30087
Repeatability study of a 6-axis robot
[DE86-006417] N86-30210
Robotic simulation
[DE86-006517] N86-30390
Sensor driven robot systems testbed
[DE86-005892] N86-30412

ROBUSTNESS (MATHEMATICS)
Efficient algorithms and structures for robust signal processing
[AD-A166147] N86-30043

ROCKET ENGINES
Oxidizer heat exchanger component testing
[NASA-CR-179487] N86-29901
Fireworks in space
[AD-A166268] N86-29902

ROCKET EXHAUST
Rocket exhaust probe
[AD-D012224] N86-30132
An in-situ measurement of particulates from solid rocket motors fired in space N86-30585

ROCKET LAUNCHING
Infrasound from distant rocket launches
[PB86-182771] N86-30476

ROCKET NOZZLES
Vectored thrust digital flight control for crew escape, volume 1
[AD-A166580] N86-29798

ROCKET OXIDIZERS
Oxidizer heat exchanger component testing
[NASA-CR-179487] N86-29901

ROCKET SOUNDING
Occultation of the ATS-3 satellite by the AVEFRIA barium ion cloud
[DE86-008346] N86-30282

ROLLER BEARINGS
Feasibility study of a discrete bearing/roller drive rotary joint for the space station
[NASA-TM-88600] N86-30206

ROOT-MEAN-SQUARE ERRORS
Improving the interpretability of an aircraft attitude indicator
[AD-A166329] N86-29817

ROSAT MISSION
X-ray satellite (Rosat)
[NASA-TM-88481] N86-29889

ROTARY STABILITY
Instability in Rotating Machinery
[NASA-CP-2409] N86-30160
Full load shop testing of 18,000-hp gas turbine driven centrifugal compressor for offshore platform service: Evaluation of rotor dynamics performance N86-30161
Why have hydrostatic bearings been avoided as a stabilizing element for rotating machines N86-30165
Turbine instabilities: Case histories N86-30166
Two-phase flows within systems with ambient pressure N86-30167
Modeling of elastically mounted vertical rotor N86-30168
Experimental verification and practical application of torquewhirl theory of rotordynamic instability N86-30169
Influence of design parameters on occurence of oil whirl N86-30171
Whirl and whip: Rotor/bearing stability problems N86-30173
Oil seal effects and subsynchronous vibrations in high-speed compressors N86-30176
Effect of coulomb spline on rotor dynamic response N86-30177
Pump instability phenomena generated by fluid forces N86-30181
Vertical reactor coolant pump instabilities N86-30182
Prediction of destabilizing blade tip forces for shrouded and unshrouded turbines N86-30183
Active magnetic bearings for optimum turbomachinery design N86-30186
Rotor internal friction instability N86-30187
Topping turbine (103-JAT) rotor instability in 1150-STPD Kellogg ammonia plants N86-30188
Hydraulic induced instability on a vertical service N86-30189
Aerodynamic instability: A case history N86-30190
Remarks on rotor stability (A contribution to discussion during symposium on instability in rotating machinery) N86-30191
Eigenvalues and stability problems of rotors N86-30192
Changes of instability thresholds of rotor due to bearing misalignments N86-30193
Demonstration of various rotor instabilities (exhibit of Bently Rotor Dynamics Research Corporation Laboratory rigs at symposium on instability in rotaing machinery) N86-30194
Whirl/whip demonstration N86-30195

Anti-swirling demonstration N86-30196
Partial rotor-to-stator rub demonstration N86-30197
Rotor instability due to loose rotating part N86-30198
Instability in hydraulic machines demonstration rig N86-30199
Cracked rotor demonstration N86-30200
Data presentation techniques for rotating machinery malfunction diagnosis N86-30204

ROTATING CYLINDERS
Hydrodynamics and heat transfer in a liquid film under the end of a rotating cylinder
[BLL-M-36755-(5828.4)] N86-30088

ROTATING DISKS
Prediction of transient temperatures for an air-cooled rotating disc N86-29842
Simulation of flow and heat transfer in annular cavities between disks in turbomachinery N86-29855

ROTATING SHAFTS
CO2 compressor vibration and cause analysis N86-30170
Effect of coulomb spline on rotor dynamic response N86-30177
Cracked shaft detection on large vertical nuclear reactor coolant pump N86-30180
Vertical reactor coolant pump instabilities N86-30182
Whirl/whip demonstration N86-30195
Instability in hydraulic machines demonstration rig N86-30199
Rotor/bearing system dynamic stiffness measurements N86-30201
Shaft mode shape demonstration N86-30202
Orbits: Computer simulation N86-30203

ROTATION
Rotating heat transfer investigations on a multi-pass cooling geometry N86-29825
Experimental verification and practical application of torquewhirl theory of rotordynamic instability N86-30169
Influence of design parameters on occurence of oil whirl N86-30171
Whirl and whip: Rotor/bearing stability problems N86-30173
Prediction of destabilizing blade tip forces for shrouded and unshrouded turbines N86-30183
Whirl/whip demonstration N86-30195
Anti-swirling demonstration N86-30196
Feasibility study of a discrete bearing/roller drive rotary joint for the space station
[NASA-TM-88800] N86-30206

ROTOR AERODYNAMICS
An experimental and analytical method for approximate determination of the tilt rotor research aircraft rotor/wing download
[NASA-CR-176970] N86-29769
Simplified examinations of the aerodynamic performances of tip vane rotors
[NLR-M-AT-84-007-L] N86-29787
Estimate of the aerodynamic performances of tip vane rotors using the Helix program
[NLR-TR-85027-L] N86-29788
Aerodynamic research on tip vane rotors, carried out by NLR, and a rough evaluation of the tip vane concept
[NLR-TR-85064-L] N86-29789
Effect of film cooling on the aerodynamic performance of a turbine cascade N86-29859
Full load shop testing of 18,000-hp gas turbine driven centrifugal compressor for offshore platform service: Evaluation of rotor dynamics performance N86-30161

ROTOR BLADES
National Transportation Safety Board safety recommendation
[NTSB-4357/1] N86-29792
Prediction of destabilizing blade tip forces for shrouded and unshrouded turbines N86-30183

ROTOR BLADES (TURBOMACHINERY)
An investigation of tip planform influence on the aerodynamic load characteristics of a semi-span, unswept wing and wing-tip
[NASA-CR-177110] N86-29766
Flap-lag-torsional dynamics of helicopter rotor blades in forward flight
[NASA-CR-176976] N86-29810
External heat transfer study on a HP turbine rotor blade N86-29828
Wake-passing in a turbine rotor cascade N86-29830
Effects of surface roughness on heat transfer to gas turbine blades N86-29832
Effect of film cooling on the aerodynamic performance of a turbine cascade N86-29859
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades N86-29861
The boundary layer behaviour of an advanced gas turbine rotor blade under the influence of simulated film cooling N86-29862
Preliminary instrumentation for aeroelastic tests at the compressor level — turbocompressor test bench
[ONERA-RT-95/7108-RY-054-R] N86-30219
Design and initial testing of a one-bladed 30-meter-diameter rotor on the NASA/DOE mod-O wind turbine
[NASA-TM-88810] N86-30251

ROTOR SPEED
Rotor/bearing system dynamic stiffness measurements N86-30201

ROTORS
Analytical investigation of rotor wake formation and geometry
[NASA-CR-177032] N86-29768
Multi-variable control of the GE T700 engine using the LQG/LTR design methodology
[NASA-CR-177080] N86-29819
Computer simulation of rocket/missile safing and arming mechanism (containing pin pallet runaway escapement, three-pass involute gear train and acceleration driven rotor)
[AD-A166667] N86-29878
Measurement of rotor system dynamic stiffness by perturbation testing N86-30164
Why have hydrostatic bearings been avoided as a stabilizing element for rotating machines N86-30165
Turbine instabilities: Case histories N86-30166
Modeling of elastically mounted vertical rotor N86-30168
Experimental verification and practical application of torquewhirl theory of rotordynamic instability N86-30169
Backward whirl in a simple rotor supported on hydrodynamic bearings N86-30172
Whirl and whip: Rotor/bearing stability problems N86-30173
Analytical prediction of labyrinth-seal-flow-induced arotor excitation forces N86-30175
Effect of coulomb spline on rotor dynamic response N86-30177
Rotor-to-stator rub vibration in centrifugal compressor N86-30178
Measuring dynamic oil film coefficients of sliding bearing N86-30179
Pump instability phenomena generated by fluid forces N86-30181
Magnetic bearings for vibration control N86-30185
Rotor internal friction instability N86-30187
Aerodynamic instability: A case history N86-30190
Remarks on rotor stability (A contribution to discussion during symposium on instability in rotating machinery) N86-30191
Eigenvalues and stability problems of rotors N86-30192
Changes of instability thresholds of rotor due to bearing misalignments N86-30193
Demonstration of various rotor instabilities (exhibit of Bently Rotor Dynamics Research Corporation Laborator rigs at symposium on instability in rotaing machinery) N86-30194
Partial rotor-to-stator rub demonstration N86-30197
Cracked rotor demonstration N86-30200
Shaft mode shape demonstration N86-30202
Orbits: Computer simulation N86-30203
Lorentz invariance and the rotor Doppler shift experiments
[DE86-700614] N86-30473

RUBBER COATINGS
Study of test methods for urethane elastomers
[AD-A166293] N86-29992

RUNWAYS
The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways
[AD-A166485] N86-29804

RYDBERG SERIES
Molecular reaction rates
[AD-A166518] N86-30479

S

SAFETY
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] N86-29806
Subsystem hazard analysis for the LSI models 6216A, B and C self-contained navigation sysgem group A
[AD-A166816] N86-29807
Aerospace Safety Advisory Panel report to the NASA acting administrator
[NASA-TM-89226] N86-29879
Wind turbine fatigue considerations
[DE86-006499] N86-30257

SAFETY FACTORS
Extreme winds and tornadoes: An overview
[DE86-006162] N86-30294

SALINITY
An introduction to ice in the polar oceans
[AD-A166140] N86-30298
Continental shelf processes affecting the oceanography of the South Atlantic Bight
[DE86-008212] N86-30301

SAMPLING
Quality assurance for water sampling
[AD-A165842] N86-30263
Selecting the best population, a decision theoretic approach: The case of Pareto distribution
[AD-A166152] N86-30449

SANDS
A procedure for evaluation of dust potential in desert terrains
[AD-A166491] N86-30245

SANDWICH STRUCTURES
Investigation of basic characteristics of laser heating in thermoluminescence and of laser-stimulated luminescence
[AD-A166089] N86-30138

SATELLITE ANTENNAS
Proceedings of the 1985 Antenna Applications Symposium, volume 1
[AD-A166754] N86-30048

SATELLITE ATTITUDE CONTROL
A self-tuning regulator based on pole placement design for use in satellite attitude control
[INPE-3861-PRE/924] N86-29887

SATELLITE CONTROL
An overview of the Kaliningrad Spaceflight Control Center
[NASA-TM-87980] N86-29876

SATELLITE DESIGN
Report on the phase A study of a joint Indonesian-Netherlands Tropical Earth Resources Satellite (TERS) program
[JTERS-84-10] N86-30249

SATELLITE GROUND SUPPORT
An overview of the Kaliningrad Spaceflight Control Center
[NASA-TM-87980] N86-29876

SATELLITE INSTRUMENTS
The Delft University of Technology Scatterometer (DUTSCAT) report — ESA C-band wind scatterometer
[ESA-86-97550] N86-30059

SATELLITE OBSERVATION
Atmospheric, climatic and environmental research
[NASA-CR-176880] N86-30287

SATELLITE ORBITS
Use of a virtual control approach in state estimation
[INPE-3903-PRE/944] N86-30453

SATELLITE TELEVISION
A satellite broadcast receiving terminal
[ESA-86-97317] N86-30057

SATELLITE TRANSMISSION
Modeling and equalization of nonlinear bandlimited satellite channels N86-30071

SATELLITE-BORNE INSTRUMENTS
Imaging and sounding instruments in the spin stabilized version of the second generation Meteosat
[REPT-60/1568] N86-29690

SATELLITE-BORNE PHOTOGRAPHY
Factors leading to the formation of arc cloud complexes
[AD-A166501] N86-30291

SAWTOOTH WAVEFORMS
Enhanced small scale turbulence oscillations correlated to sawtooth relaxations in the TEXTOR tokamak
[JUEL-2025] N86-30515

SCANDIUM
Spectroscopic, optical and thermo-mechanical properties of GSGG and its laser performance
[DE86-005773] N86-30156
Research in Gadolinium Scandium Gallium Garnet (GSGG) crystal development
[DE86-004292] N86-30532

SCATTERING
A multiple Gaussian wave packet theory of H2 diffraction and rotational excitation by collision with solid surfaces
[AD-A166291] N86-30529

SCATTERING CROSS SECTIONS
Orientation effects and fine structure transitions in differential scattering cross sections
[MPIS-15/1985] N86-30481
Scattering and absorption of light due to surface resonances on submicron oblate spheroidal particulates
[DE86-005261] N86-30500

SCATTEROMETERS
The Delft University of Technology Scatterometer (DUTSCAT) report — ESA C-band wind scatterometer
[ESA-86-97550] N86-30059

The ESA C-band wind scatterometer campaign: Preliminary campaign definition
[ESA-86-97552] N86-30060
The ESA C-band wind scatterometer campaign: Data processing
[ESA-86-97555] N86-30061

SCHEDULING
Study of onboard expert systems to augment space shuttle and space station autonomy
[NASA-CR-176958] N86-29886

SCHLIEREN PHOTOGRAPHY
Wake-passing in a turbine rotor cascade N86-29830

SCHROEDINGER EQUATION
Piecewise analytical perturbation series methods for solving linear ordinary differential equations. Part 2: The radial Schroedinger equations
[DE86-700606] N86-30438
AGgaussian wave packet method for studying time dependent quantum mechanics in a curve crossing system: Low energy motion, tunneling and thermal dissipation
[AD-A166262] N86-30558
Nonlinear temporal modulation of pulsar radioemission
[DE86-700670] N86-30626

SCIENTISTS
United States Air Force Summer Faculty Research Program, 1985 technical report, volume 1
[AD-A166176] N86-30562
United States Air Force Summer Faculty Research Program, 1985 technical report, volume 2
[AD-A166177] N86-30563
United States Air Force Summer Faculty Research Program 1985 technical report, volume 3
[AD-A166178] N86-30564

SEA ICE
An introduction to ice in the polar oceans
[AD-A166140] N86-30298
Mechanical properties of multi-year sea ice. Phase 2: Test results
[AD-A166333] N86-30299

SEA SURFACE TEMPERATURE
The stability of low-latitude sea-surface temperatures: An evaluation of the CLIMAP reconstruction with emphasis on the positive SST anomalies
[DE85-016190] N86-30300

SEALING
Full load shop testing of 18,000-hp gas turbine driven centrifugal compressor for offshore platform service: Evaluation of rotor dynamics performance N86-30161

SEALS (STOPPERS)
Some new results concerning the dynamic behavior of annular turbulent seals N86-30174
Oil seal effects and subsynchronous vibrations in high-speed compressors N86-30176
Identification of bearing and seal dynamic stiffness parameters N86-30184
Whirl/whip demonstration N86-30195
Anti-swirling demonstration N86-30196

SECONDARY EMISSION
Comparative studies of electron affinities and work functions for GaAs amd Si
[AD-A166225] N86-30523

SECONDARY FLOW
Theory and experimental study of a 3-D jet introduced into the secondary flow of a turbine inlet guide vane N86-29860

SECURITY
Application of systems analysis techniques to vulnerability studies of complex installations
[DE86-006012] N86-30223

SEDIMENTS
Comparison of extraction techniques and solvents for explosive residues in soil
[AD-A166474] N86-30026

SEISMOLOGY
Estimation of discontinuous coefficients and boundary parameters for hyperbolic systems
[NASA-CR-178133] N86-30424

SELF ADAPTIVE CONTROL SYSTEMS
A self-tuning regulator based on pole placement design for use in satellite attitude control
[INPE-3861-PRE/924] N86-29887

SELF CONSISTENT FIELDS
On the extension of the MCSCF/CI method
[NASA-CR-176933] N86-29924
The nature of chemisorbed oxygen on Ni(100) and Cu(100) N86-29925
A final report on the extension of the MCSCF/CI method N86-29926
Charging and hybridization in the finite cluster model N86-29927
On the low-lying states of CuO N86-29928
Theoretical research program to study chemical reactions in AOTV bow shock tubes
[NASA-CR-176992] N86-30373
Integral processing in beyond-Hartree-Fock calculations N86-30374
Benchmark full configuration-interaction calculations on H2O, F- and F N86-30375
Benchmark full configuration-interaction calculations on HF and NH2 N86-30376
On the electron affinity of the oxygen atom N86-30377

SELF INDUCED VIBRATION
Analytical prediction of labyrinth-seal-flow-induced arotor excitation forces N86-30175
Rotor internal friction instability N86-30187

SEMANTICS
Artificial intelligence indexing: Creating knowledge bases of index terms ordered by semantic relations
[AD-A166768] N86-30574

SEMICONDUCTING FILMS
Superconducting electronic film structures
[AD-A166183] N86-30522
Contributions of electron microscopy to the understanding of reactions on compound semiconductor surfaces
[DE86-005230] N86-30533

SEMICONDUCTOR DEVICES
500 MHz CCD serial analog memory
[DE86-901019] N86-30084
Selective low-pressure silicon epitaxy
[BMFT-FB-T-85-133] N86-30553

SEMICONDUCTOR JUNCTIONS
A superconducting tunnel junction receiver for millimeter-wave astronomy
[NASA-TM-87792] N86-30517

SEMICONDUCTOR LASERS
A conductively cooled laser diode array pumped laser
[AD-D012217] N86-30143
Numerical simulation of gain-guided diode laser arrays
[DE86-007833] N86-30157

SEMICONDUCTORS (MATERIALS)
Investigation of basic characteristics of laser heating in thermoluminescence and of laser-stimulated luminescence
[AD-A166089] N86-30138
Semiconducting transition metal silicides for electro-optic VSLI interconnects
[AD-A165895] N86-30519
Contributions of electron microscopy to the understanding of reactions on compound semiconductor surfaces
[DE86-005230] N86-30533

SENSITIVITY
Effect of Reynolds Number and Mach Number on flow angularity probe sensitivity
[NASA-TM-87750] N86-29774
Determination of relative sensitivity factors for use in spark-source mass spectrometry
[DE86-700715] N86-29942

SEPARATED FLOW
Preliminary research on post-stall aerodynamics
[AD-A166279] N86-29780
Separated flows near the nose of a body of revolution
[NASA-CR-177107] N86-30091

SEQUENCING
Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025

SEQUENTIAL CONTROL
Vectored thrust digital flight control for crew escape, volume 2
[AD-A166596] N86-29799

SERIES (MATHEMATICS)
Piecewise analytical perturbation series methods for solving linear ordinary differential equations. Part 2: The radial Schroedinger equations
[DE86-700606] N86-30438

SERVICE LIFE
National Transportation Safety Board safety recommendation
[NTSB-4357/1] N86-29792
Syn-fuel reciprocating charge pump improvement program
[DE86-007482] N86-30216

SET THEORY
Generating ideals in polynomial rings N86-30419
Chebyshev sets and continuous position
[IR-245] N86-30464
Critical sets in parametric optimization
[ESA-86-97358] N86-30466

SHAPES
Novel architectures for image processing based on computer simulation and psychophysical studies of human visual cortex
[AD-A166222] N86-30333

SHEAR FLOW
Motion and interaction of decaying trailing vortices in spanwise shear wind
[NASA-TP-2599] N86-29762
Perturbations of the Richardson number field by gravity waves
[NASA-CR-176910] N86-30273

SHEAR PROPERTIES
Use of miniaturized tests to predict flow properties and estimate fracture toughness in deformed steel plates
[DE86-007644] N86-29981
Strength characterization method for evaluating ceramic-to-metal bonds
[DE86-007526] N86-30225
Effect of interfacial phenomena on contact line heat transfer, 1
[AD-A166088] N86-30557

SHIFTING EQUILIBRIUM FLOW
Experimental observation of the structure of shock waves in dusty gas
[AD-A166301] N86-30103

SHOCK TESTS
Experimental observation of the structure of shock waves in dusty gas
[AD-A166301] N86-30103

SHOCK TUBES
Two spot laser velocimeter measurements of velocity and turbulence intensity in shock tube driven turbine flows N86-29853
Experimental observation of the structure of shock waves in dusty gas
[AD-A166301] N86-30103

SHOCK WAVES
An entropy correction method for unsteady full potential flows with strong shocks
[NASA-TM-87769] N86-29777
The boundary layer behaviour of an advanced gas turbine rotor blade under the influence of simulated film cooling N86-29862
Shuttle contamination modeling: The plasma wave field of spacecraft
[AD-A166605] N86-29880
Electronic spectra of various liquids under shock conditions
[AD-A166510] N86-29936
Experimental observation of the structure of shock waves in dusty gas
[AD-A166301] N86-30103
Radiating shocks and condensations in flares
[DE86-005620] N86-30622

SHORT CRACKS
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A166466] N86-29968

SHROUDED TURBINES
Prediction of destabilizing blade tip forces for shrouded and unshrouded turbines N86-30183

SHROUDS
Shroud segments for unshrouded blade turbines N86-29835
Convective heat transfer from circular cylinders located within perforated cylindrical shrouds
[NASA-CR-4005] N86-30100

SIDE-LOOKING RADAR
Internal Side-looking Airborne Radar (SLAR) calibration
[I85.68220.002] N86-30062
Wave observation at sea with the Dutch Side-Looking Airborne Radar (SLAR)
[I83.533.005] N86-30063

SIDELOBES
A review of phase-only sidelobe nulling investigations at RADC (Rome Air Development Center)
[AD-A166602] N86-30045

SIGNAL DETECTION
Connection of high-temperature strength and structural state of steel 12KhIMF with parameters of signals of acoustic emission under tension
[BLL-M-36738-(5828.4)] N86-29953
Efficient algorithms and structures for robust signal processing
[AD-A166147] N86-30043

SIGNAL FADING
Study of multipath fading in line of sight radio links: Bibliography summary
[CRPE-NT-133] N86-30056

SIGNAL PROCESSING
Analogue signal conditioning for flight test instrumentation
[AGARD-AG-160-VOL-17] N86-29816
The design of multirate digital control systems
[NASA-CR-177126] N86-29863
Efficient algorithms and structures for robust signal processing
[AD-A166147] N86-30043
Multichannel relative-entropy spectrum analysis
[AD-A166625] N86-30046
Adaptive microwave channelization
[AD-D012215] N86-30050

A survey of the state of the art and focused research in range systems, task 2
[NASA-CR-176988] N86-30069
On realizations of least-squares estimation and Kalman filtering by systolic arrays N86-30072
A 3-component laser-Doppler velocimeter data acquisition and reduction system
[NASA-CR-176929] N86-30135
A digital filter for removing known components from spectroscopic data
[AD-A166680] N86-30385

SILICIDES
Semiconducting transition metal silicides for electro-optic VSLI interconnects
[AD-A165895] N86-30519

SILICON
Double-injection, deep-impurity switch development
[NASA-CR-174936] N86-30073
Laser induced oxidation of heavily doped silicon
[DE86-006212] N86-30153
Rapid thermal processing of ion implanted silicon as a viable solar cell technology
[DE86-008216] N86-30259
Comparative studies of electron affinities and work functions for GaAs amd Si
[AD-A166225] N86-30523

SILICON ALLOYS
Electrochemical photocapacitance spectroscopy of amorphous silicon alloy materials
[DE86-004421] N86-30546
Anomalous behavior during the solidification of silicon in the presence of impurities
[DE86-007395] N86-30548

SILICON CARBIDES
Ceramic heat exchangers for gas turbines or turbojet engines N86-29858
Carbon-rich ceramic composites from ethynyl aromatic precrusors
[NASA-TM-88812] N86-29908
Effects of thermal and cyclic loads on silicon carbide yarn reinforced glass matrix composites
[DE86-006793] N86-29913
Performance of commercial and research grade SiC whiskers in a borosilicate glass matrix
[DE86-007379] N86-29914
Compilation of information on commercially available ceramic coatings for high-temperature applications
[DE86-006740] N86-30002

SILICON FILMS
Light-induced excess conductivity and the role of argon in the deposition of doping-modulated amorphous silicon superlattices
[DE86-005812] N86-30535
Selective low-pressure silicon epitaxy
[BMFT-FB-T-85-133] N86-30553

SILICON JUNCTIONS
Thermal sensing of cryogenic wind tunnel model surfaces
[NASA-CR-178136] N86-30098

SILICON NITRIDES
Combustion synthesis of Si3N4 and AlN
[DE86-006530] N86-29940

SILICON POLYMERS
Chemistry of new silicon containing polymers triply bonded silicon intermediates
[AD-A166085] N86-29990

SILVER
Determination of relative sensitivity factors for use in spark-source mass spectrometry
[DE86-700715] N86-29942

SIMULATION
Stability and control of compressible flows over a surface with concave-conves curvature
[NASA-CR-178143] N86-29775
Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025
Macromodeling and optimization of digital MOS VLSI circuits
[AD-A166658] N86-30075
Numerical and experimental studies of particle flow in a high-pressure boundary-layer wind tunnel
[NASA-CR-177008] N86-30092
An investigation of the use of steady-state evoked potentials for human performance and workload assessment and control
[AD-A166205] N86-30332
Robotic simulation
[DE86-006517] N86-30390
Sonic-boom research: Selected bibliography with annotation
[NASA-TM-87685] N86-30470
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A166273] N86-30526

SIMULATORS
Technology research for strapdown inertial experiment and digital flight control and guidance
[NASA-CR-176907] N86-29800
Remote access for NAS: Supercomputing in a university environment
[NASA-CR-177020] N86-30370

SINGLE CRYSTALS
Investigation of oxide and fluoride hosts for blue-green lasers
[AD-A166620] N86-30142
Superconductivity of thin film intermetallic compounds
[AD-A166271] N86-30525
Ferroelectric tungsten bronze crystals for far infrared electro-optic device applications
[AD-A166484] N86-30531
Point defects and high-temperature deformation of NiO
[DE86-005560] N86-30534

SINGULARITY (MATHEMATICS)
Calculations of axisymmetric vortex sheet roll-up using a panel and a filament model
[NASA-CR-177081] N86-29767

SINTERING
Combustion synthesis of Si3N4 and AlN
[DE86-006530] N86-29940
Process of structure formation of sintered steel Kh6V3M
[BLL-M-36781-(5828.4)] N86-29957
Relation between microstructural heterogeneous surface layer and nitrogen pressure during sintering in Si3N4-MI2O3 ceramics
[NASA-TM-88409] N86-29968

SIS (SEMICONDUCTORS)
A superconducting tunnel junction receiver for millimeter-wave astronomy
[NASA-TM-87792] N86-30517

SITE SELECTION
Pacific Northwest Wind Regional Energy Assessment Program. Volume 2. Appendix
[DE86-007114] N86-30296

SIZE DETERMINATION
Cosmic dust detection with large surface piezoceramics N86-30604

SKEWNESS
Model-following control for an oblique-wing aircraft
[NASA-TM-88269] N86-29867

SKIN FRICTION
Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-176902] N86-29771

SKIN TEMPERATURE (BIOLOGY)
Thermoregulation after atropine and pralidoxime administration
[AD-A165868] N86-30304

SLENDER CONES
Comparisons of CFD flow field solutions with experimental data at Mach 14
[DE86-004915] N86-29784

SLICING
Thin-sectioning and microanalysis of individual extraterrestrial particles N86-30586

SLURRIES
Continuous inline blending of antimisting kerosene N86-30015

SMOOTHING
Thermal smoothing of rough surfaces in vacuo
[NASA-TM-88425] N86-29961

SOCIAL FACTORS
Visual aerial photograph texture discrimination for delineating homogeneous residential sectors: An instrument for urban planners
[INPE-3896-PRE/938] N86-30244
Implications of privacy needs and interpersonal distancing mechanisms for space station design
[NASA-CR-176938] N86-30338

SOCIAL ISOLATION
Implications of privacy needs and interpersonal distancing mechanisms for space station design
[NASA-CR-176938] N86-30338

SODIUM
Studies on radiative collisional and ultraviolet lasers
[AD-A166193] N86-30139

SOFTWARE ENGINEERING
Integrated research in constitutive modelling at elevated temperatures, part 1
[NASA-CR-177237] N86-30227
Integrated research in constitutive modelling at elevated temperatures: Summary of the project N86-30228
Proceedings of Tenth Annual Software Engineering Workshop
[NASA-TM-88780] N86-30357
Measuring the software process and product: Lessons learned in the SEL N86-30358
Studies and experiments in the Software Engineering Lab (SEL) N86-30359
Software management tools: Lessons learned from use N86-30360
DEASEL: An expert system for software engineering N86-30361
Quality assurance software inspections at NASA Ames: Metrics for feedback and modification N86-30363
A knowledge based software engineering environment testbed N86-30364
Experience with a software engineering environment framework N86-30365
One approach for evaluating the Distributed Computing Design System (DCDS) N86-30366
Experiments with Ada N86-30367
Observations from a prototype implementation of the Common APSE Interface Set (CAIS) N86-30368
Measuring Ada as a software development technology in the Software Engineering Laboratory (SEL) N86-30369
The status of verification technology for the Ada (Trademark) language
[AD-A166664] N86-30384
A relational database environment for software development
[IR-86] N86-30398
Translation table for DOE/OSTI - COSATI bibliographic records to MARC format records
[DE86-006473] N86-30576
Records, documentation storage and retrieval system, phase 2
[DE86-007219] N86-30577

SOFTWARE TOOLS
MECHAN: Dynamic analysis of planar mechanisms
[DE85-018023] N86-30214
Proceedings of Tenth Annual Software Engineering Workshop
[NASA-TM-88780] N86-30357
Software management tools: Lessons learned from use N86-30360
One approach for evaluating the Distributed Computing Design System (DCDS) N86-30366
Search and retrieval of office files using dBASE 3
[NASA-TM-86550] N86-30378
Dynamic remapping of parallel computations with varying resource demands
[NASA-CR-178150] N86-30379
A relational database environment for software development
[IR-86] N86-30398
Exception handling constructs considered unnecessary — computer programming
[INF-84-8] N86-30401

SOIL MECHANICS
Resilient modulus of freez-thaw affected granular soils for pavement design and evaluation. Part 1: Laboratory tests on soils from Winchendon, Massachusetts, test sections
[FAA/PM-84/16.1] N86-30029

SOILS
Comparison of extraction techniques and solvents for explosive residues in soil
[AD-A166474] N86-30026

SOLAR ACTIVITY
Longitudinal difference in the Sq profiles in the South American region
[INPE-3944-PRE/986] N86-30271

SOLAR ARRAYS
Design considerations for stand-alone photovoltaic systems
[DE86-006470] N86-30253

SOLAR CELLS
Applications of laser annealing and laser-induced diffusion to photovoltaic conversion
[DE86-003809] N86-30254
High intensity solar cells
[DE86-006550] N86-30255
Gallium arsenide and multibandgap solar cell research
[DE85-016894] N86-30256
Research on high-efficiency, single-junction, monolithic, thin-film amorphous silicon solar cells
[DE86-004420] N86-30258
Rapid thermal processing of ion implanted silicon as a viable solar cell technology
[DE86-008216] N86-30259
Laser-assisted solar cell metallization processing
[DE86-008328] N86-30260
Cermet fuels for space power systems
[DE86-005543] N86-30490

SOLAR COSMIC RAYS
Charge states of energetic solar particles
[MPE-195] N86-30623

SOLAR FLARES
Radiating shocks and condensations in flares
[DE86-005620] N86-30622
Charge states of energetic solar particles
[MPE-195] N86-30623

SOLAR GENERATORS
Cermet fuels for space power systems
[DE86-005543] N86-30490
SOLAR MAXIMUM MISSION
The solar maximum satellite capture cell: Impact features and orbital debris and micrometeoritic projectile materials N86-30598
SOLAR PHYSICS
Research and development activities of the Indian Institute of Geomagnetism N86-30274
SOLAR PLANETARY INTERACTIONS
Preliminary development of a global 3-D magnetohydrodynamic computational model for solar wind-cometary and planetary interactions
[NASA-CR-177090] N86-30621
SOLAR RADIATION
Proceedings of the Ninth DOE Solar Photochemistry Research Conference
[DE86-006167] N86-30252
SOLAR WIND
Research and development activities of the Indian Institute of Geomagnetism N86-30274
Preliminary development of a global 3-D magnetohydrodynamic computational model for solar wind-cometary and planetary interactions
[NASA-CR-177090] N86-30621
SOLID ELECTROLYTES
X-ray studies of the solid-electrolyte interface
[DE86-003639] N86-29943
SOLID PHASES
Topics in precipitation and ordering reactions and their related phenomena
[DE86-007483] N86-30549
SOLID PROPELLANT ROCKET ENGINES
Tension strength of a thick graphite/epoxy laminate after impact by a 1/2-in. radius impactor
[NASA-TM-87771] N86-29907
An in-situ measurement of particulates from solid rocket motors fired in space N86-30585
SOLID STATE
Electronics Division research and development
[DE86-008327] N86-30083
SOLID STATE LASERS
Investigation of oxide and fluoride hosts for blue-green lasers
[AD-A166620] N86-30142
Development of a solid state laser of Nd:YLF
[DE86-700770] N86-30147
Spectroscopic, optical and thermo-mechanical properties of GSGG and its laser performance
[DE86-005773] N86-30156
SOLID SURFACES
A multiple Gaussian wave packet theory of H2 diffraction and rotational excitation by collision with solid surfaces
[AD-A166291] N86-30529
SOLID-SOLID INTERFACES
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166242] N86-30524
SOLIDIFICATION
Solidification dynamics and microstructure of metals in pulsed laser irradiation
[DE86-002169] N86-29972
Nucleation of allotropic phases during pulsed laser annealing of manganese
[DE86-004584] N86-29973
Anomalous behavior during the solidification of silicon in the presence of impurities
[DE86-007395] N86-30548
SOLIDS
Certain rules governing damping of vibrations in two-phase alloys
[BLL-M-36760-(5828.4)] N86-29954
Transient heat conduction in semi-infinite solids with temperature dependent properties
[AD-A166613] N86-30105
A simple nonlinear joint model
[NASA-TM-87749] N86-30234
SOLITARY WAVES
The magnetic effects of shallow water internal solitons
[AD-A165852] N86-30297
SOLUTIONS
Interfacial tension of demixed polymer solutions
[DE86-003035] N86-30000
SOLVENT EXTRACTION
Comparison of extraction techniques and solvents for explosive residues in soil
[AD-A166474] N86-30026
Modeling of flow fields in oscillating droplets
[DE86-008232] N86-30119
SONIC BOOMS
Sonic-boom research: Selected bibliography with annotation
[NASA-TM-87685] N86-30470
SORPTION
Detection of chemical vapor mixtures by sorption on multiple piezoelectric crystals
[DE86-006698] N86-29941
SOUND INTENSITY
Investigation of the aerodynamic performance and noise characteristics of a 1/5th scale model of the Dowty Rotol R212 propeller
[RAE-TM-AERO-1983] N86-30468
SOUND LOCALIZATION
Auditory helicopter detection and localization; a literature review focusing on search for helicopters
[FOA-C-50033-H2] N86-30474
SOUND TRANSMISSION
Nonlinear effects in long range underwater acoustic propagation
[AD-A166492] N86-30472
SOUNDING ROCKETS
Positive Ion Ejection System (PIES)
[AD-A166560] N86-29894
Turbulent heating and transfer in the stratosphere and lower mesosphere
[AD-A166591] N86-30276
SOUTHERN HEMISPHERE
Grid point surface air temperature data set for the Southern Hemisphere
[DE86-007205] N86-30295
SPACE CHARGE
Positive Ion Ejection System (PIES)
[AD-A166560] N86-29894
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895
SPACE COLONIES
Toward a permanent lunar settlement in the coming decade: the Columbus Project
[DE86-006709] N86-29874
SPACE DEBRIS
An in-situ measurement of particulates from solid rocket motors fired in space N86-30585
The use of tethered satellites for the collection of cosmic dust and the sampling of man made orbital debris far from the space station N86-30589
Orbital debris measurements N86-30593
Acoustic penetration and impact detector for micrometeoroid and space debris application N86-30594
Stratospheric dust collections: Valuable resources for space and atmospheric scientists N86-30596
The solar maximum satellite capture cell: Impact features and orbital debris and micrometeoritic projectile materials N86-30598
SPACE ENVIRONMENT SIMULATION
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895
SPACE ERECTABLE STRUCTURES
A simple nonlinear joint model
[NASA-TM-87749] N86-30234
SPACE EXPLORATION
Manned Mars missions: A working group report
[NASA-TM-88777] N86-29873
Proceedings of the 2nd Annual Conference on NASA/University Advanced Space Design Program
[NASA-TM-89399] N86-29888
SPACE HEATING (BUILDINGS)
Influence of conditions on the performance of small heat pumps
[DE86-751178] N86-30115
SPACE INFRARED TELESCOPE FACILITY
Space infrared telescope pointing control system. Automated star pattern recognition
[NASA-CR-176911] N86-30608
SPACE LOGISTICS
Study of onboard expert systems to augment space shuttle and space station autonomy
[NASA-CR-176958] N86-29886
SPACE MISSIONS
Manned Mars missions: A working group report
[NASA-TM-88777] N86-29873
SPACE PERCEPTION
Spatiotemporal characteristics of visual localization
[AD-A166097] N86-30331
SPACE PROGRAMS
Hungarian space research 1981-1985: Lectures and review articles
[NASA-TM-87992] N86-30580
SPACE PSYCHOLOGY
Implications of privacy needs and interpersonal distancing mechanisms for space station design
[NASA-CR-176938] N86-30338
SPACE SHUTTLE BOOSTERS
Tension strength of a thick graphite/epoxy laminate after impact by a 1/2-in. radius impactor
[NASA-TM-87771] N86-29907
SPACE SHUTTLE MAIN ENGINE
Failure control techniques for the SSME, phase 1
[NASA-CR-178645] N86-29900
Non-intrusive speed sensor
[NASA-CR-178873] N86-30125
Bearing tester data compilation analysis, and reporting and bearing math modeling
[NASA-CR-176909] N86-30205
SPACE SHUTTLE ORBITERS
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] N86-30233
SPACE SHUTTLE PAYLOADS
Cryogenic explosion environment modeling and testing of space shuttle and light-weight radioisotope heater unit interactions
[DE86-005901] N86-29881
Satellites said to function well, plans revealed N86-29898
Life Sciences Space Station planning document: A reference payload for the Life Sciences Research Facility
[NASA-TM-89188] N86-30302
SPACE SHUTTLES
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] N86-29772
A radar data processing and enhancement system
[NASA-TM-88274] N86-29864
Applications of satellite meteorology in support of space shuttle
[AD-A166227] N86-30288
SPACE STATIONS
Aerospace Safety Advisory Panel report to the NASA acting administrator
[NASA-TM-89226] N86-29879
Development of composite tube protective coatings
[NASA-CR-178116] N86-29980
Feasibility study of a discrete bearing/roller drive rotary joint for the space station
[NASA-TM-88600] N86-30206
Life Sciences Space Station planning document: A reference payload for the Life Sciences Research Facility
[NASA-TM-89188] N86-30302
SPACE TRANSPORTATION SYSTEM
Aerospace Safety Advisory Panel report to the NASA acting administrator
[NASA-TM-89226] N86-29879
SPACE WEAPONS
Anti-satellite weapons, countermeasures, and arms control
[PB86-182953] N86-30031
SPACE-TIME FUNCTIONS
Internal wave motion
[NASA-CR-178871] N86-30275
SPACEBORNE EXPERIMENTS
Study of onboard expert systems to augment space shuttle and space station autonomy
[NASA-CR-176958] N86-29886
An in-situ measurement of particulates from solid rocket motors fired in space N86-30585
A micrometeoroid deceleration and capture experiment: Conceptual experiment design description N86-30605
SPACECRAFT COMMUNICATION
Coding for reliable satellite communications
[NASA-CR-177262] N86-30035
SPACECRAFT COMPONENTS
Charge accumulation and arc discharges on spacecraft materials and components
[AD-A166216] N86-29893
SPACECRAFT CONSTRUCTION MATERIALS
Effects of the low Earth orbital environment on spacecraft materials N86-30595
SPACECRAFT DESIGN
Manned Mars missions: A working group report
[NASA-TM-88777] N86-29873
Structures and Dynamics Division research and technology plans for FY 1986 and accomplishments for FY 1985
[NASA-TM-87742] N86-30235
SPACECRAFT ENVIRONMENTS
Shuttle contamination modeling: The plasma wave field of spacecraft
[AD-A166605] N86-29880
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895
SPACECRAFT POWER SUPPLIES
The electrification of spacecraft
[NASA-TM-77653] N86-29885
General-Purpose Heat Source safety verification test series: SVT-1 through SVT-6
[DE85-017956] N86-30489
Cermet fuels for space power systems
[DE86-005543] N86-30490
Space Nuclear Safety Program
[DE86-007197] N86-30492
Space Nuclear Safety Program
[DE86-007206] N86-30493

SPACECRAFT RADIATORS
Study of heat exchangers between a liquid loop feeder and a heat-pipe radiator --- spacecraft thermal control
[FOK-TR-R-84-108] N86-30089
SPACECRAFT SHIELDING
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895
SPACECRAFT STRUCTURES
Structures and Dynamics Division research and technology plans for FY 1986 and accomplishments for FY 1985
[NASA-TM-87742] N86-30235
SPACECREWS
Study of onboard expert systems to augment space shuttle and space station autonomy
[NASA-CR-176958] N86-29886
Specifications Physiological Monitoring System
[NASA-CR-171926] N86-30339
SPACELAB
A study of NO gamma bands in the mesosphere from spacelab 1
[AD-A166852] N86-30279
SPACING
Varied line-space gratings: past, present and future
[DE86-007498] N86-30503
SPARK IGNITION
Discussion of turbulent flame structure in premixed charges
[DE86-008174] N86-29948
SPATIAL FILTERING
New acousto-optical beam former --- for linear antenna arrays
[BMFT-FB-T-85-154] N86-30504
SPECIES DIFFUSION
The stability of low-latitude sea-surface temperatures: An evaluation of the CLIMAP reconstruction with emphasis on the positive SST anomalies
[DE85-016190] N86-30300
SPECIFIC HEAT
Development of accurate estimation methods for calculating heat capacities of refractory materials
[DE86-004242] N86-30559
SPECTRAL BANDS
A study of NO gamma bands in the mesosphere from spacelab 1
[AD-A166852] N86-30279
SPECTRAL METHODS
Spectral study of turbulence. Pure rotation and introduction to mode composition
[ESA-86-97273] N86-30121
Preconditioning for first-order spectral discretization
[NASA-TM-87619] N86-30427
SPECTRAL SENSITIVITY
The effect of spectrally selective filters on visual search performance
[AD-A165835] N86-30329
SPECTROMETERS
A study of NO gamma bands in the mesosphere from spacelab 1
[AD-A166852] N86-30279
SPECTROPHOTOMETRY
Chalcogenide glasses. Part 2: Optical thickness temperature relation in chalcogenide glass films
[AD-A166589] N86-29995
SPECTROSCOPIC ANALYSIS
Laser microprobe study of cosmic dust (IDPs) and potential source materials N86-30591
Laser microprobe characterization of C species in Interplanetary Dust Particles (IDP) N86-30600
SPECTROSCOPY
Basic elements of nuclear geophysics
[DE86-700735] N86-30243
A digital filter for removing known components from spectroscopic data
[AD-A166680] N86-30385
Electrochemical photocapacitance spectroscopy of amorphous silicon alloy materials
[DE86-004421] N86-30546
SPECTRUM ANALYSIS
Wave propagation measurements on two-dimensional lattice
[AD-A166207] N86-29891
Efficient algorithms and structures for robust signal processing
[AD-A166147] N86-30043
Multichannel relative-entropy spectrum analysis
[AD-A166625] N86-30046
A study of NO gamma bands in the mesosphere from spacelab 1
[AD-A166852] N86-30279
A digital filter for removing known components from spectroscopic data
[AD-A166680] N86-30385
SPEED INDICATORS
Non-intrusive speed sensor
[NASA-CR-178873] N86-30125
SPHERICAL SHELLS
Hollow droplet generator for polymer shell production
[DE86-006482] N86-29999
SPIN DYNAMICS
Spin-coated amorphous chalcogenide resists spin-coated amorphous chalcogenide glasses
[AD-A166270] N86-29991
SPIRAL ANTENNAS
Test configuration and procedure for determining the operational status of a phased array antenna
[AD-D012216] N86-30051
SPLINE FUNCTIONS
Estimation of discontinuous coefficients and boundary parameters for hyperbolic systems
[NASA-CR-178133] N86-30424
SPRAYERS
Computation of dense spray jets
[DE86-008176] N86-30118
SPRINGS (ELASTIC)
Properties of spring steels hardened in polymer-bearing medium
[BLL-M-36734-(5828.4)] N86-29952
SPUTTERING
Production and properties of metallic superlattices
[DE86-003058] N86-29970
Cosmic X-ray physics
[NASA-CR-177227] N86-30624
SQUARE WAVES
Walsh-Fourier analysis of discrete-valued time series
[AD-A166139] N86-30430
STABILITY
Stability and control of compressible flows over a surface with concave-convex curvature
[NASA-CR-178143] N86-29775
Experience with synchronous and asynchronous digital control systems
[NASA-TM-88271] N86-29866
On compactness of admissible parameter sets: Convergence and stability in inverse problems for distributed parameter systems
[NASA-CR-178128] N86-30423
Resistive instabilities in tokamaks
[DE86-002538] N86-30510
Stability of surface nucleation
[NASA-TM-88806] N86-30556
STABILITY AUGMENTATION
Radiative augmented combustion
[AD-A166185] N86-29932
STABILITY TESTS
Instability analysis procedure for 3-level multi-bearing rotor-foundation systems N86-30162
Simulation of non-linear bearing forces for post-stability investigation N86-30163
STABILIZATION
Advanced laser based inertial instrument development
[AD-A166307] N86-30128
STABILIZERS (FLUID DYNAMICS)
Magnus effect: An overview of its past and future practical applications, 1850-1985, volumes 1 and 2
[AD-A165902] N86-30102
STAGNATION PRESSURE
Experiments on high speed ejectors
[NASA-CR-177419] N86-29820
STAINLESS STEELS
Connection of high-temperature strength and structural state of steel 12KhIMF with parameters of signals of acoustic emission under tension
[BLL-M-36738-(5828.4)] N86-29953
Investigations of creep cavitation in type 304 stainless steel
[DE86-007187] N86-29978
Transient heat conduction in semi-infinite solids with temperature dependent properties
[AD-A166613] N86-30105
STANDARDS
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] N86-29801
Determination of relative sensitivity factors for use in spark-source mass spectrometry
[DE86-700715] N86-29942
Safety fuels-specifications and progress N86-30018
Canadian forces approach to aircrew medical selection N86-30311
Cardiovascular standards for selection and retention of high performance pilots in the USAF: Perspectives for the next decade N86-30313
Entry visual standards and ocular examination techniques for future fighter aircrew N86-30317
Functions within the data communication layers of the ISO Open Systems Interconnection (OSI) model
[INF83/IPS/042] N86-30409
A formal description technique and the ISO transport layer --- Open Systems Interconnection
[INF83/IPS/007] N86-30410
STARS
Potentials of large format camera photography
[AD-A166079] N86-30126
STATE ESTIMATION
State estimation for Cox processes with unknown law: Parametric models
[AD-A166179] N86-30432
State estimation and parameter identification of linear and semilinear distributed parameter systems
[INPE-3904-PRE/945] N86-30455
State estimation and parameter identification for semilinear distributed parameter systems
[INPE-3932-PRE/964] N86-30456
STATE VECTORS
Optimal landing of a helicopter in autorotation
[NASA-CR-177082] N86-29809
STATIC LOADS
Fatigue test machine
[AD-D012232] N86-30133
STATIC TESTS
A literature review on the influence of small-amplitude cyclic loading on stress-corrosion cracking in alloys
[AD-A166403] N86-29967
STATISTICAL ANALYSIS
Atmospheric, climatic and environmental research
[NASA-CR-176880] N86-30287
On inference and transient response for M/G/1 models
[AD-A166578] N86-30458
STATISTICAL DECISION THEORY
Selecting the best population, a decision theoretic approach: The case of Pareto distribution
[AD-A166152] N86-30449
STATISTICAL DISTRIBUTIONS
On moderate and large deviations in multinomial distributions
[IR-242] N86-30442
Selecting the best population, a decision theoretic approach: The case of Pareto distribution
[AD-A166152] N86-30449
STATISTICAL TESTS
An improved test for the equality of coefficients of variation
[THE-RC-54335B] N86-30396
Confidence regions for variance components in unbalanced mixed linear models
[AD-A165841] N86-30428
On moderate and large deviations in multinomial distributions
[IR-242] N86-30442
The number of classes in chi-square goodness of fit tests
[IR-246] N86-30451
STATORS
Rotor-to-stator rub vibration in centrifugal compressor N86-30178
Partial rotor-to-stator rub demonstration N86-30197
STEAM
Pressure drop in flashing flow through obstructions
[DE86-007152] N86-30113
STEEL STRUCTURES
Use of miniaturized tests to predict flow properties and estimate fracture toughness in deformed steel plates
[DE86-007644] N86-29981
STEELS
Properties of spring steels hardened in polymer-bearing medium
[BLL-M-36734-(5828.4)] N86-29952
Process of structure formation of sintered steel KhSVZM
[BLL-M-36781-(5828.4)] N86-29957
Cryogenic mechanical properties of high-manganese steel weldments
[DE86-005219] N86-30212
Cutting of metal components by intergranular cracking
[DE86-006949] N86-30213
STEERABLE ANTENNAS
Random beam positioning surveillance process
[AD-D012251] N86-30053
STEERING
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] N86-30233
STELLAR EVOLUTION
Evolution of primordial gas clouds
[NASA-CR-176959] N86-30611
STELLAR LUMINOSITY
A study of (OI) 63.2 and 145.5 micron emission from M17 and SGR A from the Lear jet
[NASA-CR-177015] N86-30625
STELLAR MASS
Evolution of primordial gas clouds
[NASA-CR-176959] N86-30611
STELLAR RADIATION
Nonlinear temporal modulation of pulsar radioemission
[DE86-700670] N86-30626

STEREOPHOTOGRAPHY
Implementation of map-to-image-correspondence for synthetic aperture radar image analysis
[AD-A166791] N86-30246
STERILIZATION
Bacterial inactivation by means of ionizing radiation
[DE86-901038] N86-30348
STIFFENING
Near-field testing of the 15-meter model of the hoop column antenna. Volume 2: Near- and far-field plots for the LaRC feeds
[NASA-CR-178060] N86-29877
STIFFNESS
Measurement of rotor system dynamic stiffness by perturbation testing N86-30164
Identification of bearing and seal dynamic stiffness parameters N86-30184
Rotor/bearing system dynamic stiffness measurements N86-30201
Shaft mode shape demonstration N86-30202
STIRLING CYCLE
New and future heat pump technologies
[DE86-007866] N86-30117
Development of Stirling engine in FY 1984
[DE86-900207] N86-30217
Background review on compressors for gas engine-driven heat pumps
[PB86-201175] N86-30220
Automotive Stirling engine development program
[NASA-CR-175045] N86-30579
STOCHASTIC PROCESSES
Asymptotic methods for the analysis, estimation and control of stochastic dynamic systems
[AD-A166234] N86-30434
STORAGE BATTERIES
First International Workshop on Battery Testing, 30 September-2 October 1985, Heidelberg, FRG
[DE86-004058] N86-30080
STORMS
Anomalous US weather patterns accompanying stratospheric sudden warming
[AD-A166371] N86-30290
STOWAGE (ONBOARD EQUIPMENT)
Study of onboard expert systems to augment space shuttle and space station autonomy
[NASA-CR-176958] N86-29886
STRAIN RATE
Mechanical properties of multi-year sea ice. Phase 2: Test results
[AD-A166333] N86-30299
Point defects and high-temperature deformation of NiO
[DE86-005560] N86-30534
STRAPDOWN INERTIAL GUIDANCE
Technology research for strapdown inertial experiment and digital flight control and guidance
[NASA-CR-176907] N86-29800
STRATA
Perturbations of the Richardson number field by gravity waves
[NASA-CR-176910] N86-30273
STRATEGY
A program manager's guide on multiyear procurement
[AD-A166463] N86-30566
STRATIFICATION
Nonlinear effects in long range underwater acoustic propagation
[AD-A166492] N86-30472
STRATOSPHERE
Turbulent heating and transfer in the stratosphere and lower mesosphere
[AD-A166591] N86-30276
Anomalous US weather patterns accompanying stratospheric sudden warming
[AD-A166371] N86-30290
Stratospheric dust collections: Valuable resources for space and atmospheric scientists N86-30596
Targeted flight opportunities with large area collectors N86-30597
STRESS (PHYSIOLOGY)
Human vascular fluid responses to cold stress are not altered by cold acclimation
[AD-A165869] N86-30305
An environmentally-controlled extended-use small animal hypobaric chamber
[AD-A166729] N86-30307
Effects of 60 Hz electric fields on operant and social stress behaviors of nonhuman primates
[DE86-005807] N86-30347
STRESS (PSYCHOLOGY)
Effects of 60 Hz electric fields on operant and social stress behaviors of nonhuman primates
[DE86-005807] N86-30347
STRESS ANALYSIS
Wave propagation measurements on two-dimensional lattice
[AD-A166207] N86-29891
Computational significance of the intermediate configuration and hyperelastic stress relations in finite deformation elastoplasticity
[DE86-006720] N86-30239
Role of interfaces in cavity formation
[DE86-004763] N86-30543
STRESS CONCENTRATION
Calculating the temperature and stresses when one side of a plate is heated with a constant flow of heat
[BLL-M-36723-(5828.4)] N86-30226
STRESS CORROSION
Mechanism of stress-corrosion cracking of Alloy X-750 in high purity water
[DE86-006361] N86-29969
STRESS CORROSION CRACKING
Inhibiting corrosion cracking: Crack tip chemistry and physics
[AD-A166317] N86-29966
A literature review on the influence of small-amplitude cyclic loading on stress-corrosion cracking in alloys
[AD-A166403] N86-29967
Microstructure, microchemistry, and microdeformation of Alloy 600 tubing
[DE86-007947] N86-29983
STRESS INTENSITY FACTORS
Role of interfaces in cavity formation
[DE86-004763] N86-30543
STRESS RELAXATION
Chemically cross-linked heat-shrinkable polyethylene tubes
[AD-A166745] N86-29997
STRESS-STRAIN RELATIONSHIPS
Investigation of surface strains in fir tree turbine blade attachments
[AD-A166330] N86-29821
A viscoelastic-damage simulation model for filament-wound pressure vessels
[AD-A166389] N86-30208
Evaluation of the numerical stability and sensitivity of material parameter variations for several unified constitutive models
[MM-4998-85-6-PT-1] N86-30230
A comparison of current models for nonlinear rate-dependent material behavior of crystalline solids N86-30232
STRESSES
Experiments and micromechanical models for creep-rupture in polymer matrix composites
[DE86-007980] N86-29916
STRIP TRANSMISSION LINES
Asymmetrical coupled coplanar-type transmission lines with anisotropic substrates N86-30038
Proceedings of the 1985 Antenna Applications Symposium, volume 1
[AD-A166754] N86-30048
STRONGLY COUPLED PLASMAS
One-component plasma model and large Z laboratory plasmas
[AD-A166606] N86-30506
STRUCTURAL ANALYSIS
Wave propagation measurements on two-dimensional lattice
[AD-A166207] N86-29891
Failure propagation in continuum models of LSS (Large Space Structures), part 1
[AD-A166208] N86-29892
Instability analysis procedure for 3-level multi-bearing rotor-foundation systems N86-30162
Extreme winds and tornadoes: An overview
[DE86-006162] N86-30294
STRUCTURAL DESIGN
Differences between Hermes, US shuttle highlighted N86-29883
Computations and turbulent flow modeling in support of helicopter rotor technology
[NASA-CR-177095] N86-30090
STRUCTURAL DESIGN CRITERIA
Turbine instabilities: Case histories N86-30166
Influence of design parameters on occurence of oil whirl N86-30171
Extreme winds and tornadoes: An overview
[DE86-006162] N86-30294
STRUCTURAL FAILURE
National Transportation Safety Board safety recommendation
[NTSB-4357/1] N86-29792
STRUCTURAL MEMBERS
A simple nonlinear joint model
[NASA-TM-87749] N86-30234
STRUCTURAL STABILITY
An investigation of empennage buffeting
[NASA-CR-176973] N86-29864
Use of miniaturized tests to predict flow properties and estimate fracture toughness in deformed steel plates
[DE86-007644] N86-29981
STRUCTURAL VIBRATION
CO2 compressor vibration and cause analysis N86-30170
Data presentation techniques for rotating machinery malfunction diagnosis N86-30204
SUBGROUPS
On the isomorphism between gauge groups before and after renormalization in the presence of Abel subgroups and Higgs fields
[AD-A166276] N86-30435
SUBMARINES
Calcium and vitamin D metabolism in submariners: Carbon dioxide, sunlight and absorption considerations
[AD-A166292] N86-30306
SUBMERGING
Industrial inspection of grain size of precision tubes after heat treatment
[BLL-M-36744-(5828.4)] N86-30222
SUBMILLIMETER WAVES
An investigation of discharge structures in the submillimeter band in an MHD generator
[VDF-NT-84-16] N86-30516
SUBSONIC FLUTTER
Active flutter suppression on a delta wing model structure
[DFVLR-FB-86-01] N86-29870
SUBSTRATES
Asymmetrical coupled coplanar-type transmission lines with anisotropic substrates N86-30038
Investigation of basic characteristics of laser heating in thermoluminescence and of laser-stimulated luminescence
[AD-A166089] N86-30138
Rapid thermal processing of ion implanted silicon as a viable solar cell technology
[DE86-008216] N86-30259
SUBSTRUCTURES
On substructuring algorithms and solution techniques for the numerical approximation of partial differential equations
[NASA-CR-178122] N86-30425
SUCTION
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] N86-29815
SULFIDES
Directed synthesis/fabrication and surface modification of IR window materials for the 8-14 micron region
[AD-A166661] N86-30497
SULFUR DIOXIDES
Data collection and analysis for HCl, SO2, and NO2 immission-emission differential absorption lidars
[GKSS-85/E/53] N86-30268
SUMMER
United States Air Force Summer Faculty Research Program, 1985 technical report, volume 1
[AD-A166176] N86-30562
SUN
Some navigation and almanac algorithms
[AD-A165840] N86-29803
SUNLIGHT
Calcium and vitamin D metabolism in submariners: Carbon dioxide, sunlight and absorption considerations
[AD-A166292] N86-30306
SUPERCOMPUTERS
Proceedings of the 1984 CERN School of Computing
[DE86-700783] N86-30355
Energy Sciences Advanced Computation program plan
[DE86-006958] N86-30391
SUPERCONDUCTIVITY
A superconducting tunnel junction receiver for millimeter-wave astronomy
[NASA-TM-87792] N86-30517
Superconducting electronic film structures
[AD-A166183] N86-30522
High accuracy heat capacity measurements through the lambda transition of helium with very high temperature resolution
[NASA-CR-177037] N86-30555
SUPERCONDUCTORS
Superconductivity of thin film intermetallic compounds
[AD-A166271] N86-30525
Flux pinning by grain boundaries in A15 superconductors
[DE86-006250] N86-30538
SUPERCRITICAL WINGS
Influence of the angle of attack and flutter on the lift of a supercritical wing. Comparison between theory and experiment
[ONERA-RT-24/3064-RY-044-R] N86-29786

SUPERFLUIDITY
High accuracy heat capacity measurements through the lambda transition of helium with very high temperature resolution
[NASA-CR-177037] N86-30555
SUPERHETERODYNE RECEIVERS
A superconducting tunnel junction receiver for millimeter-wave astronomy
[NASA-TM-87792] N86-30517
SUPERHIGH FREQUENCIES
High pressure electron resonance studies of electronic, magnetic and structural phase transitions
[DE85-016971] N86-30544
SUPERLATTICES
Production and properties of metallic superlattices
[DE86-003058] N86-29970
Light-induced excess conductivity and the role of argon in the deposition of doping-modulated amorphous silicon superlattices
[DE86-005812] N86-30535
SUPERSONIC AIRCRAFT
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-88265] N86-29813
SUPERSONIC SPEED
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] N86-29764
SUPERSONIC WIND TUNNELS
Boundary layer stability measurements over a flat plate at mach 3
[AD-A166188] N86-29778
SUPPORTS
Repeatability study of a 6-axis robot
[DE86-006417] N86-30210
SUPPRESSORS
A comparison of methods for adaptive jamming suppression
[REPT-8-85] N86-30033
SURFACE ACOUSTIC WAVE DEVICES
A study of group-type single-phase unidirectional SAW transducers on LiNbO3 and quartz --- bandpass filters
[AD-A165670] N86-30067
Investigation of fast reaction SAW (Surface Acoustic Wave) accelerometer
[AD-A166779] N86-30131
SURFACE LAYERS
Proceedings of the Second Workshop on Ion Mixing and Surface Layer Alloying
[DE86-006159] N86-30547
SURFACE PROPERTIES
Dependence of bond strength of layers on energy state of contact surfaces during cladding of bimetals
[BLL-M-36769-(5828.4)] N86-29955
Relation between microstructural heterogeneous surface layer and nitrogen pressure during sintering in Si3N4-Al2O3 ceramics
[NASA-TM-88409] N86-29988
Calculating the temperature and stresses when one side of a plate is heated with a constant flow of heat
[BLL-M-36723-(5828.4)] N86-30226
Stability of surface nucleation
[NASA-TM-88806] N86-30556
SURFACE REACTIONS
Studies of metal/carbon surface chemistry, September 1, 1985-November 30, 1985
[DE86-007419] N86-29915
On the extension of the MCSCF/CI method
[NASA-CR-176933] N86-29924
The nature of chemisorbed oxygen on Ni(100) and Cu(100) N86-29925
A final report on the extension of the MCSCF/CI method N86-29926
Charging and hybridization in the finite cluster model N86-29927
Plasma nitriding of metallic surfaces
[LP-211] N86-29984
A multiple Gaussian wave packet theory of H2 diffraction and rotational excitation by collision with solid surfaces
[AD-A166291] N86-30529
Elastic and inelastic surface effects on ion penetration and the resulting sputtering and backscattering
[DE85-016604] N86-30545
SURFACE ROUGHNESS
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] N86-29801
Effects of surface roughness on heat transfer to gas turbine blades N86-29832
Thermal smoothing of rough surfaces in vacuo
[NASA-TM-88425] N86-29961
Numerical simulation of the flowfield over ice accretion shapes
[NASA-CR-176960] N86-30093
SURFACE TEMPERATURE
Prediction of transient temperatures for an air-cooled rotating disc N86-29842
The measurement of local heat transfer coefficients in blade cooling geometries N86-29848
An optical pyrometer to measure turbine blade surface temperature N86-29849
High frequency response heat flux gauge for metal blading N86-29850
Thermal sensing of cryogenic wind tunnel model surfaces
[NASA-CR-178136] N86-30098
SURFACTANTS
Crystalline surfactant dispersions by radio frequency absorption
[DE86-000267] N86-30551
SURGES
Transient heat conduction in semi-infinite solids with temperature dependent properties
[AD-A166613] N86-30105
SURVEILLANCE
Random beam positioning surveillance process
[AD-D012251] N86-30053
SURVIVAL
Application of systems analysis techniques to vulnerability studies of complex installations
[DE86-006012] N86-30223
Selecting the best population, a decision theoretic approach: The case of Pareto distribution
[AD-A166152] N86-30449
SWINE
Biological studies of swine exposed to 60-Hz electric fields. Volume 5: Hematology and serum chemistry
[DE86-005362] N86-30344
SWIRLING
Demonstration of various rotor instabilities (exhibit of Bently Rotor Dynamics Research Corporation Laborator rigs at symposium on instability in rotaing machinery) N86-30194
Anti-swirling demonstration N86-30196
SWITCHES
Double-injection, deep-impurity switch development
[NASA-CR-174936] N86-30073
Fiber optic rotary switching device
[AD-D012231] N86-30499
SWITCHING CIRCUITS
Organization of the channel-switching process in parallel computer systems based on a matrix optical switch
[NASA-TM-88452] N86-30406
SYMBOLIC PROGRAMMING
Report on the AI trip
[IR-82] N86-30397
SYMMETRY
Field calculations of axisymmetric current coils in vacuum
[ESA-86-97547] N86-30058
On substructuring algorithms and solution techniques for the numerical approximation of partial differential equations
[NASA-CR-178122] N86-30425
SYNCHRONISM
Experience with synchronous and asynchronous digital control systems
[NASA-TM-88271] N86-29866
SYNTHESIS (CHEMISTRY)
Phenylquinoxaline resin compositions
[AD-D012230] N86-29912
Simultaneous combustion synthesis and densification of refractory materials
[DE86-006528] N86-29939
Combustion synthesis of Si3N4 and AlN
[DE86-006530] N86-29940
Chemistry of new silicon containing polymers triply bonded silicon intermediates
[AD-A166085] N86-29990
Phenylquinoxaline resin monomers
[AD-D012236] N86-29998
Synthesis of model polymers and related structures in support of vinyl monomer grafting studies
[DE86-008204] N86-30006
SYNTHETIC APERTURE RADAR
VARAN-S: An airborne synthetic aperture radar for research in microwave remote sensing
[CNES-CT/DRT/TIT/RL-93-T] N86-30036
Implementation of map-to-image-correspondence for synthetic aperture radar image analysis
[AD-A166791] N86-30246
SYSTEM FAILURES
Data presentation techniques for rotating machinery malfunction diagnosis N86-30204
SYSTEM IDENTIFICATION
Input signal design for system identification; a comparative analysis
[ER-84/06] N86-30402
Application of input signal design in system identification for adaptive control
[ER-84/04] N86-30414
Identification of multivariable systems and representation in canonical and pseudo-canonical form
[ESA-86-97520] N86-30446
SYSTEMS ANALYSIS
Experience with synchronous and asynchronous digital control systems
[NASA-TM-88271] N86-29866
Development of composite tube protective coatings
[NASA-CR-178116] N86-29989
Application of systems analysis techniques to vulnerability studies of complex installations
[DE86-006012] N86-30223
Asymptotic methods for the analysis, estimation and control of stochastic dynamic systems
[AD-A166234] N86-30434
SYSTEMS ENGINEERING
TOFACS (Technical Office Automation and Communication System) software development and enhancements for fiscal year 1983 - fiscal year 1985
[AD-A166563] N86-30352
The role of databases in knowledge-based systems
[AD-A166365] N86-30573

T

TACHYONS
Considerations about the apparent superluminal expansions in astrophysics
[DE86-701328] N86-30613
TAIL ASSEMBLIES
An investigation of empennage buffeting
[NASA-CR-176973] N86-29864
TANKS (COMBAT VEHICLES)
US Army Fire Resistant Fuel (FRF) program presentation to FAA Aviation Fuel Safety Meeting N86-30014
TANKS (CONTAINERS)
Quality assurance for water sampling
[AD-A165842] N86-30263
TARGET ACQUISITION
Space infrared telescope pointing control system. Automated star pattern recognition
[NASA-CR-176911] N86-30608
TARGET RECOGNITION
The effect of background luminance and ambient illumination on color discrimination in a CRT display
[AD-A166297] N86-30496
TARGETS
Observations of mass transport phenomena in multicomponent liquid mixtures
[DE86-006483] N86-30110
The effects of color-coding in GEOSIT (geographical situational) displays. 2: Redundant versus non-redundant color-coding
[AD-A166263] N86-30334
Hypervelocity particle capture: Some considerations regarding suitable target media N86-30592
TASKS
Visual capabilities related to fighter aircrew performance in the F-14 and adversary aircraft N86-30320
An investigation of the use of steady-state evoked potentials for human performance and workload assessment and control
[AD-A166205] N86-30332
TAYLOR SERIES
Approximations of nonlinear systems having outputs
[NASA-CR-176946] N86-30417
TEA LASERS
NASA Lidar system support and MOPA technology demonstration
[NASA-CR-178144] N86-30136
TECHNOLOGY ASSESSMENT
Powder metallurgy: Achievements, details and plans
[BLL-M-36780-(5828.4)] N86-29956
Report on the AI trip
[IR-82] N86-30397
TECHNOLOGY TRANSFER
Worldwide report: Telecommunications policy, research, and development
[JPRS-TTP-86-013] N86-29897
Issues in LSI automation, protocol standardization N86-30087
Technology transfer and artificial intelligence
[AD-A166035] N86-30581
Transfer of high-technology to the Soviet Union. A predicament for the US
[AD-A166469] N86-30582
TECHNOLOGY UTILIZATION
Powder metallurgy: Achievements, details and plans
[BLL-M-36780-(5828.4)] N86-29956
Data transmission by radar --- jamming resistance
[REPT-8-85] N86-30032

Structures and Dynamics Division research and technology plans for FY 1986 and accomplishments for FY 1985
[NASA-TM-87742] N86-30235
Remote measurement of tropospheric parameters by lidar --- pollution monitoring
[GKSS-85/E/50] N86-30283
Varied line-space gratings: past, present and future
[DE86-007498] N86-30503

TELECOMMUNICATION
Worldwide report: Telecommunications policy, research, and development
[JPRS-TTP-86-013] N86-29897
Stable compensation of nonlinear communications systems (using Volterra systems characterization), volume 2
[AD-A165836] N86-30041
TOFACS (Technical Office Automation and Communication System) software development and enhancements for fiscal year 1983 - fiscal year 1985
[AD-A166563] N86-30352

TELEOPERATORS
Human factors activities in teleoperator development at the Oak Ridge National Laboratory
[DE86-005160] N86-30340

TELEPHONES
Worldwide report: Telecommunications policy, research and development
[JPRS-TTP-86-011] N86-30064
Development of China's fiber optic technology discussed N86-30066

TELEVISION TRANSMISSION
Satellites said to function well, plans revealed N86-29898
China's satellite communications discussed N86-30065

TEMPERATURE DEPENDENCE
In situ high voltage electron microscope studies of ion- and electron-beam induced modification of materials
[DE86-005577] N86-30491

TEMPERATURE DISTRIBUTION
Prediction of transient temperatures for an air-cooled rotating disc N86-29842
Measurements of fluctuating gas temperatures using compensated fine wire thermocouples N86-29852
Transient thermal behaviour of a compressor rotor with ventilation: Test results under simulated engine conditions N86-29856
A comprehensive analysis algorithm for ablation, temperature fields and thermal stresses of the carbon-base nosetips
[AD-A166615] N86-29896
Transient heat conduction in semi-infinite solids with temperature dependent properties
[AD-A166613] N86-30105
Calculating the temperature and stresses when one side of a plate is heated with a constant flow of heat
[BLL-M-36723-(5826.4)] N86-30226
The stability of low-latitude sea-surface temperatures: An evaluation of the CLIMAP reconstruction with emphasis on the positive SST anomalies
[DE85-016190] N86-30300

TEMPERATURE EFFECTS
Material properties of epoxy resins reinforced with carbon fibers, affected by heat radiation
[FOA-C-20597-F9] N86-29917
Aging of carbon-epoxy composite in humid environments
[PV-42-791/F] N86-29921
Thermal smoothing of rough surfaces in vacuo
[NASA-TM-88425] N86-29961
Influence of conditions on the performance of small heat pumps
[DE86-751178] N86-30115
Integrated research in constitutive modelling at elevated temperatures, part 1
[NASA-CR-177237] N86-30227
Integrated research in constitutive modelling at elevated temperatures: Summary of the project N86-30228
On the use of internal state variables in thermoviscoplastic constitutive equations N86-30231

TEMPERATURE GRADIENTS
Effect of interfacial phenomena on contact line heat transfer, 1
[AD-A166088] N86-30557

TEMPERATURE MEASUREMENT
Heat-flux measurements and analysis for a rotating turbine stage N86-29838
The measurement of local heat transfer coefficients in blade cooling geometries N86-29848
An optical pyrometer to measure turbine blade surface temperature N86-29849
High frequency response heat flux gauge for metal blading N86-29850
Measurements of fluctuating gas temperatures using compensated fine wire thermocouples N86-29852
Optical diagnostics of gas-dynamic flows using advanced laser measurement techniques
[NASA-CR-176950] N86-30095
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129
High accuracy heat capacity measurements through the lambda transition of helium with very high temperature resolution
[NASA-CR-177037] N86-30555

TEMPERATURE MEASURING INSTRUMENTS
The isentropic light piston annular cascade facility at RAE Pyestock N86-29851

TEMPERATURE PROBES
An optical pyrometer to measure turbine blade surface temperature N86-29849

TEMPERATURE RATIO
Daytime and nighttime neutral wind and temperature measurements from incoherent scatter radar at 300 KM over Arecibo
[AD-A166600] N86-30292

TEMPERATURE SENSORS
High frequency response heat flux gauge for metal blading N86-29850

TENSILE PROPERTIES
Use of miniaturized tests to predict flow properties and estimate fracture toughness in deformed steel plates
[DE86-007644] N86-29981

TENSILE STRENGTH
The influence of chemical structure on the strength of rubber
[AD-A165355] N86-29993

TERRAIN
Implementation of map-to-image-correspondence for synthetic aperture radar image analysis
[AD-A166791] N86-30246

TERRESTRIAL PLANETS
Volatile components and continental material of planets
[NASA-TM-86478] N86-30615

TEST CHAMBERS
Hypobaric training of flight personnel without compromising quality of life N86-30327

TEST FACILITIES
Combustion in IC engines
[DE86-007846] N86-29947
Preliminary instrumentation for aeroelastic tests at the compressor level --- turbocompressor test bench
[ONERA-RT-95/7108-RY-054-R] N86-30219
Sensor driven robot systems testbed
[DE86-005892] N86-30412

TETHERED SATELLITES
The use of tethered satellites for the collection of cosmic dust and the sampling of man made orbital debris far from the space station N86-30589

THEOREMS
Control of nonlinear systems using fixed point theorems
[INPE-3923-PRE/957] N86-30454

THERMAL ANALYSIS
Bearing tester data compilation analysis, and reporting and bearing math modeling
[NASA-CR-176690] N86-30205

THERMAL ENVIRONMENTS
A comprehensive analysis algorithm for ablation, temperature fields and thermal stresses of the carbon-base nosetips
[AD-A166615] N86-29896

THERMAL EXPANSION
Chalcogenide glasses. Part 2: Optical thickness temperature relation in chalcogenide glass films
[AD-A166589] N86-29995

THERMAL INSULATION
Dynamics insulation systems
[NASA-CR-177026] N86-30554

THERMAL PROTECTION
Cooling techniques for turbojet pre-heater channels N86-29847

THERMAL RADIATION
Material properties of epoxy resins reinforced with carbon fibers, affected by heat radiation
[FOA-C-20597-F9] N86-29917

THERMAL STRESSES
A comprehensive analysis algorithm for ablation, temperature fields and thermal stresses of the carbon-base nosetips
[AD-A166615] N86-29896
Effects of thermal and cyclic loads on silicon carbide yarn reinforced glass matrix composites
[DE86-006793] N86-29913
Infrared monitoring of gyrotron windows
[DE86-002449] N86-30134

THERMISTORS
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129

THERMOCHEMICAL PROPERTIES
Thermochemical modeling of ceramic systems formed by combustion
[DE86-007370] N86-30004

THERMOCHROMATIC MATERIALS
The measurement of local heat transfer coefficients in blade cooling geometries N86-29848

THERMOCOUPLES
Measurements of fluctuating gas temperatures using compensated fine wire thermocouples N86-29852

THERMODYNAMIC PROPERTIES
Radiative augmented combustion
[AD-A166185] N86-29932
Dynamics insulation systems
[NASA-CR-177026] N86-30554

THERMODYNAMICS
Thermal smoothing of rough surfaces in vacuo
[NASA-TM-88425] N86-29961
Nucleation of allotropic phases during pulsed laser annealing of manganese
[DE86-004584] N86-29973
Two-phase flows within systems with ambient pressure N86-30167
Integrated research in constitutive modelling at elevated temperatures, part 1
[NASA-CR-177237] N86-30227
Integrated research in constitutive modelling at elevated temperatures: Summary of the project N86-30228
Failure analysis and microcrack dependent discontinuum mechanics
[DE86-006710] N86-30240
Thermal ion heating in the vicinity of the plasmapause: A Dynamics Explorer guest investigation
[NASA-CR-176993] N86-30272
High accuracy heat capacity measurements through the lambda transition of helium with very high temperature resolution
[NASA-CR-177037] N86-30555
Astrophysical materials science: Theory
[NASA-CR-177021] N86-30610

THERMOREGULATION
Thermoregulation after atropine and pralidoxime administration
[AD-A165868] N86-30304

THERMOSETTING RESINS
Phenylquinoxaline resin compositions
[AD-D012230] N86-29912
Phenylquinoxaline resin monomers
[AD-D012236] N86-29998

THESAURI
NASA thesaurus supplement
[NASA-SP-7053-SUPP-1] N86-30569
Artificial intelligence indexing: Creating knowledge bases of index terms ordered by semantic relations
[AD-A166766] N86-30574

THICKNESS
Chalcogenide glasses. Part 2: Optical thickness temperature relation in chalcogenide glass films
[AD-A166589] N86-29995

THIN FILMS
Detection of chemical vapor mixtures by sorption on multiple piezoelectric crystals
[DE86-006699] N86-29941
Hydrodynamics and heat transfer in a liquid film under the end of a rotating cylinder
[BLL-M-36755-(5826.4)] N86-30086
Feasibility study of a discrete bearing/roller drive rotary joint for the space station
[NASA-TM-88800] N86-30206
Research on high-efficiency, single-junction, monolithic, thin-film amorphous silicon solar cells
[DE86-004420] N86-30258
Acta Optica Sinica (selected articles)
[AD-A166281] N86-30495
Directed synthesis/fabrication and surface modification of IR window materials for the 8-14 micron region
[AD-A166661] N86-30497
Semiconducting transition metal silicides for electro-optic VSLI interconnects
[AD-A165895] N86-30519
Superconductivity of thin film intermetallic compounds
[AD-A166271] N86-30525
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166274] N86-30527
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166290] N86-30528
Contributions of electron microscopy to the understanding of reactions on compound semiconductor surfaces
[DE86-005230] N86-30533
Electrochemical photocapacitance spectroscopy of amorphous silicon alloy materials
[DE86-004421] N86-30546

Stability of surface nucleation
[NASA-TM-88806] N86-30556

THORIUM OXIDES
Review of fracture properties of nuclear materials determined by Hertzian indentation
[DE86-005520] N86-30238

THREE AXIS STABILIZATION
A self-tuning regulator based on pole placement design for use in satellite attitude control
[INPE-3861-PRE/924] N86-29587

THREE DIMENSIONAL BODIES
Preliminary development of a global 3-D magnetohydrodynamic computational model for solar wind-cometary and planetary interactions
[NASA-CR-177090] N86-30621

THREE DIMENSIONAL BOUNDARY LAYER
Incipient transition phenomena in compressible flows over a flat plate
[NASA-CR-178111] N86-30097

THREE DIMENSIONAL FLOW
Preliminary research on post-stall aerodynamics
[AD-A166279] N86-29780

THREE DIMENSIONAL MOTION
Rotor instability due to loose rotating part N86-30198

THRUST
Experimental and theoretical study of propeller spinner/shank interference
[NASA-CR-176954] N86-29773

THRUST AUGMENTATION
Experiments on high speed ejectors
[NASA-CR-177419] N86-29820

THRUST VECTOR CONTROL
Vectored thrust digital flight control for crew escape, volume 1
[AD-A166580] N86-29798
Vectored thrust digital flight control for crew escape, volume 2
[AD-A166596] N86-29799

THUNDERSTORMS
Factors leading to the formation of arc cloud complexes
[AD-A166501] N86-30291

TILT ROTOR RESEARCH AIRCRAFT PROGRAM
An experimental and analytical method for approximate determination of the tilt rotor research aircraft rotor/wing download
[NASA-CR-176970] N86-29769

TILTING ROTORS
An experimental and analytical method for approximate determination of the tilt rotor research aircraft rotor/wing download
[NASA-CR-176970] N86-29769

TIME DEPENDENCE
Pseudo-time algorithms for the Navier-Stokes equations
[NASA-CR-178127] N86-29776
Experiments and micromechanical models for creep-rupture in polymer matrix composites
[DE86-007980] N86-29916
Time dependent variational description of one-dimensional inelastic scattering
[DE86-700610] N86-30055
Incipient transition phenomena in compressible flows over a flat plate
[NASA-CR-178111] N86-30097
AGgaussian wave packet method for studying time dependent quantum mechanics in a curve crossing system: Low energy motion, tunneling and thermal dissipation
[AD-A166262] N86-30558
Nonlinear temporal modulation of pulsar radioemission
[DE86-700670] N86-30626

TIME LAG
Adaptive control of first-order systems with time-delay
[ER-84/05] N86-30415

TIME SERIES ANALYSIS
Numerical considerations in the development and implementation of constitutive models N86-30229
Walsh-Fourier analysis of discrete-valued time series
[AD-A166139] N86-30430

TIN ALLOYS
Flux pinning by grain boundaries in A15 superconductors
[DE86-006250] N86-30538

TIP VANES
Simplified examinations of the aerodynamic performances of tip vane rotors
[NLR-M-AT-84-007-L] N86-29787
Estimate of the aerodynamic performances of tip vane rotors using the Helix program
[NLR-TR-85027-L] N86-29788
Aerodynamic research on tip vane rotors, carried out by NLR, and a rough evaluation of the tip vane concept
[NLR-TR-85064-L] N86-29789

TITANIUM
Non-metallic inclusions in cast low-alloy steel with titanium additions
[BLL-M-36733-(5828.4)] N86-29951

TITANIUM ALLOYS
Theory of amorphization kinetics in intermetallics
[DE86-004858] N86-29974

TOKAMAK DEVICES
Generalized banana-drift transport
[DE86-002535] N86-30509
Resistive instabilities in tokamaks
[DE86-002536] N86-30510
Study of surfaces and surface layers on high temperature materials after short-time thermal loads --- tokamaks
[JUEL-2024] N86-30514
Enhanced small scale turbulence oscillations correlated to sawtooth relaxations in the TEXTOR tokamak
[JUEL-2025] N86-30515

TOLERANCES (PHYSIOLOGY)
Halon extinguisher agent behavior in a ventilated small aircraft
[DOT/FAA/CT-86/5] N86-29794
Human vascular fluid responses to cold stress are not altered by cold acclimation
[AD-A165869] N86-30305
An environmentally-controlled extended-use small animal hypobaric chamber
[AD-A166729] N86-30307

TOPOGRAPHY
A procedure for evaluation of dust potential in desert terrains
[AD-A166491] N86-30245

TOPOLOGY
Graph theory in the study of metal cluster bonding topology: Applications to metal clusters having fused polyhedra
[AD-A166623] N86-29937
Closed images of topological groups
[IR-243] N86-30453
Chebyshev sets and continuous position
[IR-245] N86-30454

TOROIDAL PLASMAS
Generalized banana-drift transport
[DE86-002535] N86-30509

TORQUE
Experimental and theoretical study of propeller spinner/shank interference
[NASA-CR-176954] N86-29773
Experimental verification and practical application of torquewhirl theory of rotordynamic instability N86-30169

TOUGHNESS
Use of miniaturized tests to predict flow properties and estimate fracture toughness in deformed steel plates
[DE86-007644] N86-29981

TRACKING (POSITION)
Computer analysis of visual and vestibular oculomotor function in the medical selection of fighter aircrew members N86-30319
The output of linear systems to quasipolynomial inputs
[AD-A166740] N86-30437
Use of a virtual control approach in state estimation
[INPE-3903-PRE/944] N86-30453

TRACKING RADAR
A radar data processing and enhancement system
[NASA-TM-88274] N86-29884

TRAFFIC
Round robin scheduling for fair flow control in data communication networks
[AD-A166728] N86-30047

TRAILING EDGES
Motion and interaction of decaying trailing vortices in spanwise shear wind
[NASA-TP-2599] N86-29762
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-88265] N86-29813
Local and mean heat transfer on the leading and trailing surfaces of a square-sectioned duct rotating in the orthogonal-mode N86-29826

TRAINING EVALUATION
Physical training of Mirage 2000 pilots N86-30324
The computer-aided analytic process model. Operations handbook for the analytic process model demonstration package
[AD-A166180] N86-30381

TRAJECTORIES
Mean trajectory gaussian wave packet approach to rotationally inelastic molecule-surface diffraction
[AD-A166275] N86-30478

TRAJECTORY ANALYSIS
Trajectory determinations and collection of micrometeoroids on the space station. Report of the Workshop on Micrometeorite Capture Experiments
[NASA-CR-177303] N86-30584
Interplanetary dust: The interstellar connection N86-30587
Prospects for an orbital determination and capture cell experiment N86-30588
Acoustic penetration and impact detector for micrometeoroid and space debris application N86-30594
Precision requirements on cosmic dust trajectory measurements N86-30607

TRAJECTORY MEASUREMENT
A radar data processing and enhancement system
[NASA-TM-88274] N86-29884

TRANSDUCERS
Analogue signal conditioning for flight test instrumentation
[AGARD-AG-160-VOL-17] N86-29816

TRANSFER FUNCTIONS
Stable compensation of nonlinear communications systems (using Volterra systems characterization), volume 2
[AD-A165838] N86-30041
Eigenvalues and stability problems of rotors N86-30192
Computational efficiency study of a semi-analytical technique for the angular integral estimation found in transfer matrix generation
[DE86-700784] N86-30462

TRANSIENT RESPONSE
On inference and transient response for M/G/1 models
[AD-A166578] N86-30458

TRANSISTOR AMPLIFIERS
Monolithic low noise amplifier with limiting --- application to Global Positioning System receivers
[AD-D012225] N86-30076

TRANSISTOR CIRCUITS
Macromodeling and optimization of digital MOS VLSI circuits
[AD-A166658] N86-30075
Monolithic low noise amplifier with limiting --- application to Global Positioning System receivers
[AD-D012225] N86-30076

TRANSISTORS
Electrical characteristics and testing considerations for gate oxide shorts in CMOS ICs
[DE85-016168] N86-30542

TRANSITION METALS
On the extension of the MCSCF/CI method
[NASA-CR-176933] N86-29924
A final report on the extension of the MCSCF/CI method N86-29926
Theoretical research program to study transition metal trimers and embedded clusters
[NASA-CR-176948] N86-29960
Theory of electronic states in disordered alloy hydrides
[DE86-006260] N86-30539

TRANSLATING
Translation table for DOE/OSTI - COSATI bibliographic records to MARC format records
[DE86-006473] N86-30576

TRANSMISSION CIRCUITS
Data transmission systems circuits and exchange parameters on the C3 interface in the case of the parallel input-output of discrete information
[AD-A166206] N86-30044

TRANSMISSION LINES
Transmission line design for a power distribution system at 20 kHz for aircraft
[NASA-CR-3987] N86-29818

TRANSMITTANCE
Experimental study of electronic states at metal-dielectric interfaces
[AD-A166274] N86-30527

TRANSONIC FLOW
Transonic Navier-Stokes wing solution using a zonal approach. Part 1: Solution methodology and code validation
[NASA-TM-88248] N86-29765
Improvements in code TUNCOR for calculating wall interference corrections in the transonic regime
[AD-A166766] N86-29783
Influence of the angle of attack and flutter on the lift of a supercritical wing. Comparison between theory and experiment
[ONERA-RT-24/3064-RY-044-R] N86-29786

TRANSONIC WIND TUNNELS
Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-176902] N86-29771
Effect of Reynolds Number and Mach Number on flow angularity probe sensitivity
[NASA-TM-87750] N86-29774

Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] N86-29815
Cryogenic wind tunnels for high Reynolds number testing
[NASA-TM-87743] N86-29872

TRANSPORT AIRCRAFT
Task Force report on emergency evacuation of transport airplanes, volume 1
[DOT/FAA/VS-86/1.1] N86-29793
Task force report on emergency evacuation of transport airplanes. Volume 2: Supporting documentation
[FAA/VS-86/1,2] N86-29797

TRANSPORT PROPERTIES
Transport coefficients for carbon, hydrogen, and the organic mixture C2H3
[DE86-008323] N86-[illegible]049
Continental shelf processes affecting the oceanography of the South Atlantic Bight
[DE86-008212] N86-30301
Generalized banana-drift transport
[DE86-002535] N86-30509
Elastic and inelastic surface effects on ion penetration and the resulting sputtering and backscattering
[DE85-016604] N86-30545
Astrophysical materials science: Theory
[NASA-CR-177021] N86-30610

TRANSVERSE ACCELERATION
Convective heat transfer from circular cylinders located within perforated cylindrical shrouds
[NASA-CR-4005] N86-30100

TRAVELING WAVE TUBES
Wide-band distributed RF coupler
[AD-D012214] N86-30049

TREES (MATHEMATICS)
The Steiner tree problem. Linear programming model and decomposition technique resolution
[ENST-85E010] N86-30394
A fast, tree-based access method --- file maintenance
[IR-85] N86-30439

TRIANGULATION
Potentials of large format camera photography
[AD-A166079] N86-30126

TRIMERS
Theoretical research program to study transition metal trimers and embedded clusters
[NASA-CR-176948] N86-29960

TRINITROTOLUENE
Comparison of extraction techniques and solvents for explosive residues in soil
[AD-A166474] N86-30026

TRITIUM
Technical issues and requirements of experiments and facilities for fusion nuclear technology. FINESSE phase 1, volume 2
[DE86-006503] N86-30511

TROPICAL REGIONS
Report on the phase A study of a joint Indonesian-Netherlands Tropical Earth Resources Satellite (TERS) program
[JTERS-84-10] N86-30249
The stability of low-latitude sea-surface temperatures: An evaluation of the CLIMAP reconstruction with emphasis on the positive SST anomalies
[DE85-016190] N86-30300

TROPOPAUSE
Internal wave motion
[NASA-CR-178871] N86-30275

TROPOSPHERE
Remote measurement of tropospheric parameters by lidar --- pollution monitoring
[GKSS-85/E/50] N86-30283
Anomalous US weather patterns accompanying stratospheric sudden warming
[AD-A166371] N86-30290

TRUSSES
A simple nonlinear joint model
[NASA-TM-87749] N86-30234

TUBE HEAT EXCHANGERS
Study of heat exchangers between a liquid loop feeder and a heat-pipe radiator --- spacecraft thermal control
[FOK-TR-R-84-108] N86-30089
Structural dynamics and fluid flow in shell-and-tube heat exchangers. Summary and overview of a DOE/ECUT-sponsored research program
[DE86-007798] N86-30114

TUNGSTEN
Ferroelectric tungsten bronze crystals for far infrared electro-optic device applications
[AD-A166484] N86-30531
Cosmic X-ray physics
[NASA-CR-177227] N86-30624

TURBINE BLADES
National Transportation Safety Board safety recommendation
[NTSB-4360/33] N86-29791
Investigation of surface strains in fir tree turbine blade attachments
[AD-A166330] N86-29821
Self-retained platform cooling plate for turbine vane
[AD-D012218] N86-29822
Heat Transfer and Cooling in Gas Turbines
[AGARD-CP-390] N86-29823
Cooling techniques for gas turbine airfoils: A survey N86-29824
Rotating heat transfer investigations on a multi-pass cooling geometry N86-29825
Local and mean heat transfer on the leading and trailing surfaces of a square-sectioned duct rotating in the orthogonal-mode N86-29826
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins N86-29827
External heat transfer study on a HP turbine rotor blade N86-29828
Effects of wakes on the heat transfer in gas turbine cascades N86-29829
Wake-passing in a turbine rotor cascade N86-29830
Effects of hole geometry, wall curvature and pressure gradient on film cooling downstream of a single row --- gas turbine cooling N86-29831
Effects of surface roughness on heat transfer to gas turbine blades N86-29832
Shroud segments for unshrouded blade turbines N86-29835
Engine tests on a cooled gas turbine stage N86-29836
Heat transfer test evaluation of the shell-spar blade cooling concept applied to industrial gas turbines N86-29837
Heat-flux measurements and analysis for a rotating turbine stage N86-29838
Calculation of laminar-turbulent boundary layer transition on turbine blades N86-29839
A model for correlating flat plate film cooling effectiveness for rows of round holes N86-29840
The measurement of local heat transfer coefficients in blade cooling geometries N86-29848
An optical pyrometer to measure turbine blade surface temperature N86-29849
High frequency response heat flux gauge for metal blading N86-29850
The isentropic light piston annular cascade facility at RAE Pyestock N86-29851
Influence and tip clearance measurement in turbomachines N86-29854
Effect of film cooling on the aerodynamic performance of a turbine cascade N86-29859
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades N86-29861
The boundary layer behaviour of an advanced gas turbine rotor blade under the influence of simulated film cooling N86-29862
Composite turbine blade design options for Claude (open) cycle OTEC power systems
[DE85-016876] N86-30215
Design and initial testing of a one-bladed 30-meter-diameter rotor on the NASA/DOE mod-O wind turbine
[NASA-TM-88810] N86-30251

TURBINE ENGINES
National Transportation Safety Board safety recommendation
[NTSB-4360/33] N86-29791

TURBINE PUMPS
Non-intrusive speed sensor
[NASA-CR-178873] N86-30125
Some new results concerning the dynamic behavior of annular turbulent seals N86-30174
Vertical reactor coolant pump instabilities N86-30182
Bearing tester data compilation analysis, and reporting and bearing math modeling
[NASA-CR-176909] N86-30205

TURBINE WHEELS
Topping turbine (103-JAT) rotor instability in 1150-STPD Kellogg ammonia plants N86-30188

TURBINES
Turbine instabilities: Case histories N86-30166
Two-phase flows within systems with ambient pressure N86-30167
Cracked rotor demonstration N86-30200

TURBOCOMPRESSORS
CO2 compressor vibration and cause analysis N86-30170
Oil seal effects and subsynchronous vibrations in high-speed compressors N86-30176
Topping turbine (103-JAT) rotor instability in 1150-STPD Kellogg ammonia plants N86-30188
Aerodynamic instability: A case history N86-30190
Data presentation techniques for rotating machinery malfunction diagnosis N86-30204
Preliminary instrumentation for aeroelastic tests at the compressor level --- turbocompressor test bench
[ONERA-RT-95/7108-RY-054-R] N86-30219

TURBOFAN ENGINES
HYTESS 2: A Hypothetical Turbofan Engine Simplified Simulation with multivariable control and sensor analytical redundancy
[NASA-TM-87344] N86-30068
Noise predictions of a high bypass turbofan engine using the Lockheed Near-Field Noise Prediction Program
[NASA-CR-178146] N86-30469

TURBOJET ENGINES
Self-retained platform cooling plate for turbine vane
[AD-D012218] N86-29822
Cooling techniques for turbojet pre-heater channels N86-29847
Ceramic heat exchangers for gas turbines or turbojet engines N86-29858

TURBOMACHINERY
Instability in Rotating Machinery
[NASA-CP-2409] N86-30180
Active magnetic bearings for optimum turbomachinery design N86-30186

TURBOSHAFTS
Multi-variable control of the GE T700 engine using the LQG/LTR design methodology
[NASA-CR-177080] N86-29819

TURBULENCE
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] N86-29782
Discussion of turbulent flame structure in premixed charges
[DE86-008174] N86-29948
CAVEAT: A computer code for fluid dynamics problems with large distortion and internal slip
[DE86-008570] N86-30120

TURBULENCE EFFECTS
External heat transfer study on a HP turbine rotor blade N86-29828
Effects of wakes on the heat transfer in gas turbine cascades N86-29829
Effects of surface roughness on heat transfer to gas turbine blades N86-29832
Some thoughts on the modeling of atmospheric turbulence from the perspective of a non-expert
[DE86-006498] N86-30261

TURBULENT BOUNDARY LAYER
Calculation of laminar-turbulent boundary layer transition on turbine blades N86-29839

TURBULENT FLOW
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] N86-29772
Computation of thermal radiation for gas turbine conditions N86-29841
Heat transfer in gas turbine combustors: A discussion of mathematical modeling of combustion, heat and mass transfer with emphasis on heat transfer in gas turbine combustors N86-29843
Two spot laser velocimeter measurements of velocity and turbulence intensity in shock tube driven turbine flows N86-29853
Simulation of flow and heat transfer in annular cavities between disks in turbomachinery N86-29855
Application of rayleigh scattering to turbulent flow with heat transfer and combustion
[AD-A166223] N86-29933
Optical diagnostics of gas-dynamic flows using advanced laser measurement techniques
[NASA-CR-176950] N86-30095
International Workshop on Two-Phase Flow Fundamentals
[DE86-006548] N86-30112
Spectral study of turbulence. Pure rotation and introduction to mode composition
[ESA-86-97273] N86-30121
Models and prediction of turbulent flow with suspended particles
[ONERA-RT-22/7135-EY] N86-30122
Models and prediction of turbulent flow with suspended particles. Report on the work done by Rouen University in 1984-85
[ONERA-RT-23/7135-EY] N86-30123

TURBULENT HEAT TRANSFER
Turbulent heating and transfer in the stratosphere and lower mesosphere
[AD-A166591] N86-30276

TURBULENT MIXING
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] N86-29782

TURBULENT WAKES
Analytical investigation of rotor wake formation and geometry
[NASA-CR-177032] N86-29768
TURNING FLIGHT
The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways
[AD-A166485] N86-29804
TWO DIMENSIONAL FLOW
Stability and control of compressible flows over a surface with concave-convex curvature
[NASA-CR-178143] N86-29775
Preliminary research on post-stall aerodynamics
[AD-A166279] N86-29780
TWO DIMENSIONAL JETS
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] N86-29782
TWO PHASE FLOW
Theoretical and experimental investigation of flamespreading processes in combustible-cased, stick propellant charges
[AD-A166461] N86-30025
International Workshop on Two-Phase Flow Fundamentals
[DE86-006548] N86-30112
Two-phase flows within systems with ambient pressure N86-30167

U

U.S.S.R. SPACE PROGRAM
An overview of the Kaliningrad Spaceflight Control Center
[NASA-TM-87980] N86-29876
ULTRAHIGH VACUUM
Outgassing measurement of the aluminum alloy UHV chamber
[NASA-TM-88433] N86-29962
ULTRASONIC TESTS
Wave propagation measurements on two-dimensional lattice
[AD-A166207] N86-29891
Industrial inspection of grain size of precision tubes after heat treatment
[BLL-M-36744-(5828.4)] N86-30222
Ultrasonic analysis of thin adhesive bonds
[DE86-006515] N86-30224
ULTRASONIC WAVE TRANSDUCERS
A study of group-type single-phase unidirectional SAW transducers on LiNbO3 and quartz --- bandpass filters
[AD-A165670] N86-30067
ULTRAVIOLET ABSORPTION
Calcium and vitamin D metabolism in submariners: Carbon dioxide, sunlight and absorption considerations
[AD-A166292] N86-30306
ULTRAVIOLET LASERS
Studies on radiative collisional and ultraviolet lasers
[AD-A166193] N86-30139
ULTRAVIOLET RADIATION
UV cured epoxide coating
[DE86-003728] N86-30001
Comparative studies of electron affinities and work functions for GaAs amd Si
[AD-A166225] N86-30523
ULTRAVIOLET SPECTRA
Frequency quadrupled Nd-Yag laster for LEGS
[DE86-006133] N86-30152
UNDERGROUND EXPLOSIONS
Blasting and blast effects in cold regions. Part 1: Air blast
[AD-A166315] N86-30104
UNDERWATER ACOUSTICS
Nonlinear effects in long range underwater acoustic propagation
[AD-A166492] N86-30472
UNDERWATER ENGINEERING
Submerged arc welding control via arc sensing
[AD-A166320] N86-30207
UNDERWATER EXPLOSIONS
Blasting and blast effects in cold regions. Part 1: Air blast
[AD-A166315] N86-30104
Nonlinear effects in long range underwater acoustic propagation
[AD-A166492] N86-30472
UNITED STATES
Anomalous US weather patterns accompanying stratospheric sudden warming
[AD-A166371] N86-30290
UNIVERSITIES
A brief assessment of structural composite materials research in universities in the United States
[AD-A166665] N86-29910
United States Air Force Summer Faculty Research Program management report, 1985
[AD-A166175] N86-30561
UNSTEADY FLOW
Preliminary research on post-stall aerodynamics
[AD-A166279] N86-29780
Preliminary instrumentation for aeroelastic tests at the compressor level --- turbocompressor test bench
[ONERA-RT-95/7108-RY-054-R] N86-30219
UNSTEADY STATE
An entropy correction method for unsteady full potential flows with strong shocks
[NASA-TM-87769] N86-29777
UPPER ATMOSPHERE
Occultation of the ATS-3 satellite by the AVEFRIA barium ion cloud
[DE86-008346] N86-30282
AFOSR (Air Force Office of Scientific Research) Chemical and Atmospheric Sciences Program review (29th)
[AD-A166285] N86-30289
UPWASH
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] N86-29782
URBAN PLANNING
Visual aerial photograph testure discrimination for delineating homogeneous residential segtors: An instrument for urban planners
[INPE-3896-PRE/938] N86-30244
USER MANUALS (COMPUTER PROGRAMS)
NASA-VOF2D: a computer program for incompressible flows with free surfaces
[DE86-007195] N86-30116
Reference guide for using IGVIEW, an IGES compatible geometry display, editing, and analysis system
[DE86-007190] N86-30392
ASSIST: User's manual
[NASA-TM-87735] N86-30447
USER REQUIREMENTS
The DoD gateway information system: Prototype experience
[AD-A166200] N86-30570
Technology transfer and artificial intelligence
[AD-A166035] N86-30581

V

V/STOL AIRCRAFT
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] N86-29782
VACUUM CHAMBERS
Outgassing measurement of the aluminum alloy UHV chamber
[NASA-TM-88433] N86-29962
An environmentally-controlled extended-use small animal hypobaric chamber
[AD-A166729] N86-30307
VACUUM EFFECTS
Field calculations of axisymmetric current coils in vacuum
[ESA-86-97547] N86-30058
VANADIUM
Corrosion of vanadium and the alloy V 3Ti 1Si in flowing lithium
[KFK-4006] N86-29986
VANADIUM ALLOYS
Corrosion of vanadium and the alloy V 3Ti 1Si in flowing lithium
[KFK-4006] N86-29986
VANES
Self-retained platform cooling plate for turbine vane
[AD-D012218] N86-29822
Heat transfer test evaluation of the shell-spar blade cooling concept applied to industrial gas turbines N86-29837
VAPOR DEPOSITION
Gallium arsenide and multibandgap solar cell research
[DE85-016894] N86-30256
VAPOR PHASE EPITAXY
Selective low-pressure silicon epitaxy
[BMFT-FB-T-85-133] N86-30553
VAPOR PHASES
Laser induced fluorescence of FCO radicals in the gas phase
[MPIS-17/1985] N86-29950
Chemistry of new silicon containing polymers triply bonded silicon intermediates
[AD-A166085] N86-29990
VAPORS
Detection of chemical vapor mixtures by sorption on multiple piezoelectric crystals
[DE86-006698] N86-29941
VARACTOR DIODES
Low phase noise two port voltage controlled oscillator
[AD-D012234] N86-30077
VARIANCE (STATISTICS)
An improved test for the equality of coefficients of variation
[THE-RC-54335B] N86-30396
VARIATIONAL PRINCIPLES
Time dependent variational description of one-dimensional inelastic scattering
[DE86-700610] N86-30055
VARIATIONS
Confidence regions for variance components in unbalanced mixed linear models
[AD-A165841] N86-30428
VAX COMPUTERS
Ada (trade name) compilor validation summary report: Digital Equipment Corporation VAX Ada compiler version 1.1 VAX 8600, VAX-11/785, VAX-11/780, VAX-11/782, VAX-11/750, VAX-11/730, MicroVAX 1 and 2 VAXstation 1 and 2 using VAX/VMS and MicroVMS version 4.2 and VAXELN version 2
[AD-A166354] N86-30351
VECTOR SPACES
Dimension of binary convex structures
[IR-226] N86-30440
A codimension two bifurcation with a third order Picard-Fuchs equation
[IR-249] N86-30443
VEGA PROJECT
Hungarian space research 1981-1985: Lectures and review articles
[NASA-TM-87992] N86-30580
Preliminary results of measurements by automated probes Vega 1 and 2 or particle concentration in clouds of Venus at heights 47-63 KM
[NASA-TM-88424] N86-30618
VEGETATION
Microwave remote sensing and vegetation: Problems, progress and solutions, a review
[ESA-86-97556] N86-30250
Direct effects of increasing carbon dioxide on vegetation
[DE86-007397] N86-30267
VELOCITY DISTRIBUTION
On the advantages of the vorticity-velocity formulation of the equations of fluid dynamics
[NASA-CR-178125] N86-30101
VELOCITY MEASUREMENT
Two spot laser velocimeter measurements of velocity and turbulence intensity in shock tube driven turbine flows N86-29853
A 3-component laser-Doppler velocimeter data acquisition and reduction system
[NASA-CR-178929] N86-30135
A new instrument to measure charged and neutral cometary dust particles at low and high impact velocities N86-30590
Acoustic penetration and impact detector for micrometeoroid and space debris application N86-30594
A micrometeoroid deceleration and capture experiment: Conceptual experiment design description N86-30605
VENTILATION
Transient thermal behaviour of a compressor rotor with ventilation: Test results under simulated engine conditions N86-29856
Convective heat transfer from circular cylinders located within perforated cylindrical shrouds
[NASA-CR-4005] N86-30100
An environmentally-controlled extended-use small animal hypobaric chamber
[AD-A166729] N86-30307
VENUS (PLANET)
Numerical and experimental studies of particle flow in a high-pressure boundary-layer wind tunnel
[NASA-CR-177008] N86-30092
VENUS ATMOSPHERE
Numerical and experimental studies of particle flow in a high-pressure boundary-layer wind tunnel
[NASA-CR-177008] N86-30092
Preliminary results of measurements by automated probes Vega 1 and 2 or particle concentration in clouds of Venus at heights 47-63 KM
[NASA-TM-88424] N86-30618
VENUS CLOUDS
Preliminary results of determination of chemical element concentrations in the aerosol of Venus clouds
[NASA-TM-88423] N86-30617
Preliminary results of measurements by automated probes Vega 1 and 2 or particle concentration in clouds of Venus at heights 47-63 KM
[NASA-TM-88424] N86-30618

VENUS SURFACE
Numerical and experimental studies of particle flow in a high-pressure boundary-layer wind tunnel
[NASA-CR-177008] N86-30092
VERTEBRAL COLUMN
The vertebral column: Selection and aptitude of combat aircraft pilots of the future N86-30322
Systematic radiographic examination of the spine for selection of F-16 pilots: A preliminary report N86-30323
VERTICAL ORIENTATION
Modeling of elastically mounted vertical rotor N86-30168
VERY LARGE SCALE INTEGRATION
Macromodeling and optimization of digital MOS VLSI circuits
[AD-A166658] N86-30075
VIBRATION
Study of new flight test techniques
[NASA-CR-176952] N86-29812
Oil seal effects and subsynchronous vibrations in high-speed compressors N86-30176
VIBRATION DAMPING
Active flutter suppression on a delta wing model structure
[DFVLR-FB-86-01] N86-29870
ACOSS eleven (Active Control Of Space Structures) s
[AD-A165864] N86-29890
Simulation of non-linear bearing forces for post-stability investigation N86-30163
Turbine instabilities: Case histories N86-30166
Magnetic bearings for vibration control N86-30185
Rotor internal friction instability N86-30187
Aerodynamic instability: A case history N86-30190
Rotor instability due to loose rotating part N86-30198
VIBRATION MEASUREMENT
Certain rules governing damping of vibrations in two-phase alloys
[BLL-M-36760-(5828.4)] N86-29954
Instability in Rotating Machinery
[NASA-CP-2409] N86-30160
CO2 compressor vibration and cause analysis N86-30170
Hydraulic induced instability on a vertical service N86-30189
VIBRATION SIMULATORS
Fatigue test machine
[AD-D012232] N86-30133
VIBRATION TESTS
Active flutter suppression on a delta wing model structure
[DFVLR-FB-86-01] N86-29870
Measurement of rotor system dynamic stiffness by perturbation testing N86-30164
VIBRATIONAL SPECTRA
Cluster-model calculation of raman intensity for vibration of CO adsorbed on copper
[AD-A166239] N86-29934
CO2 compressor vibration and cause analysis N86-30170
Theoretical study of the radiative and kinetic properties of selected metal oxides and air molecules
[AD-A166113] N86-30521
VINYL COPOLYMERS
Synthesis of model polymers and related structures in support of vinyl monomer grafting studies
[DE86-008204] N86-30006
VISCOELASTICITY
Heat transfer, friction, and rheological characteristics of antimisting kerosene N86-30013
VISCOPLASTICITY
On the use of internal state variables in thermoviscoplastic constitutive equations N86-30231
VISCOSITY
Heat transfer, friction, and rheological characteristics of antimisting kerosene N86-30013
Jet fuel viscosity at low temperatures with notes on n-alkaline crystals
[NASA-CR-174911] N86-30022
VISCOUS DRAG
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] N86-29815
VISCOUS FLOW
On the advantages of the vorticity-velocity formulation of the equations of fluid dynamics
[NASA-CR-178125] N86-30101
Finite-element model in vorticity and current function for the numerical solution of the Navier-Stokes equations
[DE86-700787] N86-30109
VISION
Spatiotemporal characteristics of visual localization
[AD-A166097] N86-30331
VISUAL ACUITY
Entry visual standards and ocular examination techniques for future fighter aircrew N86-30317
The effect of spectrally selective filters on visual search performance
[AD-A165835] N86-30329
VISUAL AIDS
Entry visual standards and ocular examination techniques for future fighter aircrew N86-30317
VISUAL DISCRIMINATION
Entry visual standards and ocular examination techniques for future fighter aircrew N86-30317
The effect of background luminance and ambient illumination on color discrimination in a CRT display
[AD-A166297] N86-30496
VISUAL PERCEPTION
Medical Selection and Physiological Training of Future Fighter Aircrew
[AGARD-CP-396] N86-30309
Computer analysis of visual and vestibular oculomotor function in the medical selection of fighter aircrew members N86-30319
Visual capabilities related to fighter aircrew performance in the F-14 and adversary aircraft N86-30320
Vision test battery threshold and response time as predictors of air-to-air visual target acquisition in F-14 and adversary aircraft N86-30321
The effect of spectrally selective filters on visual search performance
[AD-A165835] N86-30329
The importance of specialized cognitive function in the selection of military pilots
[AD-A165389] N86-30330
Novel architectures for image processing based on computer simulation and psychophysical studies of human visual cortex
[AD-A166222] N86-30333
VISUAL STIMULI
Division of attention as a function of the number of steps, visual shifts, and memory load
[NASA-TM-88775] N86-30328
VISUAL TASKS
Entry visual standards and ocular examination techniques for future fighter aircrew N86-30317
Division of attention as a function of the number of steps, visual shifts, and memory load
[NASA-TM-88775] N86-30328
VOLTAGE CONTROLLED OSCILLATORS
Low phase noise two port voltage controlled oscillator
[AD-D012234] N86-30077
VOLTERRA EQUATIONS
Analytical methods for characterization of nonlinear devices and networks, volume 1
[AD-A165837] N86-30040
Stable compensation of nonlinear communications systems (using Volterra systems characterization), volume 2
[AD-A165838] N86-30041
VORTEX SHEDDING
Preliminary research on post-stall aerodynamics
[AD-A166279] N86-29780
VORTEX SHEETS
Calculations of axisymmetric vortex sheet roll-up using a panel and a filament model
[NASA-CR-177081] N86-29767
Vortex sheet modeling with higher order curved panels
[NASA-CR-176971] N86-29770
VORTICES
Motion and interaction of decaying trailing vortices in spanwise shear wind
[NASA-TP-2599] N86-29762
Analytical investigation of rotor wake formation and geometry
[NASA-CR-177032] N86-29768
Preliminary research on post-stall aerodynamics
[AD-A166279] N86-29780
Separated flows near the nose of a body of revolution
[NASA-CR-177107] N86-30091
Experimental results of the control of a vortical flow by tangential blowing
[NASA-CR-176932] N86-30094
Lyapunov stability of ideal compressible and incompressible fluid equilibria in three dimensions
[DE86-003648] N86-30107
Navier-Stokes equations by the finite element method
[DE86-700661] N86-30108
Finite-element model in vorticity and current function for the numerical solution of the Navier-Stokes equations
[DE86-700787] N86-30109
VORTICITY
On the advantages of the vorticity-velocity formulation of the equations of fluid dynamics
[NASA-CR-178125] N86-30101
VORTICITY EQUATIONS
Construction of higher order accurate vortex and particle methods
[NASA-CR-178132] N86-30096
Finite-element model in vorticity and current function for the numerical solution of the Navier-Stokes equations
[DE86-700787] N86-30109
VULNERABILITY
Application of systems analysis techniques to vulnerability studies of complex installations
[DE86-006012] N86-30223

W

WAFERS
Gallium arsenide and multibandgap solar cell research
[DE85-016894] N86-30256
WAKES
Motion and interaction of decaying trailing vortices in spanwise shear wind
[NASA-TP-2599] N86-29762
Component base flow analysis
[AD-A166283] N86-29781
Effects of wakes on the heat transfer in gas turbine cascades N86-29829
Wake-passing in a turbine rotor cascade N86-29830
The boundary layer behaviour of an advanced gas turbine rotor blade under the influence of simulated film cooling N86-29862
WALL FLOW
Adaptive wall wind tunnels: A selected, annotated bibliography
[NASA-TM-87639] N86-29871
WALL JETS
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] N86-29782
WALL PRESSURE
Improvements in code TUNCOR for calculating wall interference corrections in the transonic regime
[AD-A166766] N86-29783
Effects of hole geometry, wall curvature and pressure gradient on film cooling downstream of a single row --- gas turbine cooling N86-29831
WALL TEMPERATURE
Engine tests on a cooled gas turbine stage N86-29836
WALLS
Study of surfaces and surface layers on high temperature materials after short-time thermal loads --- tokamaks
[JUEL-2024] N86-30514
WALSH FUNCTION
Walsh-Fourier analysis of discrete-valued time series
[AD-A166139] N86-30430
WASTE DISPOSAL
Review of fracture properties of nuclear materials determined by Hertzian indentation
[DE86-005520] N86-30238
WATER
Mechanism of stress-corrosion cracking of Alloy X-750 in high purity water
[DE86-006361] N86-29969
Benchmark full configuration-interaction calculations on H2O, F- and F N86-30375
WATER QUALITY
Quality assurance for water sampling
[AD-A165842] N86-30263
WATER TEMPERATURE
USACRREL (US Army Cold Regions Research and Engineering Laboratory) precise thermistor meter
[AD-A166470] N86-30129
WATER WAVES
Wave observation at sea with the Dutch Side-Looking Airborne Radar (SLAR)
[I83.533.005] N86-30063
WAVE EQUATIONS
Nonlinear theory of the free-electron laser
[DE86-700668] N86-30146
WAVE FUNCTIONS
On the low-lying states of CuO N86-29928
Time dependent variational description of one-dimensional inelastic scattering
[DE86-700610] N86-30055
Molecular reaction rates
[AD-A166518] N86-30479
Theoretical study of the radiative and kinetic properties of selected metal oxides and air molecules
[AD-A166113] N86-30521
AGgaussian wave packet method for studying time dependent quantum mechanics in a curve crossing system: Low energy motion, tunneling and thermal dissipation
[AD-A166262] N86-30558

WAVE PACKETS
The magnetic effects of shallow water internal solitons
[AD-A165852] N86-30297
Mean trajectory gaussian wave packet approach to rotationally inelastic molecule-surface diffraction
[AD-A166275] N86-30478
A multiple Gaussian wave packet theory of H2 diffraction and rotational excitation by collision with solid surfaces
[AD-A166291] N86-30529
AGgaussian wave packet method for studying time dependent quantum mechanics in a curve crossing system: Low energy motion, tunneling and thermal dissipation
[AD-A166262] N86-30558
WAVE PROPAGATION
Proceedings of the 2nd Workshop on Planning and Sensing for Autonomous Navigation
[DE86-006813] N86-29808
Wave propagation measurements on two-dimensional lattice
[AD-A166207] N86-29891
Radar detection ranges, taking into account wave propagation phenomena
[REPT-13-85] N86-30034
Criteria for selection of graded index filter materials based on an analysis of wave propagation in a periodic medium
[AD-A166809] N86-30498
On experiments to detect possible failures of relativity theory
[DE86-700613] N86-30560
WAVEGUIDE ANTENNAS
A simple circular-polarized antenna: Circular waveguide horn coated with lossy magnetic material
[NASA-CR-177092] N86-30039
Electromagnetic fields in 3-D for various cavity antennas and Faraday shields
[DE86-007563] N86-30054
WAVEGUIDES
MMIC devices for active phased array antennas
[NASA-CR-176990] N86-30037
Asymmetrical coupled coplanar-type transmission lines with anisotropic substrates N86-30038
Wide-band distributed RF coupler
[AD-D012214] N86-30049
Infrared monitoring of gyrotron windows
[DE86-002449] N86-30134
Criteria for selection of graded index filter materials based on an analysis of wave propagation in a periodic medium
[AD-A166809] N86-30498
High pressure electron resonance studies of electronic, magnetic and structural phase transitions
[DE85-016971] N86-30544
WEAPON SYSTEMS
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] N86-29764
A program manager's guide on multiyear procurement
[AD-A166463] N86-30566
WEAR
Syn-fuel reciprocating charge pump improvement program
[DE86-007482] N86-30216
WEATHER
Anomalous US weather patterns accompanying stratospheric sudden warming
[AD-A166371] N86-30290
WEATHER FORECASTING
The development of agrometeorological services in Finland
[FMI-TN-31] N86-30286
Applications of satellite meteorology in support of space shuttle
[AD-A166227] N86-30288
AFOSR (Air Force Office of Scientific Research) Chemical and Atmospheric Sciences Program review (29th)
[AD-A166285] N86-30289
WEATHERING
Proceedings of the MECA Workshop on The Evoluation of the Martian Atmosphere
[NASA-CR-176899] N86-30614
WEIGHT REDUCTION
Study of new flight test techniques
[NASA-CR-176952] N86-29812
WEIGHTING FUNCTIONS
Weighted decoding of block linear codes
[ENST-86E001] N86-30395
WEIGHTLESSNESS
The temporal response of bone to unloading
[NASA-TM-89228] N86-30303
WELDED JOINTS
Submerged arc welding control via arc sensing
[AD-A166320] N86-30207
Cryogenic mechanical properties of high-manganese steel weldments
[DE86-005219] N86-30212
Use of acoustic emission in study of defects in butt weld during cooling
[BLL-M-36732-(5828.4)] N86-30221
WELDING
A 1000 amp ac/dc current source for the calibration of welding systems
[DE86-004924] N86-30211
Space Nuclear Safety Program
[DE86-007206] N86-30493
WHISKER COMPOSITES
Performance of commercial and research grade SiC whiskers in a borosilicate glass matrix
[DE86-007379] N86-29914
WHISTLERS
Shuttle contamination modeling: The plasma wave field of spacecraft
[AD-A166605] N86-29880
WHITE NOISE
Use of a virtual control approach in state estimation
[INPE-3903-PRE/944] N86-30453
WIGGLER MAGNETS
Desirable excitation patterns for tapered wigglers
[DE86-005997] N86-30149
WIND (METEOROLOGY)
Numerical and experimental studies of particle flow in a high-pressure boundary-layer wind tunnel
[NASA-CR-177008] N86-30092
Extreme winds and tornadoes: An overview
[DE86-006162] N86-30294
WIND EFFECTS
Some thoughts on the modeling of atmospheric turbulence from the perspective of a non-expert
[DE86-006498] N86-30281
WIND MEASUREMENT
The Delft University of Technology Scatterometer (DUTSCAT) report --- ESA C-band wind scatterometer
[ESA-86-97550] N86-30059
The ESA C-band wind scatterometer campaign: Preliminary campaign definition
[ESA-86-97552] N86-30060
WIND SHEAR
Perturbations of the Richardson number field by gravity waves
[NASA-CR-176910] N86-30273
The physical and empirical basis for a specific clear-air turbulence risk index
[NASA-CR-3971] N86-30285
WIND TUNNEL APPARATUS
The isentropic light piston annular cascade facility at RAE Pyestock N86-29851
WIND TUNNEL CALIBRATION
Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-176902] N86-29771
WIND TUNNEL MODELS
Thermal sensing of cryogenic wind tunnel model surfaces
[NASA-CR-178136] N86-30098
WIND TUNNEL TESTS
An investigation of tip planform influence on the aerodynamic load characteristics of a semi-span, unswept wing and wing-tip
[NASA-CR-177110] N86-29766
Effect of Reynolds Number and Mach Number on flow angularity probe sensitivity
[NASA-TM-87750] N86-29774
Comparisons of CFD flow field solutions with experimental data at Mach 14
[DE86-004915] N86-29784
Effectiveness measurements for a cooling film disrupted by a single jet with wall plunging N86-29844
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades N86-29861
The boundary layer behaviour of an advanced gas turbine rotor blade under the influence of simulated film cooling N86-29862
Flight determination of the aerodynamic stability and control characteristics of the NASA SGS 1-36 sailplane in the conventional and deep stall angles-of-attack of between -5 and 75 degrees
[NASA-CR-176962] N86-29865
Adaptive wall wind tunnels: A selected, annotated bibliography
[NASA-TM-87639] N86-29871
Computations and turbulent flow modeling in support of helicopter rotor technology
[NASA-CR-177095] N86-30090
Experimental results of the control of a vortical flow by tangential blowing
[NASA-CR-176932] N86-30094
WIND TUNNEL WALLS
Improvements in code TUNCOR for calculating wall interference corrections in the transonic regime
[AD-A166766] N86-29783
Adaptive wall wind tunnels: A selected, annotated bibliography
[NASA-TM-87639] N86-29871
WIND TUNNELS
The isentropic light piston annular cascade facility at RAE Pyestock N86-29851
Numerical and experimental studies of particle flow in a high-pressure boundary-layer wind tunnel
[NASA-CR-177008] N86-30092
WIND TURBINES
Design and initial testing of a one-bladed 30-meter-diameter rotor on the NASA/DOE mod-O wind turbine
[NASA-TM-88810] N86-30251
Wind turbine fatigue considerations
[DE86-006499] N86-30257
Some thoughts on the modeling of atmospheric turbulence from the perspective of a non-expert
[DE86-006498] N86-30281
WIND VELOCITY
Some thoughts on the modeling of atmospheric turbulence from the perspective of a non-expert
[DE86-006498] N86-30281
Pacific Northwest Wind Regional Energy Assessment Program. Volume 2. Appendix
[DE86-007114] N86-30296
WINDPOWER UTILIZATION
Design and initial testing of a one-bladed 30-meter-diameter rotor on the NASA/DOE mod-O wind turbine
[NASA-TM-88810] N86-30251
Control of windpowered station with variable speed; small range
[FOA-C-20600-E3] N86-30261
Control research in windpower project 506259-1 control FOA, stage 1
[FOA-C-20601-E3] N86-30262
Pacific Northwest Wind Regional Energy Assessment Program. Volume 2. Appendix
[DE86-007114] N86-30296
WINDPOWERED GENERATORS
Control of windpowered station with variable speed; small range
[FOA-C-20600-E3] N86-30261
Control research in windpower project 506259-1 control FOA, stage 1
[FOA-C-20601-E3] N86-30262
WING LOADING
Vortex sheet modeling with higher order curved panels
[NASA-CR-176971] N86-29770
WINGS
Transonic Navier-Stokes wing solution using a zonal approach. Part 1: Solution methodology and code validation
[NASA-TM-88248] N86-29765
An investigation of tip planform influence on the aerodynamic load characteristics of a semi-span, unswept wing and wing-tip
[NASA-CR-177110] N86-29766
Analytical investigation of rotor wake formation and geometry
[NASA-CR-177032] N86-29768
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-88265] N86-29813
WIRE WINDING
Study of new flight test techniques
[NASA-CR-176952] N86-29812
WOOD
Investigation of surface strains in fir tree turbine blade attachments
[AD-A166330] N86-29821
WORDS (LANGUAGE)
Artificial intelligence indexing: Creating knowledge bases of index terms ordered by semantic relations
[AD-A166768] N86-30574
WORKING FLUIDS
Modeling of transient heat pipe operation
[NASA-CR-177143] N86-30099
WORKLOADS (PSYCHOPHYSIOLOGY)
Feasibility study for ergonomic analysis and design of future helicopter cockpit systems
[NASA-CR-176942] N86-29811
An investigation of the use of steady-state evoked potentials for human performance and workload assessment and control
[AD-A166205] N86-30332
WORKSTATIONS
Remote access for NAS: Supercomputing in a university environment
[NASA-CR-177020] N86-30370

WROUGHT ALLOYS
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A166466] N86-29968

X

X RAY ABSORPTION
X-ray studies of the solid-electrolyte interface
[DE86-003639] N86-29943
X RAY ANALYSIS
X-ray studies of the solid-electrolyte interface
[DE86-003639] N86-29943
X RAY ASTRONOMY
X-ray satellite (Rosat)
[NASA-TM-88481] N86-29689
X RAY LASERS
Non-LTE atomic physics model for laser fusion and X-ray laser simulation
[DE86-006487] N86-30145
Theory and analysis of soft X-ray laser experiments
[DE86-005177] N86-30148
X RAY SOURCES
Cosmic X-ray physics
[NASA-CR-177227] N86-30624
X RAYS
Cosmic X-ray physics
[NASA-CR-177227] N86-30624
X WING ROTORS
Aerospace Safety Advisory Panel report to the NASA acting administrator
[NASA-TM-89226] N86-29879
X-29 AIRCRAFT
Aerospace Safety Advisory Panel report to the NASA acting administrator
[NASA-TM-89226] N86-29879
XV-15 AIRCRAFT
An experimental and analytical method for approximate determination of the tilt rotor research aircraft rotor/wing download
[NASA-CR-176970] N86-29769

Z

ZINC SELENIDES
Acta Optica Sinica (selected articles)
[AD-A166281] N86-30495
ZINC SULFIDES
Acta Optica Sinica (selected articles)
[AD-A166281] N86-30495
ZIRCALOYS (TRADEMARK)
Microstructure effects on ion and electron transport parameters during passive corrosion of zircaloy
[DE86-007189] N86-29979

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The NASA accession number denotes the number by which the citation is identified.

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

AD-EX TRANSLATIONS INTERNATIONAL/USA, MENLO PARK, CALIF.
Cutting of metal components by intergranular cracking
[DE86-006949] N86-30213

ADVISORY GROUP FOR AEROSPACE RESEARCH AND DEVELOPMENT, NEUILLY-SUR-SEINE (FRANCE).
Analogue signal conditioning for flight test instrumentation
[AGARD-AG-160-VOL-17] N86-29816
Heat Transfer and Cooling in Gas Turbines
[AGARD-CP-390] N86-29823
Medical Selection and Physiological Training of Future Fighter Aircrew
[AGARD-CP-396] N86-30309

AERONAUTICAL SYSTEMS DIV., WRIGHT-PATTERSON AFB, OHIO.
Ada (trade name) compiler validation summary report: Intermetrics, inc. I2Ada compiler, version 17.08 for the IBM 370 architecture under UTS 2.3
[AD-A166818] N86-30353

AGRICO CHEMICAL CO., DONALDSONVILLE, LA.
Topping turbine (103-JAT) rotor instability in 1150-STPD Kellogg ammonia plants N86-30188

AIR COMMAND AND STAFF COLL., MAXWELL AFB, ALA.
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] N86-29764
Will the USAF need ground-based air traffic control radar in the year 2000?
[AD-A166504] N86-29805
A program manager's guide on multiyear procurement
[AD-A166463] N86-30566

AIR FORCE ACADEMY, COLO.
Advanced laser based inertial instrument development
[AD-A166307] N86-30128

AIR FORCE GEOPHYSICS LAB., HANSCOM AFB, MASS.
Shuttle contamination modeling: The plasma wave field of spacecraft
[AD-A166605] N86-29880
Spacecraft sheath modification during beam ejection
[AD-A166604] N86-29895
Turbulent heating and transfer in the stratosphere and lower mesosphere
[AD-A166591] N86-30276

AIR FORCE INST. OF TECH., WRIGHT-PATTERSON AFB, OHIO.

[ER-84/05] N86-30415
Iterative methods for nondefinite symmetric systems, with application to a discrete Stokes problem
[ESA-86-97548] N86-30416
The estimation of minimal polynomial coefficients and a start sequence of Markov parameters
[ESA-86-97519] N86-30445
Identification of multivariable systems and representation in canonical and pseudo-canonical form
[ESA-86-97520] N86-30446
Valid inequalities for mixed 0-1 problems
[ESA-86-97305] N86-30459
A note on the evaluation of the mean value scheme for closed multichain queueing networks
[MEMO-COSOR-84-04] N86-30460
Fiber optical data link extension for the IEC-625 interface bus
[ESA-86-97532] N86-30505
An investigation of discharge structures in the submillimeter band in an MHD generator
[VDF-NT-84-16] N86-30516

TECHNISCHE HOGESCHOOL TWENTE, ENSCHEDE (NETHERLANDS).
Residual stress and deformation energy under ground-surfaces of brittle solids
[WB-85-16] N86-30241
An algorithm to find minimal sequences of pass directions for attribute grammars
[INF-83-6] N86-30399
A notation for the most general form of repetition
[INF-84-3] N86-30400
Exception handling constructs considered unnecessary
[INF-84-6] N86-30401

Functions within the data communication layers of the ISO Open Systems Interconnection (OSI) model
[INF83/IPS/042] N86-30409
A formal description technique and the ISO transport layer
[INF83/IPS/007] N86-30410
One-parameter families of optimization problems: Equality constraints
[ESA-86-97357] N86-30444
Critical sets in parametric optimization
[ESA-86-97358] N86-30466

TECHNISCHE UNIV., AACHEN (WEST GERMANY).
Effect of film cooling on the aerodynamic performance of a turbine cascade N86-29859

TECHNISCHE UNIV., DARMSTADT (WEST GERMANY).
Remarks on rotor stability (A contribution to discussion during symposium on instability in rotating machinery) N86-30191

TECHNISCHE UNIV., MUNICH (WEST GERMANY).
Acoustic penetration and impact detector for micrometeoroid and space debris application N86-30584
Cosmic dust detection with large surface piezoceramics N86-30604

TECHNISCHE UNIV., VIENNA (AUSTRIA).
Changes of instability thresholds of rotor due to bearing misalignments N86-30193

TENNESSEE VALLEY AUTHORITY, SODDY-DAISY.
Vertical reactor coolant pump instabilities N86-30182

TEXAS A&M UNIV., COLLEGE STATION.
Experimental and theoretical study of propeller spinner/shank interference
[NASA-CR-176954] N86-29773
Experimental verification and practical application of torquewhirl theory of rotordynamic instability N86-30169
Integrated research in constitutive modelling at elevated temperatures, part 1
[NASA-CR-177237] N86-30227
Integrated research in constitutive modelling at elevated temperatures: Summary of the project N86-30228
Numerical considerations in the development and implementation of constitutive models N86-30229
Evaluation of the numerical stability and sensitivity of material parameter variations for several unified constitutive models
[MM-4998-85-6-PT-1] N86-30230
On the use of internal state variables in thermoviscoplastic constitutive equations N86-30231
A comparison of current models for nonlinear rate-dependent material behavior of crystalline solids N86-30232

TEXAS TECHNOLOGICAL COLL., LUBBOCK.
A canonical form for nonlinear systems
[NASA-CR-176974] N86-30371

TEXAS TECHNOLOGICAL UNIV., LUBBOCK.
Extreme winds and tornadoes: An overview
[DE86-006162] N86-30294
Approximations of nonlinear systems having outputs
[NASA-CR-176946] N86-30417

TEXAS UNIV., AUSTIN.
Nonlinear effects in long range underwater acoustic propagation
[AD-A166492] N86-30472
Two dimensional analytical considerations of large magnetic and electric fields in laser produced plasmas
[DE86-00235] N86-30512

TORONTO UNIV. (ONTARIO).
Charge accumulation and arc discharges on spacecraft materials and components
[AD-A166216] N86-29893
Molecular dynamics of reactions forming electronically excited products
[AD-A166168] N86-29931

TRENT POLYTECHNIC, NOTTINGHAM (ENGLAND).
Effectiveness measurements for a cooling film disrupted by a single jet with wall plunging N86-29844

TRI-UNIV. MESON FACILITY, VANCOUVER (BRITISH COLUMBIA).
500 MHz CCD serial analog memory
[DE86-901019] N86-30084

TRW DEFENSE SYSTEMS GROUP, HUNTSVILLE, ALA.
One approach for evaluating the Distributed Computing Design System (DCDS) N86-30366

U

UNITED TECHNOLOGIES RESEARCH CENTER, EAST HARTFORD, CONN.
Role of fuel chemical properties on combustor radiative heat load
[NASA-CR-177096] N86-30023
Theoretical study of the radiative and kinetic properties of selected metal oxides and air molecules
[AD-A166113] N86-30521

UNIVERSAL ENERGY SYSTEMS, INC., DAYTON, OHIO.
Criteria for selection of graded index filter materials based on an analysis of wave propagation in a periodic medium
[AD-A166809] N86-30498
United States Air Force Summer Faculty Research Program management report, 1985
[AD-A166175] N86-30561
United States Air Force Summer Faculty Research Program, 1985 technical report, volume 1
[AD-A166176] N86-30562
United States Air Force Summer Faculty Research Program, 1985 technical report, volume 2
[AD-A166177] N86-30563
United States Air Force Summer Faculty Research Program 1985 technical report, volume 3
[AD-A166178] N86-30564

UNIVERSIDADE ESTADUAL DE CAMPINAS (BRAZIL).
Considerations about the apparent superluminal expansions in astrophysics
[DE86-701328] N86-30613

UNIVERSIDADE FEDERAL DE PARAIBA (BRAZIL).
Modeling of elastically mounted vertical rotor N86-30168

UNIVERSITY OF SOUTH FLORIDA, TAMPA.
Analytical methods for characterization of nonlinear devices and networks, volume 1
[AD-A165837] N86-30040
Stable compensation of nonlinear communications systems (using Volterra systems characterization), volume 2
[AD-A165838] N86-30041

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES.
Chemistry of new silicon containing polymers triply bonded silicon intermediates
[AD-A166085] N86-29990

UNIVERSITY OF SOUTHERN COLORADO, PUEBLO.
Technology research for strapdown inertial experiment and digital flight control and guidance
[NASA-CR-176907] N86-29800

V

VARIAN ASSOCIATES, PALO ALTO, CALIF.
Infrared monitoring of gyrotron windows
[DE86-002449] N86-30134

VETERANS ADMINISTRATION HOSPITAL, SAN FRANCISCO, CALIF.
The temporal response of bone to unloading
[NASA-TM-89228] N86-30303

VIRGINIA UNIV., CHARLOTTESVILLE.
Oil seal effects and subsynchronous vibrations in high-speed compressors N86-30176
An experimental evaluation of error seeding as a program validation technique N86-30362

VON KARMAN INST. FOR FLUID DYNAMICS, RHODE-SAINT-GENESE (BELGIUM).
External heat transfer study on a HP turbine rotor blade N86-29828

VRIJE UNIVERSITEIT, AMSTERDAM (NETHERLANDS).
Report on the AI trip
[IR-82] N86-30397
A relational database environment for software development
[IR-86] N86-30398
Protection and resource control in distributed operating systems
[IR-79] N86-30408
A fast, tree-based access method
[IR-85] N86-30439
Dimension of binary convex structures
[IR-226] N86-30440
Continuity of convexity preserving functions
[IR-237] N86-30441
On moderate and large deviations in multinomial distributions
[IR-242] N86-30442
A codimension two bifurcation with a third order Picard-Fuchs equation
[IR-249] N86-30443
The number of classes in chi-square goodness of fit tests
[IR-246] N86-30451
A simple example where the jacknife fails
[IR-256] N86-30452
Closed images of topological groups
[IR-243] N86-30463
Chebyshev sets and continuous position
[IR-245] N86-30464
Descriptive complexity of function spaces
[IR-278] N86-30465

W

WASHINGTON STATE UNIV., PULLMAN.
Electronic spectra of various liquids under shock conditions
[AD-A166510] N86-29936
Investigation of basic characteristics of laser heating in thermoluminescence and of laser-stimulated luminescence
[AD-A166089] N86-30138

WASHINGTON UNIV., SEATTLE.
An introduction to ice in the polar oceans
[AD-A166140] N86-30298

WASHINGTON UNIV., ST. LOUIS, MO.
Interplanetary dust: The interstellar connection N86-30587
Prospects for an orbital determination and capture cell experiment N86-30588

WESTINGHOUSE CANADA, INC., HAMILTON (ONTARIO).
Heat transfer test evaluation of the shell-spar blade cooling concept applied to industrial gas turbines N86-29837

WESTINGHOUSE ELECTRIC CORP., CHESWICK, PA.
Cracked shaft detection on large vertical nuclear reactor coolant pump N86-30180

WESTINGHOUSE ELECTRIC CORP., PITTSBURGH, PA.
Laser-assisted solar cell metallization processing
[DE86-008328] N86-30260

WESTINGHOUSE RESEARCH AND DEVELOPMENT CENTER, PITTSBURGH, PA.
Double-injection, deep-impurity switch development
[NASA-CR-174936] N86-30073
Superconducting electronic film structures
[AD-A166183] N86-30522

WISCONSIN UNIV., MADISON.
Nucleation of allotropic phases during pulsed laser annealing of manganese
[DE86-004584] N86-29973
Molecular reaction rates
[AD-A166518] N86-30479
Cosmic X-ray physics
[NASA-CR-177227] N86-30624

WU (JIUNN-JENQ), SIERRA MADRE, CALIF.
Experiments on high speed ejectors
[NASA-CR-177419] N86-29820

Typical Contract Number Index Listing

DE-AC06-77RL-01030 ..... N86-10633

CONTRACT NUMBER — NASA ACCESSION NUMBER

Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

REPORT/ACCESSION NUMBER INDEX

Typical Report Number Index Listing

Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

INFORMATION
BRANCH

NASA

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

WHAT YOU CAN DO FOR *STAR*

All users of this abstract service are urged to forward reports to be considered for announcement in *STAR*. This will aid NASA in its efforts to provide the fullest possible coverage of all scientific and technical publications that might support aeronautics and space research and development. If you have prepared relevant reports (other than those that you will transmit to NASA, DoD, or DOE through the usual contract- or grant-reporting channels), please send them for consideration to the NASA Scientific and Technical Information Facility, P.O. Box 8757, B.W.I. Airport, Maryland 21240.

Reprints of journal articles, book chapters, and conference papers are also welcome. These will be considered for announcement in *STAR's* companion journal, *International Aerospace Abstracts*.

You may specify a particular source to be included in a report announcement if you wish; otherwise the report will be placed on public sale at the National Technical Information Service. Copyrighted publications will be announced but not distributed or sold.

PURCHASE OF *STAR*

The semimonthly issues are available for sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

PUBLISHED BY:

UNITED STATES GOVERNMENT
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
SCIENTIFIC AND TECHNICAL INFORMATION BRANCH
Scientific and Technical Aerospace Reports, Volume 24, is prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by RMS Associates.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through March 22, 1988.

US ISSN 0036-8741

INTRODUCTION

Scientific and Technical Aerospace Reports (STAR) is a major component of a comprehensive National Aeronautics and Space Administration information system covering aeronautics, space, and supporting disciplines. *STAR* is issued on the 8th and 23rd of each month and announces current publications of the following types:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institutions, universities, and private firms
- Translations in report form
- NASA-owned patents and patent applications
- Dissertations and theses

Cumulative index volumes are published annually.

Journal, book, and conference literature, cover-to-cover journal translations, and certain foreign dissertations are announced in a companion journal, *International Aerospace Abstracts (IAA)*, available on subscription from the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

SUBJECT SCOPE

Subject scope of *STAR*, and *IAA* includes all aspects of aeronautics and space research and development, supporting basic and applied research, and applications. Aerospace aspects of earth resources, energy development, conservation, oceanography, environmental protection, urban transportation, and other topics of high national priority are also covered.

OTHER NASA PUBLICATIONS

Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P.O. Box 8757, B.W.I. Airport, Maryland 21240.

HOW TO USE *STAR* SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 74 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche[1] are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Adminstration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its' Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free. (See discussion of NASA patents and patent applications below.)

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address.

Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02. Microfiche are sold at price code A01. The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at $1.50 per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;
2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
ATTN: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF *STAR* ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue and other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subscription rates are $70.00 North America; $140.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC: NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN: An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA - Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

VOLUME 24 NUMBER 22 / NOVEMBER 23, 1986

TABLE OF CONTENTS

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

01 AERONAUTICS (GENERAL) 3401

02 AERODYNAMICS 3410
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.
For related information see also *34 Fluid Mechanics and Heat Transfer*

03 AIR TRANSPORTATION AND SAFETY 3412
Includes passenger and cargo air transport operations; and aircraft accidents.
For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation*.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 3414
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.
For related information see also *17 Spacecraft Communications, Command and Tracking* and *32 Communications*.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 3415
Includes aircraft simulation technology.
For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics*.

06 AIRCRAFT INSTRUMENTATION 3417
Includes cockpit and cabin display devices; and flight instruments.
For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography*.

07 AIRCRAFT PROPULSION AND POWER 3417
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.
For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

08 AIRCRAFT STABILITY AND CONTROL 3419
Includes aircraft handling qualities; piloting; flight controls; and autopilots.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 3420
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.
For related information see also *14 Ground Support Systems and Facilities (Space)*.

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*

12 ASTRONAUTICS (GENERAL) 3421
For extraterrestrial exploration see *91 Lunar and Planetary Exploration*.

13 ASTRODYNAMICS 3421
Includes powered and free-flight trajectories; and orbit and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) 3421
Includes launch complexes, research and production facilities, ground support equipment, e.g., mobile transporters; and simulators.
For related information see also *09 Research and Support Facilities (Air)*.

15 LAUNCH VEHICLES AND SPACE VEHICLES 3422
Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

16 SPACE TRANSPORTATION 3423
Includes passenger and cargo space transportation, e.g., shuttle operations; and rescue techniques.
For related information see also *03 Air Transportation and Safety* and *85 Urban Technology and Transportation*.

17 SPACECRAFT COMMUNICATION, COMMAND AND TRACKING 3423
Includes telemetry; space communications networks; astronavigation; and radio blackout.
For related information see also *04 Aircraft Communications and Navigation* and *32 Communications*.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE 3424
Includes spacecraft thermal and environmental control; and attitude control.
For life support systems see *54 Man/System Technology and Life Support*. For related information see also *05 Aircraft Design, Testing and Performance* and *39 Structural Mechanics*.

19 SPACECRAFT INSTRUMENTATION 3431
For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography*.

20 SPACECRAFT PROPULSION AND POWER 3431
Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.
For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

23 CHEMISTRY AND MATERIALS (GENERAL) **3432**
Includes biochemistry and organic chemistry.

24 COMPOSITE MATERIALS **3432**
Includes laminates.

25 INORGANIC AND PHYSICAL CHEMISTRY **3433**
Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.
For related information see also *77 Thermodynamics and Statistical Physics*.

26 METALLIC MATERIALS **3436**
Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS **3441**
Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

28 PROPELLANTS AND FUELS **3444**
Includes rocket propellants, igniters, and oxidizers; storage and handling; and aircraft fuels.
For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power*, and *44 Energy Production and Conversion*.

ENGINEERING

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.
For related information see also *Physics*.

31 ENGINEERING (GENERAL) **3445**
Includes vacuum technology; control engineering; display engineering; and cryogenics.

32 COMMUNICATIONS **3445**
Includes land and global communications; communications theory; and optical communications.
For related information see also *04 Aircraft Communications and Navigation* and *17 Spacecraft Communications, Command and Tracking*.

33 ELECTRONICS AND ELECTRICAL ENGINEERING **3451**
Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuity.
For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics*.

34 FLUID MECHANICS AND HEAT TRANSFER **3455**
Includes boundary layers; hydrodynamics; fluidics; mass transfer; and ablation cooling.
For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics*.

35 INSTRUMENTATION AND PHOTOGRAPHY **3466**
Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.
For aerial photography see *43 Earth Resources*. For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation*.

36 LASERS AND MASERS **3468**
Includes parametric amplifiers.

37 MECHANICAL ENGINEERING **3470**
Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY **3472**
Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS **3473**
Includes structural element design and weight analysis, fatigue; and thermal stress.
For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance*.

GEOSCIENCES

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.
For related information see also *Space Sciences*.

42 GEOSCIENCES (GENERAL) **3477**

43 EARTH RESOURCES **3478**
Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.
For instrumentation see *35 Instrumentation and Photography*.

44 ENERGY PRODUCTION AND CONVERSION **3479**
Includes specific energy conversion systems, e.g., fuel cells and batteries; global sources of energy; fossil fuels; geophysical conversion; hydroelectric power; and wind power.
For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels*, and *85 Urban Technology and Transportation*.

45 ENVIRONMENT POLLUTION **3482**
Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

46 GEOPHYSICS **3483**
Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.
For space radiation see *93 Space Radiation*.

47 METEOROLOGY AND CLIMATOLOGY **3494**
Includes weather forecasting and modification.

48 OCEANOGRAPHY **3496**
Includes biological, dynamic and physical oceanography; and marine resources.

LIFE SCIENCES

Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

51 LIFE SCIENCES (GENERAL) **3498**
Includes genetics.

52 AEROSPACE MEDICINE **3499**
Includes physiological factors; biological effects of radiation; and weightlessness.

53 BEHAVIORAL SCIENCES **3500**
Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT **3500**
Includes human engineering; biotechnology; and space suits and protective clothing.

55 PLANETARY BIOLOGY **3502**
Includes exobiology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) **3502**

60 COMPUTER OPERATIONS AND HARDWARE **3502**
Includes computer graphics and data processing.
For components see *33 Electronics and Electrical Engineering*.

61 COMPUTER PROGRAMMING AND SOFTWARE **3503**
Includes computer programs, routines, and algorithms.

62 COMPUTER SYSTEMS **3508**
Includes computer networks.

63 CYBERNETICS **3508**
Includes feedback and control theory.
For related information see also *54 Man/System Technology and Life Support*.

64 NUMERICAL ANALYSIS **3510**
Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY **3514**
Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS **3515**
Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS **3516**
Includes topology and number theory.

PHYSICS

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.
For related information see also *Engineering*.

70 PHYSICS (GENERAL) **3517**
For geophysics see *46 Geophysics*. For astrophysics see *90 Astrophysics*. For solar physics see *92 Solar Physics*.

71 ACOUSTICS **3517**
Includes sound generation, transmission, and attenuation.
For noise pollution see *45 Environment Pollution*.

72 ATOMIC AND MOLECULAR PHYSICS **3519**
Includes atomic structure and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS **3520**
Includes elementary and nuclear particles; and reactor theory.
For space radiation see *93 Space Radiation*.

74 OPTICS **3521**
Includes light phenomena.

75 PLASMA PHYSICS **3523**
Includes magnetohydrodynamics and plasma fusion.
For ionospheric plasmas see *46 Geophysics*. For space plasmas see *90 Astrophysics*.

76 SOLID-STATE PHYSICS **3524**
Includes superconductivity.
For related information see also *33 Electronics and Electrical Engineering* and *36 Lasers and Masers*.

77 THERMODYNAMICS AND STATISTICAL PHYSICS **3528**
Includes quantum mechanics; and Bose and Fermi statistics.
For related information see also *25 Inorganic and Physical Chemistry* and *34 Fluid Mechanics and Heat Transfer*.

SOCIAL SCIENCES

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

80 SOCIAL SCIENCES (GENERAL) **3529**
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT **3535**
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE **3535**
Includes information storage and retrieval technology; micrography; and library science.
For computer documentation see *61 Computer Programming and Software*.

83 ECONOMICS AND COST ANALYSIS **N.A.**
Includes cost effectiveness studies.

84 LAW AND POLITICAL SCIENCE **3536**
Includes space law; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION **3537**
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation.
For related information see *03 Air Transportation and Safety*, *16 Space Transportation*, and *44 Energy Production and Conversion*.

SPACE SCIENCES

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.
For related information see also *Geosciences*.

88 SPACE SCIENCES (GENERAL) **N.A.**

89 ASTRONOMY **3538**
Includes radio and gamma-ray astronomy; celestial mechanics; and astrometry.

90 ASTROPHYSICS **3540**
Includes cosmology; and interstellar and interplanetary gases and dust.

91 LUNAR AND PLANETARY EXPLORATION **3541**
Includes planetology; and manned and unmanned flights.
For spacecraft design see *18 Spacecraft Design, Testing and Performance*. For space stations see *15 Launch Vehicles and Space Vehicles*.

92 SOLAR PHYSICS **3542**
Includes solar activity, solar flares, solar radiation and sunspots.

93 SPACE RADIATION **3542**
Includes cosmic radiation; and inner and outer earth s radiation belts.
For biological effects of radiation see *52 Aerospace Medicine*. For theory see *73 Nuclear and High-Energy Physics*.

COSATI CODE

A recently developed multiple scale turbulence model is used for the numerical prediction of isothermal, confined turbulent swirling flows. Because of the streamline curvature and nonequilibrium spectral energy transfer nature of the swirling flow, the utilized multiple scale turbulence model includes a different set of response equations for each of the large scale energetic eddies and the small scale transfer eddies. Predictions are made of a confined coaxial swirling jet in a sudden expansion and comparisons are made with experimental data and with the conventional single scale two equation model. The multiple scale model shows significant improvement of predictions of swirling flows over the single scale k epsilon model. The sensitivity study of the effect of prescribed inlet turbulence levels on the flow fields is also included. Author

TRANSONIC EQUIVALENT STRIP METHOD FOR AEROELASTIC APPLICATIONS **c02**
D. D. Liu, Y. F. Kao, and K. Y. Fung (Arizona Univ., Tucson) *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 17-32 Sponsored by DTNSRDC/NAVAIR (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

For unsteady flow computations of arbitrary wing planforms including control surfaces, a method based on the transonic equivalent strip (TES) model is developed. It consists of two consecutive correction steps to a given unsteady two-dimensional code. The latter can be a time-linearized transonic code or a nonlinear one such as LTRAN2 code. The mean-flow correction step involves an equivalent airfoil design procedure; the spanwise phase correction step accounts for the effects of acoustic wave propagation in three dimensions. Computed results using the TES method are compared with those obtained by methods such as versions of XTRAN3 code, Isogai's full potential code, and measured data. Computed cases include the Northrop F-5 wing in pitching oscillation, the AGARD standard RAE wing with an oscillating flap, and the LANN wing in pitching oscillation. ESA

CALCULATION OF THREE-DIMENSIONAL TRANSONIC POTENTIAL FLOWS BY A FIELD PANEL METHOD **c02**
R. Voss *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 33-46 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

A calculation method for three dimensional transonic flows around oscillating wings is described. It solves the time-linearized unsteady transonic small perturbation equation by an integral equation method with a field panel technique. In a computer code called PTRAN3, the field panel technique is combined with a finite difference method. Accuracy and computer costs of the code are acceptable for routine flutter applications. Results for applications to pitching motions of a rectangular wing and two swept wings (LANN wing and F5 wing) with high and low aspect ratio are shown. ESA

APPLICATION OF TRANSONIC UNSTEADY METHODS FOR CALCULATION OF FLUTTER AIRLOADS **c08**
H. Zimmermann and S. Vogel *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 47-61 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

The supercritical MBB-A3 profile was used as an example for calculating steady and unsteady pressure distribution by unsteady transonic codes. Most of the calculations were performed using the nonlinear TSP-equation and its time linearized form solved by a time marching method and by an integral method. The influence of the coefficient of the nonlinear term, of the inclusion of the steady or quasi-steady boundary layer thickness, and of the fulfillment of the Rankine-Hugoniot condition on the resulting pressure distribution is shown. Flutter calculations were made for a two degree of freedom representative section. The resulting critical speeds show a considerable variation depending on which method was used. Results show that there are good arguments for using time-linearized TSP methods in flutter calculations in the transonic domain. ESA

EXACT CLOSED-FORM SOLUTIONS FOR NONLINEAR UNSTEADY TRANSONIC AERODYNAMICS **c02**
Gabriel A. Oyibo *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 71-78 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

The existence of exact closed-form solutions for nonlinear unsteady aerodynamics is established. The full nonlinear unsteady velocity potential equations for an airfoil are considered. Evidence indicating why the traditional hodograph approach is ineffective for solving these equations is provided. A mapping scheme transforms these full nonlinear equations into the hodograph plane. Examination of the resulting hodograph equations reveals that by prescribing the Jacobian of the transformation, ab initio, the exact closed-form solutions can be obtained for the nonlinear unsteady aerodynamic characteristics of an airfoil in a potential flow. The shockless transonic results for inviscid analysis show trends that agree with previous data. Dips are observed in the pressure distributions as the free stream Mach number is varied. There are finite optimum reduced frequencies (Strouhal numbers) for the pressure distributions. This suggests a solution to the transonic dip problem associated with aeroelastic stability characteristics at transonic Mach numbers. ESA

N86-30632# Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Goettingen (West Germany). Inst. of Aeroelasticity.

STEADY AND UNSTEADY PRESSURE DISTRIBUTION ON VARIOUS PROFILES IN SEPARATED SUBSONIC AND TRANSONIC FLOW c02

H. Triebstein *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 99-119 (For primary document see N86-30627 22-01)

Avail: NTIS HC A99/MF E03

Steady, mean, and unsteady aerodynamic data were measured on two dimensional rectangular wings, one with a supercritical MBB-Va2 profile and one with a NACA 0012 in subsonic flow and another supercritical MBB-A3 profile in transonic flow. The measurements were performed to produce systematic results with respect to Mach number, reduced frequency, incidence (wing, spoiler, tab) and amplitude of oscillation, and for use in the development and assessment of subsonic and transonic codes. The higher harmonic parts of the unsteady pressure in the region of pressure jumps and flow separation are emphasized. The wind tunnels, test setups, wing configurations, electronic data recording and processing devices, and the measuring procedure are described. ESA

N86-30633# Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Goettingen (West Germany).

AN IMPROVED POTENTIAL GRADIENT METHOD FOR THE CALCULATION OF UNSTEADY AERODYNAMIC PRESSURES ON OSCILLATING WINGS IN SUPERSONIC FLOW c02

F.-Q. Zhang and H. Foersching *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 153-162 (For primary document see N86-30627 22-01)

Avail: NTIS HC A99/MF E03

A method to calculate pressure distributions on harmonically oscillating wings is presented. The method uses an integral variable substitution, by which the computer time is reduced considerably together with an improvement of computation accuracy, especially for low supersonic Mach numbers and high reduced frequencies. Comparisons with other methods and experimental results show quite satisfactory agreement. ESA

N86-30634# Tel-Aviv Univ. (Israel). Dept. of Solid Mechanics, Materials and Structures.

AN EXACT FORMULATION OF THE UNSTEADY AERODYNAMIC THEORY OF LIFTING SURFACES UNDERGOING ARBITRARY SMALL MOTIONS IN A SUPERSONIC FLOW FIELD c02

Liviu Librescu *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 163-168 (For primary document see N86-30627 22-01)

Avail: NTIS HC A99/MF E03

The indirect theory of unsteady lifting surfaces is developed. The integral equation (IE) relating a known downwash distribution to an unknown pressure distribution is derived without any restriction on the time dependence of field variables. The IE for simple harmonic motions and arbitrary small motions starting from rest at a certain time are obtained. In the latter case, the theory of generalized functions is used to derive the appropriate integral equation, by incorporating the associated initial conditions, and by highlighting properties of the aerodynamic kernel such as causality. The relationship between the aerodynamic kernels in the time and frequency domains is established. The problem analyzed is useful in the evaluation of the structural response of flight vehicles as well as in the active control problem of aeroelastic response. ESA

N86-30635# Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Goettingen (West Germany). Inst. fuer Aeroelasticity.

THEORETICAL FLUTTER INVESTIGATIONS ON A PLANE CASCADE IN INCOMPRESSIBLE FLOW c08

V. Carstens *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 169-179 (For primary document see N86-30627 22-01)

Avail: NTIS HC A99/MF E03

An analysis which predicts the aeroelastic behavior of a plane cascade in incompressible flow is presented. The unsteady aerodynamic forces and moments acting on the blades are calculated by the method of surface layers. In the general case of bending and/or torsional modes, this method is based on the simultaneous solution of two linear integral equations of the second kind which contain the interaction of steady and unsteady blade loading as well as the influence of all other specific cascade parameters. The solution of the flutter equations for a two degree of freedom model is discussed on the basis of a given cascade configuration. ESA

N86-30636# Technische Univ., Brunswick (West Germany). Inst. fuer Stroemungsmechanik.

APPLICATION OF UNSTEADY WING COLLOCATION METHODS TO CASCADES IN SUBSONIC FLOW c02

A. Klose and B. Laschka *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 180-186 (For primary document see N86-30627 22-01)

Avail: NTIS HC A99/MF E03

A method to calculate the pressure distribution and unsteady forces on the blades of a flat plate cascade in subsonic flow during harmonic oscillation is presented. A collocation method as used in lifting surface theories for single airfoils was adapted to solve the cascade equation. Pressure distribution and aerodynamic forces for several values of stagger, reduced frequency, space-to-chord ratio, Mach number and interblade phase angle were calculated. The results were compared to published data. Significant differences are discovered. ESA

N86-30637# Northwestern Polytechnical Univ., Xian (China).

A NUMERICAL ANALYSIS FOR VERTICAL GUST FIELD INDUCED BY GUST GENERATOR c08

Yongnian Yang and Jianpei Wang *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 187-193 (For primary document see N86-30627 22-01)

Avail: NTIS HC A99/MF E03

A method for calculating vertical gust field induced by a gust generator, which consists of a group of oscillating vanes, based on subsonic unsteady lifting surface theory is presented. When the geometry of the gust generator, oscillating frequency and amplitude, and Mach number are given, the unsteady downwash field can be determined. In the calculation, the interference among the vanes is considered. Through numerical calculation, the characteristics of the vertical gust field induced by one, two, or three vanes with various reduced frequencies and Mach numbers are investigated. The influence of the gust generator on the characteristics of the vertical gust field are discussed, and conclusions for gust wind tunnel design are outlined. ESA

N86-30638*# California Univ., Berkeley. Dept. of Mechanical, Aerospace and Nuclear Enginee Ring.

A NEW LOOK AT ARBITRARY MOTION UNSTEADY AERODYNAMICS AND ITS APPLICATION TO ROTARY-WING AEROELASTICITY c02

Peretz P. Friedmann *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 194-210 (For primary document see N86-30627 22-01)

(Grant NAG2-209)

Avail: NTIS HC A99/MF E03 CSCL 01B

Research on arbitrary motion unsteady aerodynamics, emphasizing applications to rotary wing aeroelastic problems, is reviewed. Generalization of Greenberg's theory and its application to hingeless rotor aeroelastic stability; a technique for formulating finite state approximations to unsteady aerodynamic theories, suitable for fixed and rotary-wing applications, and its application to generalize Loewy's theory; comparison of fixed wing and rotary wing indicial response functions; influence of arbitrary motion aerodynamics, as represented by dynamic inflow on a helicopter in ground resonance; and comparison of dynamic inflow with arbitrary motion unsteady airfoil aerodynamics are covered. ESA

N86-30639# Shenyang Aircraft Corp. (China).
EXPERIMENTAL TRANSONIC PRESSURE DISTRIBUTIONS OF A FLEXIBLE WING-AILERON MODEL AND COMPARISONS WITH RESULTS OF SEVERAL THEORETICAL METHODS c02
De Guan, Weixing Liu, Zhiquan Gao, and Yuxin Zhang *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 211-218 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Analytical methods for the prediction of transonic load distribution due to large aileron deflection angle on a flexible wing were investigated. A 60 deg delta wing model with representative stiffness level and deflected aileron was tested in a high speed wind tunnel, and pressure distributions were measured. Second order transonic small disturbance theory, linearized aerodynamic theory, and an empirical method based on rigid model pressure distributions were used to calculate the load distribution. The empirical method seems more powerful. ESA

N86-30640# Northwestern Polytechnical Univ., Xian (China).
CALCULATION OF THE LOAD DISTRIBUTION, AERODYNAMIC DERIVATIVES AND DYNAMIC CHARACTERISTICS OF QUASI-STATIC ELASTIC AIRCRAFT c02
Qiangang Liu, Changlin Wu, Zheng Jian, and Kai Wu *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 219-228 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

A numerical method for predicting the aerodynamic characteristics of quasi-static elastic aircraft is presented. The method can be used to evaluate the load distribution, control surface efficiency, aerodynamic derivatives and dynamic properties at subsonic speed. The aerodynamic calculations are based on the Green's function method. In structure deformation calculations, the free-structure influence coefficient method is used to evaluate the deformation of the elastic aircraft in free flight. The calculations are carried out for a large elastic aircraft. Results on load distribution, elevator efficiency, longitudinal aerodynamic derivatives, frequency responses to elevator input, and other dynamic properties are compared with those of the same aircraft where the elastic effect is not considered. ESA

N86-30641# Israel Aircraft Industries Ltd., Ben-Gurion Airport.
STATIC AEROELASTIC ANALYSIS USING AIRCRAFT VIBRATION MODES c39
Z. Sheena and M. Karpel *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 229-232 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

A method for the calculation of the airload distribution and aeroelastic effectiveness parameters of a flexible aircraft from the distribution of a rigid one, using its vibration modes, is presented. The method uses modal data of the model in the form of a limited number of low frequency mode shapes and their associated generalized stiffnesses. The mathematical operations are done on the generalized matrices of the model which have a small number of degrees of freedom. The method can calculate the static aeroelastic properties of a free-free aircraft using its elastic, inertial, and aerodynamic properties. The method is suitable for making parametric analyses involving changes in the stiffness of the structure and the aerodynamics of the model. Numerical examples are given and the convergence with the number of modes taken into account is discussed. ESA

N86-30642# Air Force Wright Aeronautical Labs., Wright-Patterson AFB, Ohio. Flight Dynamics Lab.
A REVIEW OF AEROELASTIC RESEARCH AT THE FLIGHT DYNAMICS LABORATORY c08
T. M. Harris, T. E. Noll, T. J. Hertz, and W. A. Sotomayer *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 233-243 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Research on aeroservoelasticity, adaptive flutter suppression, the effects of stores carriage on body freedom flutter, and three dimensional transonic unsteady aerodynamics is discussed. Aeroservoelasticity studies involve research to develop tools for aeroelastic analyses of aircraft when active feedback control systems are taken into account. Adaptive flutter suppression for aircraft carrying external stores is evaluated by wind tunnel tests. Subsonic wind tunnel tests were performed to evaluate the effect of store location, mass, and inertia on aeroelastic stability. ESA

N86-30643# Fairchild Republic Div., Farmingdale, N. Y.
AEROELASTIC WIND TUNNEL SIMILARITY THEORY FOR ANISOTROPIC AIRCRAFT WINGS c08
Gabriel A. Oyibo *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 257-264 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

A theory outlining a simplified approach for aeroelastically simulating anisotropic aircraft wings is presented. An examination of the fundamental aeroelastic equations of motion for anisotropic aircraft wings, with the help of affine transformations, reveals that a unified simulation theory, which reduces to the existing theory in the isotropic limit can be formulated. It is discovered that the necessary condition for preserving the Strouhal number (reduced frequency) between the real aircraft wing and its wind tunnel model is by preserving the generalized forms of the similarity parameters suggested by Theodorsen and Garrick as well as new parameters. The additional similarity parameters reflect directional and coupling stiffness properties of anisotropic materials in a given aerospace structure. The results reduce to those for aircraft wings fabricated of isotropic materials if these new parameters are set equal to zero. ESA

FLUTTER CALCULATION BY A NEW PROGRAM c08
Valter J. E. Stark *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 276-285 Sponsored by Swedish Defence Administration and Saab Scania A.B. (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

A flutter and response program based on general equations of motion is described. The equations are solved by Laplace transformation and by reducing the inversion integral to a sum of the residues at the poles at the zeros of the determinant. The resulting nonlinear eingenvalue problem, i.e., the problem of finding the zeros, is solved by the Newton-Raphson formula with numerical methods for calculation of the determinant and the principle of the argument for finding initial approximations. The program permits choice of different kinds of analytic functions in the linear approximation that is employed for approximating the aerodynamic transfer functions. Equations representing control laws of a flutter suppression system can be included. ESA

EXPERIENCE WITH AEROELASTIC ANALYSIS OF A SINGLE ENGINE TURBO TRAINER USING FINITE ELEMENT METHODS c39
M. J. Reinicke, A. S. Turi (Omega G.m.b.H., Immenstaad West

Germany), and A. Vollan *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 286-296 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

The PC-9 trainer aircraft dynamic analysis concept, based on a theoretical approach relying upon results of extensive ground vibration tests conducted on the similar structure of the PC-7, is outlined. The mathematical model shows good agreement with test results. Flight flutter tests verify the calculated aeroelastic stability. The program dealing with modal variation of mass, stiffness and damping allows changes on superelement level. Hence, the size of the residual structure can be further reduced and the CPU time cut down accordingly. ESA

FINITE STATE MODELLING OF AEROELASTIC SYSTEMS FOR ACTIVE CONTROL APPLICATIONS: A GENERAL THEORY c63
Ranjan Vepa *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 309-319 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

The theory of modeling aeroelastic systems by finite state models is discussed. The models are classified as autonomous finite state models, time varying system models, and differential delay system models. It is shown that control law synthesis for active control can be performed using the differential delay model, which does not contribute to any additional states and is valid for the closed and open loop cases. However, control law implementation requires that the states used for feedback be measured directly or estimated from measurements which are linear combinations of system states. Direct measurements of all feedback states is probably not practical so that sensor output data processing is required. Two alternatives are the statistical Kalman-Bucy filter with error dynamics governed by the statistics of the measurements noise, and a state estimator with error dynamics selected arbitrarily. ESA

NLR EXPERIENCE IN THE APPLICATION OF ACTIVE FLUTTER SUPPRESSION AND GUST LOAD ALLEVIATION, APPLIED TO A WIND TUNNEL MODEL c08
P. A. vanGelder *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 320-329 Sponsored by Netherlands Agency for Aerospace Programs and NLR (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Control laws for flutter suppression and gust load alleviation systems were developed and tested using an aeroelastic model in a subsonic wind tunnel with the capability to simulate discrete or random gusts. Flutter suppression up to the maximum wind tunnel speed (1.4 m/sec) is achieved, while the gust load alleviation system reduces the wing root bending moment by 25% at 0.9 m/sec for simulated gusts with a Dryden spectrum. ESA

N86-30650# Royal Aircraft Establishment, Farnborough (England).
THE DESIGN AND WIND TUNNEL DEMONSTRATION OF AN ACTIVE CONTROL SYSTEM FOR GUST LOAD ALLEVIATION AND FLUTTER SUPPRESSION c08
I. W. Kaynes, C. W. Skingle, and J. C. Copley *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 330-347 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Wind tunnel tests on a flexible model with an active control system are described. A flutter suppression control law was designed and tested. It is shown that flutter suppression is achieved in the presence of gusts. The mathematical model of the aircraft includes descriptions of the whole aircraft motion and the flexible aircraft deformations. Physically realistic modifications were made to the mathematical model to enhance the agreement between predictions and the measured loads and responses. Physical understanding of the active controls is facilitated by an interactive control system design package. The predicted and measured performance of the control laws are presented. ESA

N86-30651# Northwestern Polytechnical Univ., Xian (China).
CONTROL LAW SYNTHESIS FOR GUST LOAD ALLEVIATION USING LINEAR QUADRATIC GAUSSIAN THEORY c08
Jin Chang *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 362-367 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

A method of using linear quadratic Gaussian synthesis in the design of multiloop gust alleviation for a flexible aircraft is presented. To obtain an aeroelastic sytem with a finite-order state form matrix equation, the aerodynamic influence coefficients are approximated by a rational function of s. A technique to minimize the number of augmented states is presented. For all the coefficient matrices, a matrix least squares formula is established. The fitting accuracy of this methods is better than other methods. ESA

N86-30652*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
STIFFNESS CONTROL OF LARGE SPACE STRUCTURES c18
Jay-Chung Chen and James L. Fanson *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 368-373 Sponsored by NASA (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03 CSCL 01B

A method of using internal force producing dual element/actuators for vibration suppression of large space structures is proposed. The technique is applied to a vibrating string and to a low order system. Response feedback control for the vibrating string and selected modal control are used for achieving the modal damping. The actuators may be electrically powered and are suitable for structures with extremely low rigidity. ESA

N86-30653# Dornier-Werke G.m.b.H., Friedrichshafen (West Germany).
ASPECTS OF ACTIVE ISOLATION AS APPLIED TO A SATELLITE STRUCTURE WITH SHAPE PRECISION PAYLOAD c18
W. Charon *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 374-380 (For primary document see N86-30627 22-01)
(Contract ESTEC-5326/83-NL-PB(SC))
Avail: NTIS HC A99/MF E03

Active vibration control of flexible spacecraft is discussed. The satellite structure is divided into two rigid modules: the shape precision payload and a vibrating equipment module containing the attitude sensors and the attitude actuators. The two modules are connected by six spring-force actuator devices considered together to determine the isolation control forces. These connections transmit the low-frequency attitude control to the precision payload but attenuate the higher-frequency disturbances whose

shape and magnitude are unknown to the isolation control system. ESA

THE APPLICATION OF PRACTICAL OPTIMIZATION TECHNIQUES IN THE PRELIMINARY STRUCTURAL DESIGN OF A FORWARD-SWEPT WING **c05**
Edwin Lerner *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 381-392 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

The application of optimization technology in design studies that preceded the full development of the Grumman X-29, forward swept wing, demonstrator aircraft is outlined. Finite-element resizing methods were developed to satisfy optimality criteria for strength and divergence-velocity constraints. Application of the methods in an initial feasibility study of a variable sweep wing and in a more detailed, fixed wing design study are described. The usefulness of the methodology at various stages of design in demonstrated by tracing the process that led to the selection of an efficient cover-laminate configuration. ESA

N86-30655# Cranfield Inst. of Tech. Bedford (England). Coll. of Aeronautics.
STRUCTURAL OPTIMIZATION PROGRAMS AND METHODS **c05**
A. J. Morris *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 393-406 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Minimum weight design algorithms used in computer aided aircraft design are reviewed. Applications to carbon fiber composite wings, aircraft flaps, fuselages, and an automobile seat are illustrated. ESA

N86-30656# Dornier-Werke G.m.b.H., Friedrichshafen (West Germany).
VARIATION OF ANISOTROPIC BEHAVIOR IN STRUCTURAL OPTIMIZATION **c05**
G. Hornung, D. W. Mathias, and H. Roehrle *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 407-414 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Use of the gradient method to optimize carbon fiber reinforced composite airframe design is described. The optimization process consists of two major parts. The first part of the calculation is done to select the fiber orientations for a given structure under a given load. In the second part this preoptimized configuration is improved by varying the thicknesses of the layers, leading to the optimum design. This design having preoptimized compounds is compared with a corresponding quasiisotropic structure and a design having four fixed fiber directions but different thicknesses of the layers. The preoptimized design is shown to be best adapted to the load bearing requirements of the structure. ESA

N86-30657# Purdue Univ., West Lafayette, Ind. School of Aeronautics and Astronautics.
TAILORING METHODOLOGY FOR AEROELASTIC STABILITY AND LATERAL CONTROL ENHANCEMENT **c08**
Terrance A. Weisshaar *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 415-425 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Uses of aeroelastic tailoring to enhance aircraft structural design for dynamic response are discussed. The incorporation of directional stiffness into a design may alter drastically the mode shapes and frequencies of lifting surface. This alteration affects dynamic aeroelastic interactions between modal forces as well as the modal forces themselves. Tailoring to increase flutter speed generally produces a degradation of the classical divergence speed. As a result, the freedom of the wing to move as a rigid body in concert with the fuselage may render the aircraft susceptible to an attitude instability called body-freedom flutter. Thus, aeroelastic tailoring may lead to aeroelastic behavior characteristics not unlike those of swept forward wings. Tailoring may improve controllability at reduced cost. It may provide increased effectiveness of active control by creating a harmonious control/structure environment. ESA

N86-30658# Dornier-Werke G.m.b.H., Friedrichshafen (West Germany).
STRUCTURAL OPTIMIZATION WITH CONSTRAINTS IN DYNAMICS **c18**
Horst J. Baier *In* DGLR The 2nd International Symposium on Elasticity and Structural Dynamics 1985 p 426-433 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Application of mathematical programming for spacecraft optimum structural design, especially weight minimization under static constraints is discussed. Since optimization under dynamic response in general leads to highly nonconvex problems, special care has to be taken for considering local optima. Whatever solution strategy is applied, availability of derivatives of the response is highly desirable. The control force approach is an interesting alternative to the classical mathematical optimization approaches. Since it usually leads to linear problems it is very efficient and circumvents problems related with nonconvexity. Examples to outline the findings are given. ESA

N86-30659# Fairchild Republic Div., Farmingdale, N. Y.
ANISOTROPIC WING AEROELASTIC THEORIES WITH WARPING EFFECTS **c02**
Gabriel A. Oyibo and Julian H. Berman *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 434-440 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

The influence of warping (spanwise axial constraints on wing twist) on anisotropic wing aeroelastic oscillations is investigated using a similarity rule approach. Results show that a high aspect ratio anisotropic wing could behave aeroelastically like a low aspect ratio wing and vice-versa. Similarity parameters derived in the analysis expose conditions for which this might happen. The analysis also indicates that the parameter that is currently used in determining when warping is important (or when not to use the St Venant's torsion theory) is inaccurate for anisotropic wings. The correct parameter is presented. ESA

RECENT RESULTS ON THE WEIGHT MINIMIZATION OF PANELS WITH A FLUTTER SPEED CONSTRAINT **c05**
L. Librescu and L. Beiner *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 441-450 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Weight minimization of flat and curved panels exposed to a supersonic flow and subjected to a flutter speed constraint is described. The analysis encompasses axisymmetric circular cylindrical shells and rectangular orthotropic flat panels. Optimal control in a single variable and of distributed parameter systems is used in deriving the optimality equations. In order to ensure that the flutter speed of the optimal panel coincides with the constrained one, a flutter instability condition is employed. Galerkin's technique is used for solving the optimality equations and the influence of orthotropicity ratio, in-plane loads, aspect ratio, and boundary conditions on the optimal thickness distribution is determined. For the case of pure transverse shear panels, an aeroelastic paradox similar to the membrane paradox is revealed. The cases of 1-D type panels and isotropic 2-D panels are also considered. ESA

EFFECTS OF ANISOTROPIC DESIGN ON THE STATIC AEROELASTICITY OF A SWEPT WING
Matthias Piening *In* DGLR The 2nd International Symposium on

Aeroelasticity and Structural Dynamics 1985 p 451-456 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

A simple structural idealization is adopted to model an arbitrary swept anisotropic wing of moderate to high aspect ratio. The related differential equations are solved for the deformations and internal forces by multiple shooting. The divergence speed is calculated by searching the lowest eingenvalue of the structural matrix formed from the transfer matrices of the wing sections and the according boundary conditions. Parametric evaluations are performed. ESA

N86-30662# Messerschmitt-Boelkow-Blohm G.m.b.H., Munich (West Germany).
AEROELASTIC PROBLEMS AND STRUCTURAL DESIGN OF A TAILLESS CARBON FIBER COMPOSITE (CFC) SAILPLANE **c05**
J. Schweiger, O. Sensburg, and H. J. Berns (Technische Univ., Brunswick, West Germany) *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 457-468 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Severe instability at low speed in a 1/3 scale model of a 15 m sailplane was studied. Flutter calculations using data from a ground resonance test show that coupling of the rigid body short period mode with the first elastic mode causes the phemomenon. The wing was redesigned with the optimization programs FASTOP and TSO to find optimum fiber orientations and stiffness distributions for aeroelastic and strength requirements. By applying these computer codes the flutter speed is increased to an acceptable level with small modifications of the wing root geometry, a new design of the main spar, and by using a high modulus fiber type. With a small weight penalty compared to the initial design the flutter speed can be doubled. ESA

SIMULATION OF AIRCRAFT TAXI TESTING ON THE AGILE SHAKER TEST FACILITY **c09**
Raymond Freymann and William P. Johnson (Air Force Wright Aeronautical Labs., Wright-Patterson AFB, Ohio) *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 468-476 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Use of the Aircraft Ground Induced Loads Excitation test facility, an array of three independent shakers which allows laboratory simulation of an aircraft taxiing on rough surfaces, in the dynamic qualification process and for verification of the mathematical structural model of an aircraft is described. Experimental determination of the elastomechanical characteristics of aircraft landing gears and tires is outlined. ESA

N86-30664# Liege Univ. (Belgium).
DYNAMIC ANALYSIS OF STRUCTURES WITH FLEXIBLE ROTORS **c07**
M. Geradin and N. Kill *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 477-485 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Analytical tools for the dynamic structural analysis of machines with rotating parts such as aircraft engines are described. The finite element analysis is used for discretization, and the rotating parts are described using a 3-D formalism which includes in the kinetic energy expression the gyroscopic effects induced by the local changes of angular velocity produced by the deformation. The implementation of the formalism is specialized to the modeling of flexible rotors made of shafts and disks typical of modern aircraft engines. The effectiveness of the component mode synthesis method to reduce the size of the system of equations is demonstrated in the case of systems made of rotating and fixed parts. Critical speed and stability analyses and unbalance response calculations are performed by a sweeping procedure. The concepts are applied to the dynamic analysis of a high by-pass ratio aircraft engine. ESA

STRUCTURAL DYNAMIC ASPECTS OF ROTOR NODAL ISOLATION **c05**
J. Stoppel *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 486-494 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

An Antiresonance Isolation System (ARIS) for helicopters is described. In the passive nodal isolation system, the antiresonant frequency is tuned to the main rotor passage frequency to prevent the transmission of the oscillatory hub forces and moments to the fuselage. Analysis demonstrates that the nodal rotor isolation system may be strongly influenced by the structural dynamics of the helicopter. Due to the numerous eingenvalues the antiresonant frequency of the isolation system may be compensated by an adjacent natural frequency. In this case the desired isolating effect disappears. The complexity of the three dimensional structure aggravates the understanding and prediction of vibration system. For the BK 117 helicopter with MBB-ARIS, the structural optimization is demonstrated using finite element methods. ESA

ANALYTICAL FINITE ELEMENTS **c39**
Peter H. Kulla *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 495-503 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Continuous element techniques for analyzing linear dynamic systems are outlined, and their efficient use of computer power is described. Systems can be condensed without loss of accuracy. It is not necessary to choose the coordinates to be eliminated in such a way that the error introduced by static reduction schemes is minimized. This gives the freedom to eliminate systematically all inner coordinates of a (sub-) structure and to describe a system in the coordinates of the boundary points only. This feature is highly desirable if two or more structures are considered substructures and are assembled to a higher level system. For reasons of flexibility this procedure has to work repeatedly at different system levels. The approach is only feasible if every substructure (including the final one) is a selfcontained module. ESA

N86-30667# Israel Inst. of Tech., Haifa. Dept. of Aeronautical Engineering.
INFLUENCE OF AXIAL FORCE ON RANDOM VIBRATION RESPONSE OF A STRUCTURE **c39**
Isaac Elishakoff *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 504-511 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Random vibration of a beam simply supported at its ends, including the effect of a deterministic axial loading is studied. The beam is excited by a random transverse load represented by a space and time wise ideal white noise. A closed-form solution is obtained for the displacement space-time correlation function at zero time lag. It is shown that as the axial load approaches the Euler buckling level, the random displacement response increases indefinitely. For axial loads below this level, the obtained expressions permit direct evaluation of probabilistic characteristics of the response. ESA

N86-30668# Dornier-Werke G.m.b.H., Friedrichshafen (West Germany).
DETERMINATION OF BOTH COMPLEX CHARACTERISTIC STRUCTURAL VALUES AND NORMAL MODE PARAMETERS FROM HARMONIC EXCITATION NEAR RESONANCE **c39**
J. Artmann *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 512-522 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

A method of performing system identification on damped elastomechanical structures is proposed. It applies a complex transformation to the usual generalized dynamic equation of motion, giving the possibility to use arbitrary complex response modes to set up the equation of motion. Using harmonic excitation, such response modes can be produced easily and quickly in a conventional vibration test, because no adjustment to natural frequencies or force vectors is necessary. As a consequence of transforming the generalized equation of motion, complex structural system parameters are created, being the elements of two complex matrices which are neither diagonal nor symmetric. However, simple mathematical relations can be derived to compute the elements of these matrices. Any dynamic structural problem, e.g., the flutter problem, can be solved without further knowledge of the usual normal mode parameters. ESA

MODAL PARAMETERS ESTIMATION FROM DRIVEN-BASE TESTS **c18**
S. Draisey, F. R. Vigneron (Department of Communications, Ottawa, Ontario), Y. Soucy, and J.-G. Beliveau (Sherbrooke Univ., Quebec) *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 546-552 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

The theory for a modal method of extraction of modal parameters from uniaxial driven base tests is outlined. With accelerometer data from the driven base and points on the structure, modal frequencies, damping factors, mode shapes, and the product of modal momentum times normalization constant can be determined. The results of a structure tested in driven base random and sine are presented. The structure tested represented a configuration typical of communications satellite in stowed configuration. The driven base results are compared with those obtained from a fixed base single point random survey. Comparison shows that the method is accurate and practical. ESA

N86-30673# London Univ. (England). Dept. of Aeronautical Engineering.
DETERMINATION OF FORCE DISTRIBUTIONS IN MULTI-POINT RESONANCE TESTING USING VARIOUS DIRECT METHODS **c39**
K. Alexiou and J. R. Wright *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 553-564 Sponsored by UK Ministry of Defence (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Direct methods, which use the measured receptance matrix between several measurement and force positions, are applied to simulated six degree of freedom data with two closely spaced modes. An alternative to Asher's (1958) method, based on an eigenvalue solution followed by an eigenvector interpolation, is shown to improve the determination of the number of effective modes (and hence exciters needed) and also of the required force distribution. A similar eigenvalue method based on the characteristic phase lag theory proposed by Traill-Nash (1958) is also studied and, apart from an apparent sensitivity to noise which needs further consideration, seems to be an improvement on both approaches to Asher's method. ESA

N86-30674# Franche-Comte Univ., Besancon (France). Lab. de Mecanique Appliquee.
EIGENSOLUTION IDENTIFICATION OF NON SELF-ADJOINT MECHANICAL STRUCTURES **c39**
Qiang Zhang and Lallement Gerard *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 565-570 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

An identification method of left hand side and right hand side eigenvectors for non self-adjoint structures which have to be modelled by nonsymmetric state matrices is proposed. The method is based on the results of modal identifications successively performed on the initial structure and the same structure with additional masses. It gives good results for two simple laboratory structures. ESA

COMPARISON OF SOME TIME DOMAIN METHODS FOR STRUCTURAL SYSTEM IDENTIFICATION **c39**
J. E. Cooper and J. R. Wright *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 595-604 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Time domain parameter identification methods based on the difference equation model relating sampled response and excitation are considered. The least squares, instrumental variables, and correlation fit methods are described and applied to one and two mode simulated data in the presence of input or measurement noise with various noise-to-signal ratios. Test results are compared statistically to examine the scatter on damping results and whether they are biased. The correlation fit method is seen to be the most suitable for development. ESA

DETERMINATION OF NATURAL VIBRATION PROPERTIES OF A WING WITH WINGLET BY EXPERIMENTAL MODE SYNTHESIS TECHNIQUE **c05**
S. N. Gu, W. J. You, and J. S. Jiang *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 605-611 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Nine lowest natural frequencies and their corresponding natural modes of a wing model with winglet were determined using electric measurement and laser time-averaged holographic interferometry supplemented by sand contours. Three-dimensional quantitative analysis and orthogonalization of the three lowest natural modes of wing with winglet are carried out. Modal synthesis is used to get lower ordered natural frequencies and modes of the wing model with winglet, by using the six lowest orthogonalized modes of the wing and three lowest orthogonalized modes of the winglet. Calculated results of natural frequencies and modes of the wing with winglet and its wing by finite element method agree quite well with experimental data. ESA

RAPID VIBRATION MODE ANALYSIS OF AIRCRAFT WITH EXTERNAL STORES **c05**
M. Karpel *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 612-616 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

A method for coupling the vibration modes of a central structure to additional substructures is presented. A set of low frequency natural modes, including rigid body modes, represents the central structure. These modes are obtained by a mathematical model loaded with a set of fictitious masses at the connection to the substructures degrees of freedom. The substructures are represented by their mass properties, vibration modes with clamped boundary conditions and free-free rigid body modes. The connection of each substructure to the central structure is statically determinate. The method is applied for vibration analysis of aircraft with external stores. The coupled aircraft + stores dynamic properties may be efficiently used for flutter analysis. Comparison with vibration modes obtained by a direct (full-size) eigensolution shows very accurate coupling results with low order eigensolutions. ESA

ANALYSIS-TEST CORRELATION OF DYNAMIC MATHEMATICAL MODELS **c18**
B. Caesar *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 617-624 (For primary document see N86-30627 22-01)
(Contract ESTEC-5597/83/NL-PB(SC))
Avail: NTIS HC A99/MF E03

The reasons for correlation of test and analysis results as well as for the mathematical model update process are summarized and related to the total development flow of a spacecraft structure. Correlation methods such as modal scale factor, assurance criteria, and enhanced frequency response functions are reviewed. Berman's method symmetry, and orthogonality conditions with a least squares deviation of updated against previous mass and stiffness matrices is improved by taking into account rigid body masses. The algorithmic approaches are discussed leading to linear least squares problems under equality constraints. Applications of this method based on simulated test data and recommendations for improvements in related modal tests are given. ESA

LOW FREQUENCY DESIGN VERIFICATION OF LARGE SPACECRAFT STRUCTURES **c18**
E. Erben and K. Eckhardt *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 672-682 Sponsored by INTELSAT and ESTEC (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Multiaxis vibration system (MAVIS) testing of large spacecraft structures is described. Specified acceleration time histories are compared with the realized time histories measured at base point of test item. For the uniaxial excitation compliance is very good. During two axis excitation the differences between specified and measured input time histories are significant. The deviations are associated with strong frequency and amplitude changes in the transient motion. However, these results are achieved with an open loop control configuration of test facility and improvements are possible. Simulations of antenna reactions suggest deviations between applied and specified forces but resulting acceleration responses on different structure points are comparable with results achieved in test with complete S/C (same order of maximum acceleration peaks). INFLUENCE OF NONLINEAR SPACECRAFT COMPONENTS ON DYNAMIC LAUNCH AND IN-ORBIT RESPONSE **c18**
I. Kolsch and H. Baier *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 689-696 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

Analytical and experimental investigations of a BAPTA-yoke-solar array system are presented. Harmonic balance, Fourier expansion, and perturbation methods were selected, since the system could be reasonably reduced to a springs-masses model with measured nonlinear force-displacement curves. The investigation shows significant dependency on maximum response frequencies and amplifications (pseudo damping) with (harmonic and random) input levels. Due to a shift in the point of operation in the nonlinear stiffness relation caused by quasistatic acceleration, the response data also significantly depend on the applied g-level, leading to considerable shifts in maximum response frequencies and loss of symmetries. For in-orbit dynamics with low static and dynamic input levels, maximum response frequencies could be relatively low. ESA

SIGNIFICANCE AND RELIABILITY OF DYNAMIC ANALYSIS METHODS DEMONSTRATED IN THE INSTRUMENT POINTING SYSTEM PROJECT **c16**
E. Hilbrandt and J. Kroeker *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics 1985 p 697-699 (For primary document see N86-30627 22-01)
Avail: NTIS HC A99/MF E03

The dynamic load analysis of the Instrument Pointing System to obtain design loads which can be used for detailed stress analysis and for the proof of safe life or fail safe design is summarized. Such design loads may be defined as a reduced load set enveloping the actual flight loads. The flight loads themselves are not used for stress analysis because of their great variety and because they are extremely dependent upon the design itself. It is the aim of the design loads to provide a flight load envelope which can remain unchanged throughout the entire course of the design process. As the transient load-contribution represents the greatest severity for the primary structure the determination of the design loads needs only to be demonstrated for the transient loads. ESA

THE METHOD OF COMPLEX CHARACTERISTICS FOR DESIGN OF TRANSONIC BLADE SECTIONS Research and Development Report
M. R. Bledsoe Jun. 1986 203 p
(Grant NAG2-345; Contract DE-AC02-76ER-03077; Grant NSF DMS-83-20430)
(NASA-CR-176978; NAS 1.26:176978; DOE/ER-03077/273) Avail: NTIS HC A10/MF A01 CSCL 01A

A variety of computational methods were developed to obtain shockless or near shockless flow past two-dimensional airfoils. The approach used was the method of complex characteristics, which determines smooth solutions to the transonic flow equations based on an input speed distribution. General results from fluid mechanics are presented. An account of the method of complex characteristics is given including a description of the particular spaces and coordinates, conformal transformations, and numerical procedures that are used. The operation of the computer program COMPRES is presented along with examples of blade sections designed with the code. A user manual is included with a glossary to provide additional information which may be helpful. The computer program in Fortran, including numerous comment cards is listed. B.G.

AERODYNAMIC DRAG REDUCTION TESTS ON A BOX-SHAPED VEHICLE Final Report
Randall Lee Peterson and Doral R. Sandlin Aug. 1981 53 p
(Contract NCC4-1)
(NASA-CR-176982; NAS 1.26:176982) Avail: NTIS HC A04/MF A01 CSCL 01A

The intent of the present experiment is to define a near optimum value of drag coefficient for a high volume type of vehicle through the use of a boattail, on a vehicle already having rounded front corners and an underbody seal, or fairing. The results of these tests will constitute a baseline for later follow-on studies to evaluate candidate methods of obtaining afterbody drag coefficients approaching the boattail values, but without resorting to such impractical afterbody extensions. The current modifications to the box-shaped vehicle consisted of a full and truncated boattail in conjunction with the faired and sealed underbody. Drag results from these configurations are compared with corresponding wind tunnel results of a 1/10 scale model. Test velocities ranged up to 96.6 km/h (60 mph) and the corresponding Reynolds numbers ranged up to 1.3 x 10 to the 7th power based on the vehicles length which includes the boattail. A simple coast-down technique was used to define drag. Author

AERODYNAMIC DATA BANKS FOR CLARK-Y, NACA 4-DIGIT AND NACA 16-SERIES AIRFOIL FAMILIES Final Report
K. D. Korkan, J. Camba, III, and P. M. Morris Jan. 1986 272 p
(Contract NAS3-272)
(NASa-CR-176883; NAS 1.26:176883) Avail: NTIS HC A12/MF A01 CSCL 01A

With the renewed interest in propellers as means of obtaining thrust and fuel efficiency in addition to the increased utilization of the computer, a significant amount of progress was made in the development of theoretical models to predict the performance of propeller systems. Inherent in the majority of the theoretical performance models to date is the need for airfoil data banks which provide lift, drag, and moment coefficient values as a function of Mach number, angle-of-attack, maximum thickness to chord ratio, and Reynolds number. Realizing the need for such data, a study was initiated to provide airfoil data banks for three commonly used airfoil families in propeller design and analysis. The families chosen consisted of the Clark-Y, NACA 16 series, and NACA 4 digit series airfoils. The various component of each computer code, the source of the data used to create the airfoil data bank, the limitations of each data bank, program listing, and a sample case with its associated input-output are described. Each airfoil data bank computer code was written to be used on the Amdahl Computer system, which is IBM compatible and uses Fortran. Author

COMPARISON OF EXPERIMENTAL SURFACE PRESSURES WITH THEORETICAL PREDICTIONS ON TWIN TWO-DIMENSIONAL CONVERGENT-DIVERGENT NOZZLES
John R. Carlson, Odis C. Pendergraft, Jr., and James R. Burley, II Aug. 1986 31 p Presented at the AIAA 4th Applied Aerodynamics Conference, San Diego, Calif., 9-11 Jun. 1986
(NASA-TM-87757; NAS 1.15:87757; AIAA-86-1803-CP) Avail: NTIS HC A03/MF A01 CSCL 01A

A three-dimensional subsonic aerodynamic panel code (VSAERO) was used to predict the effects of upper and lower external nozzle flap geometry on the external afterbody/nozzle pressure coefficient distributions and external nozzle drag of nonaxisymmetric convergent-divergent exhaust nozzles having parallel external sidewalls installed on a generic twin-engine high performance aircraft model. Nozzle static pressure coefficient distributions along the upper and lower surfaces near the model centerline and near the outer edges (corner) of the two surfaces were calculated, and nozzle drag was predicted using these surface pressure distributions. A comparison between the theoretical predictions and experimental wind tunnel data is made to evaluate the utility of the code in calculating the flow about these types of non-axisymmetric afterbody configurations. For free-stream Mach numbers of 0.60 and 0.90, the conditions where the flows were attached on the boattails yielded the best comparison between the theoretical predictions and the experimental data. For the Boattail terminal angles of greater than 15 deg., the experimental data for M = 0.60 and 0.90 indicated areas of separated flow, so the theoretical predictions failed to match the experimental data. Even though calculations of regions of separated flows are within the capabilities of the theoretical method, acceptable solutions were not obtained. Author

NUMERICAL STUDIES OF POROUS AIRFOILS IN TRANSONIC FLOW Ph.D. Thesis. Final Report, 1 Jun. 1985 - 31 Aug. 1986
Chuen-Yen Chow 1986 114 p
(Contract NCC2-355)
(NASA-CR-179655; NAS 1.26:179655) Avail: NTIS HC A06/MF A01 CSCL 01A

A numerical tool is constructed to examine the effects of a porous surface on transonic airfoil performance and to help understand the flow structure of passive shockwave/boundary layer interactions. The porous region is located near the shock with a cavity underneath it. This study is composed of two parts. Solved in the first part, with an inviscid-flow approach, is the transonic full-potential equation associated with transpiration boundary conditions which are obtained from porosity modeling. The numerical results indicate that a porous airfoil has a wave drag lower than that of a solid airfoil. The observed lambda-shock structure in the wind-tunnel testing can be predicted. Furthermore, the lift could be increased with an appropriate porosity distribution. In the second part of this work, the modified version of either an interactive boundary layer (IBL) algorithm or a thin-layer Navier-Stokes (TLNS) algorithm is used to study the outer flow, while a stream-function formulation is used to model the inner flow in the shallow cavity. The coupling procedure at the porous surface is based on Darcy's law and the assumption of a constant total pressure in the cavity. In addition, a modified Baldwin-Lomax turbulence model is used to describe the transpired turbulent boundary layer in the TLNS approach, while the Cebeci turbulence model is used in the IBL approach. According to the present analysis, a porous surface can reduce the wave drag appreciably, but can also increase the viscous losses. As has been observed experimentally, the numerical results indicate that the total drag is reduced at higher Mach numbers and increased at lower Mach numbers when the angles of attack are small. Furthermore, the streamline pattern of passive shock/boundary layer interaction are revealed. Author

AERODYNAMICS OF ENGINE-AIRFRAME INTERACTION Annual Progress Report, 1 Oct. 1985 - 30 Sep. 1986
D. A. Caughey 30 Aug. 1986 29 p
(Grant NAG2-373)
(NASA-CR-179657; NAS 1.26:179657) Avail: NTIS HC A03/MF A01 CSCL 01A

The report describes progress in research directed towards the efficient solution of the inviscid Euler and Reynolds-averaged Navier-Stokes equations for transonic flows through engine inlets, and past complete aircraft configurations, with emphasis on the flowfields in the vicinity of engine inlets. The research focusses upon the development of solution-adaptive grid procedures for these problems, and the development of multi-grid algorithms in conjunction with both, implicit and explicit time-stepping schemes for the solution of three-dimensional problems. The work includes further development of mesh systems suitable for inlet and wing-fuselage-inlet geometries using a variational approach. Work during this reporting period concentrated upon two-dimensional problems, and has been in two general areas: (1) the development of solution-adaptive procedures to cluster the grid cells in regions of high (truncation) error;and (2) the development of a multigrid scheme for solution of the two-dimensional Euler equations using a diagonalized alternating direction implicit (ADI) smoothing algorithm. M.G.

PAN AIR APPLICATION TO THE F-106B
Farhad Ghaffari Aug. 1986 60 p
(Contract NAS1-17919)
(NASA-CR-178165; NAS 1.26:178165) Avail: NTIS HC A04/MF A01 CSCL 01A

The PAN AIR computer code was employed in the present study to investigate the aerodynamic effects of the various geometrical changes and flow conditions on a configuration similar to the F-106B half-airplane tested in the Langley 30x60-foot wind tunnel. The various geometries studied included two forebodies (original and shortened), two inlet flow conditions (open and closed) two vortex flap situations (off and on). The attached flow theoretical solutions were obtained for Mach number of 0.08 and angle of attack of 8 deg., 10 deg., 12 deg., and 14 deg. In general this investigation revealed that the shortening of the forebody or closing of the inlet produced only a small change in the overall aerodynamic coefficients of the basic F-106B configuration throughout the examined angles of attack. However, closing the inlet of the configuration resulted in a slightly higher drag level at low angles of attack. Furthermore, at and above 10 deg. angle of attack, it was shown that the presence of the vortex flap causes an increase in the total lift and drag. Also, these theoretical results showed the expected reduction in longitudinal stability level with addition of the vortex flap to the basic F-106B configuration. Author

PRESSURE TEST OF THREE ELLIPTIC MISSILE BODY CONFIGURATIONS Final Report, 15 - 17 Sep. 1985
Marvin E. Sellers (Calspan Field Services, Inc., Arnold AFS, Tenn.) Oct. 1985 39 p Prepared in cooperation with Calspan Corp., Arnold
(AD-A166552; AEDC-TSR-85-P19) Avail: NTIS HC A03/MF A01 CSCL 20/4

A wind tunnel test was conducted to obtain the surface pressure distributions of three elliptic missile body configurations. The test was performed at nominal Mach numbers from 0.4 to 1.3 at a constant nominal free-stream unit Reynolds number of 2.4 million per ft. The angle-of-attack range was -4 to 20 deg at sideslip angles of -4, 0, and 4 deg. Only sample tabulations of the test results are included in the report. GRA

AIR-ON DEMONSTRATION OF THE AEDC PWT TUNNEL 16T CAPTIVE TRAJECTORY SUPPORT SYSTEM Final Report, 21 Jul. - 26 Jul. 1985
Louisa L. Arendt (Calspan Field Services, Inc. Arnold AFS, Tenn.) Sep. 1985 68 p Prepared in cooperation with Calspan Field Service
(AD-A166888; AEDC-TSR-85-P17) Avail: NTIS HC A04/MF A01 CSCL 20/4

An air-on demonstration of the Captive Trajectory Support (CTS) system was conducted in the AEDC Propulsion Wind Tunnel (16T). The test objectives were: (1) to demonstrate the structural integrity of the CTS system; (2) to demonstrate the ability of the CTS system to satisfactorily obtain grid and trajectory generation data for a typical store model in free stream and relative to a simulated (flat plate) aircraft in a dynamic wind tunnel environment; (3) to obtain a Mach number calibration for the Tunnel 16T Cart 2 (Multipurpose Cart) with the CTS system installed. The 1/4-scale Maximum Volume Bomb (MVB) was used to represent a typical store. Data were obtained at free-stream numbers from 0.6 to 1.6 and at various compressor ratios. GRA

A SEMI-ANALYTICAL APPROACH TO THE INTEGRAL EQUATION (IN TERMS OF THE ACCELERATION POTENTIAL) FOR THE LINEARIZED SUBSONIC, OSCILLATORY FLOW OVER AN AIRFOIL Final Report, Mar. 1983 - Sep. 1985
Karl G. Guderley Mar. 1986 183 p
(Contract F33615-83-K-3207)
(AD-A167313; UDR-TR-85-91; AFWAL-TR-85-3119) Avail: NTIS HC A09/MF A01 CSCL 20/4

The kernel of the integral equation which describes the oscillatory flow over an airfoil has severe singularities. The mathematical questions that arise here are usually circumvented by the use of physical concepts; one concentrates, for instance, the pressures into lines, or even points and evaluates the upwash field by means of the Biot Savart law. The upwash so expressed in terms of the parameters that describe the pressure field is then matched at selected control points with the upwash prescribed by the boundary conditions. One thus obtains a finite linear system of equations for the parameters describing the pressure distribution. The selection of control points contains an element of uncertainty, because the upwash field generated by a pressure distribution of the assumed character is highly singular. In the present approach the pressure distribution is again represented

by a finite number of parameters and one ultimately solves a linear system of equations. But for the pressure a much smoother representation is chosen (piece-wise linear continuous functions). The upwash is then computed directly from the integral equation. Matching between the upwash distribution due to the unknown pressure distribution and that given by the boundary conditions is carried out in the average over upwash areas. Such a procedure requires repeated integrations. GRA

SEAT EXPERIMENT RESULTS OF FULL-SCALE TRANSPORT AIRCRAFT CONTROLLED IMPACT DEMONSTRATION Final Report, Jan. - Jul. 1985
Mark R. Cannon and Richard E. Zimmermann (RMS Technologies, Inc., Trevose, Pa.) Jul. 1986 248 p
(Contract DTFA03-81-C-00040)
(DOT/FAA/CT-85/25; TR-85413) Avail: NTIS HC A11/MF A01

The results of the Federal Aviation Administration (FAA) seat experiments tested in the joint FAA/NASA Controlled Impact Demonstration (CID) are described. Twenty-three seats were placed on the test aircraft. Thirteen seats were modifications of existing transport seats which were designed structurally to improve their crashworthiness. The remaining experiments were unmodified standard seats which included seven light and heavy-weight forward-facing seats, two aft-facing seats, and one flight attendant seat. Three additional seat experiments were placed onboard the test aircraft: two by NASA, and one by a private contractor. Onboard instrumentation was placed at specific locations to obtain data pertaining to airframe structural loads and seat/occupant response. Accelerometers were attached to the airframe and floor structure, the seat experiments, and the anthropomorphic dummies occupying the seats. The data base resulting from the test was intended for

validating crash prediction models and occupant/seat dynamic simulation models. Author

AIRCRAFT ACCIDENT REPORT: PROVINCETOWN, BOSTON AIRLINES FLIGHT 1039, EMBRAER BANDEIRANTE, EMB-110P1, N96PB, JACKSONVILLE, FLORIDA, DECEMBER 6, 1984
24 Jun. 1986 100 p
(PB86-910405; NTSB/AAR-86/04) Avail: NTIS HC A05/MF A01

Provincetown-Boston Airlines Flight 1039, an Embraer Bandeirante, was cleared from the Jacksonville International Airport, Jacksonville, Florida, to Tampa, Florida at 1805 eastern standard time on December 6, 1985, in visual flight conditions. There were 11 passengers and 2 crewmembers aboard the scheduled domestic passenger flight operating under 14 CFR 135. At 1812, flight 1039 was cleared for takeoff, and, at 1813, while over the departure end of the runway and climbing, the crew acknowledged a frequency change Thirty seconds later, about 1814, the airplane was seen in a steep descent near the extended centerline of the runway. Flight 1039 struck the ground 7,800 feet beyond the departure end of runway 31 and 85 feet to the northeast (right) of the extended runway centerline in an inverted nose down attitude, after which it caught fire and burned. The airplane was demolished, and all 13 persons aboard were killed. Before ground impact, the horizontal stabilizer, including bulkhead No. 36, had separated from the fuselage. Both elevators and elevator tips, the tail cone assembly, and the aft portion of the ventral fin also had separated in flight. Author

AIRCRAFT TRANSPARENCY TESTING: ARTIFICIAL BIRDS Final Report, 1 Jul. 1984 - 1 May 1985
C. J. Welsh and Vincent Centonze Apr. 1986 18 p Prepared in cooperation with AEDC
(AD-A166832; AEDC-TR-86-2) Avail: NTIS HC A02/MF A01 CSCL 14/2

An analysis was made concerning the use of artificial birds in bird impact testing of aircraft transparencies. Results of this analysis, including impact measurements at a nominal velocity of 500 fps, indicated that the use of artificial birds for impact testing at these conditions is impractical. This follows from the importance and difficulty of simulating the shear strength characteristics of real birds in transparency impacts. GRA

DEVELOPMENT OF AIRBORNE ELECTRIC FIELD AND LIGHTNING DETECTION INSTRUMENTATION FOR AVIATION SAFETY Final Report
Ralph Markson 20 Apr. 1986 30 p
(Contract N00014-85-C-0707)
(AD-A167342) Avail: NTIS HC A03/MF A01 CSCL 01/4

The objectives of Phase I were to investigate the use of simple corona current instrumentation on aircraft to measure thunderstorm electric fields and to conduct a feasibility study of a single station aircraft lightning interferometer to detect the occurrence and position of lightning. Both of these techniques have the common purpose of providing warning to aircraft crews when they are approaching potentially hazardous clouds and thunderstorms. The electric field measurement has the advantage of detecting electrified clouds which may not be producing lightning flashes but are nevertheless dangerous because an aircraft can trigger lightning; however this is a relatively short range system (on the order of 10 to 20 miles). The interferometer, which responds to RF pulses from lightning, has the advantage of long range detection (more than 100 miles) and can map the the position of lightning flashes in a manner similar to the way radar maps areas of rain. Thus the systems complement each other. GRA

THE BLACK BOX. SILENCE IS SILVER, SPEECH IS GOLDEN [DE ZWARTE DOOS. ZWIJGEN IS ZILVER, SPREKEN IS GOUD]
A. W. Pol Jul. 1984 151 p Partly in DUTCH and ENGLISH
(ESA-86-97394) Avail: NTIS HC A08/MF A01

Requirements, design and development, and feasibility aspects of Flight Data Recorders (FDR) and Cockpit Voice Recorders (CVR) are treated. Examples of existing systems (e.g., the U.S. Navy Universal Locator Airborne Data Systems, and the solid-state FDR) are given. Installation of FDR/CVR combined crash recorders in Westland Lynx helicopters is discussed. Aircraft accident relevant information, necessary adaptions of the helicopter, and feasibility were investigated. As the present aircraft indicating instruments often contain information after accidents it is concluded that installation of only a CVR is a feasible solution. However, future aircraft instruments (e.g., digital computers, and displays) might necessitate FDRs also. ESA

AVIATION WEATHER HAZARDS: FAA (FEDERAL AVIATION ADMINISTRATION) SYSTEM FOR DISSEMINATING SEVERE WEATHER WARNINGS TO PILOTS Briefing Report
Apr. 1986 34 p
(PB86-195070; GAO/RCED-86-152BR; B-222882) Avail: NTIS HC A03/MF A01 CSCL 01B

Controllers at the nation's busiest airports sometimes do not have time to disseminate weather information to pilots. In addition, when weather information is given, it may not be given as soon as possible because controllers are too busy performing their primary duty of separating aircraft. FAA's procedure for communicating weather warnings by having controllers read them over their radio frequencies is too slow to avoid potential hazards, and some pilots may not receive any warning because of radio frequency changes. On-airport weather detection systems (LLWAS and ASR) do not provide controllers adequate detection or information about potentially hazardous weather because the radar cannot detect storm intensities, and the wind shear system cannot reliably detect the most dangerous form of wind shear, microbursts. INTERACTION BETWEEN EMP (ELECTROMAGNETIC PULSE), LIGHTNING AND STATIC ELECTRICITY WITH AIRCRAFT AND MISSILE AVIONICS SYSTEMS
1986 144 p Presented at a Lecture Series, Ankara, Turkey, 29-30 May 1986, Oberpfaffenhofen, West Germany, 2-3 Jun. 1986, and The Hague, The Netherlands, 5-6 Jun. 1986; sponsored by Avionics Panel and the Consultant and Exchange Programme of AGARD
(AGARD-LS-144; ISBN92-835-1528-5) Avail: NTIS HC A07/MF A01

Interactions between transient electromagnetic waves with aircraft and missile avionics systems are described. Transient electromagnetic waves include electromagnetic pulses (EMP) from nuclear explosions, lightning, and static electricity. Interactions are introduced by coupling of EMP and lightning induced currents and voltages with avionics components. Shielding against these interactions is discussed with respect to induced currents and voltages from EMP and lightning, and induced voltages from static charging effects. Several examples of interactions, coupling, shielding, and measurement techniques are presented. This Lecture Series, sponsored by the Avionics Panel of AGARD, has been implemented by the Consultant and Exchange Program of AGARD. Author

CRASHWORTHINESS OF AIRFRAMES
1986 34 p Presented at the 61st Meeting of the Structures and Materials Panel of AGARD in Oberammergau, West Germany, 8-13 Sep. 1985
(AGARD-R-737; ISBN92-835-1525-0) Avail: NTIS

HC A03/MF A01

At its 61st Meeting the AGARD Structures and Materials Panel heard three papers as a preliminary to setting up a Sub-Committee on this topic; this publication contains these papers. They survey a range of theoretical and experimental aspects of crashworthiness relating to metallic structures. For structures made of these materials theoretical methods are becoming useful design tools, but much further development is required before composite structures can be satisfactorily handled. There is a very great need for a data base of reliable experimental information (including accident data bases) on both metallic and composite structures. Author

SPECIFICATION OF A NAVSTAR GLOBAL POSITIONING SYSTEM (GPS) RECEIVER FOR A DIFFERENTIAL GPS GROUND SYSTEM

Daryl L. McCall and Richard N. Turner Oct. 1984 18 p

(Grant NAG2-231)

(NASA-CR-177073; NAS 1.26:177073; TM-H-4) Avail: NTIS HC A02/MF A01 CSCL 17G

One step towards the successful completion of a functional ground unit for the Differential Global Positioning System (DGPS) will be in choosing a currently available GPS receiver that will accurately measure the propagation times of the satellite signals and have the capability to be electrically interfaced with and controlled by a Digital Equipment Corporation (DEC) PDP-11/34A computer. The minimum requirements and characteristics of a NAVSTAR Global Positioning System (GPS) receiver are described. The specific technical specifications addressed include data accuracies and resolutions, receiver interface/external control, enclosure dimensions and mounting requirements, receiver operation, and environmental specifications. COMPREHENSIVE TEST AND EVALUATION OF THE DALMO VICTOR TCAS 2 INDUSTRY PROTOTYPES Final Report, Feb. 1986

Albert Rehmann Feb. 1986 245 p

(FAA/PM-862; FAA/CT-86/2) Avail: NTIS HC A11/MF A01

The test procedure and results of a five-part comprehensive evaluation of two prototype minimum Traffic Alert and Collision Avoidance System (TCAS) II units are described. The five parts include: (1) hardware and software verification, (2) cockpit display and operational procedure verification. (3) pilot and inflight observer training, (4) TCAS II demonstration to the aviation community, and (5) readiness for airworthiness certification testing. Overall, the minimum TCAS II prototype has matured into an acceptable test-bed for the 8-month inservice evaluation in a commercial airliner. System reliability has improved and pilot acceptance was generally good. It is expected that minimum TCAS II will provide a valuable service to airline pilots. Author

THE DMA/GPS EARTH ORIENTATION PREDICTION SERVICE Final Report

John A. Bangert 28 Apr. 1986 16 p

(AD-A166830) Avail: NTIS HC A02/MF A01 CSCL 08/5

Since mid-1984, the Defense Mapping Agency (DMA) has been computing predictions of pole position (x and y) and time difference (UT1-UTC = delta UT) to support the NAVSTAR/GPS orbit determination process. These predictions are based upon the derived Earth orientation parameters published in the U.S. Naval Observatory's Earth Orientation Bulletin (Series 7) and are obtained by fitting these data to a set of models specified in the DMA/GPS Interface Control Document. This paper presents a review of the models and processes by which the Earth orientation predictions are computed at DMA. The results of a study to assess the accuracy of these predictions are also presented. Finally, several proposed methods for improving the prediction accuracies without altering the basic models are discussed and evaluated. GRA

OPERATIONS CONCEPT FOR THE TCCC (TOWER CONTROL COMPUTER COMPLEX) MAN-MACHINE INTERFACE Final Report

H. L. Ammerman, E. S. Becker, L. J. Bergen, D. K. Davies, and E. E. Inman 28 Mar. 1986 771 p

(Contract DTFA01-85-Y-01034)

(AD-A166899; FAA/AP-86/02) Avail: NTIS HC A99/MF A02 CSCL 17/7

Operations Concept for the TCCC Man-Machine Interface analyzes the tower Air Traffic Controller's job in the Tower Control Computer Complex (TCCC) environment. It considers the operations in today's towers and the automated capabilities planned for the TCCC, to reach an understanding of the Controller's job after TCCC implementation. Three separate positions are analyzed: Local Control, Ground Control, and Clearance Delivery/Flight Data. Analysis results include composition graphs and narratives showing the logical flow through the sub-activities of the three positions; task analysis, presenting the tasks of each position; task characterizations, including information requirements, cognitive/sensory attributes, and performance criteria associated with each task; and a top-level dialogue description summarizing the interaction between controller and TCCC. Traceability between tasks and system level specification requirements is also provided. GRA

A.I.-BASED REAL-TIME SUPPORT FOR HIGH PERFORMANCE AIRCRAFT OPERATIONS Report, 15 May 1984 - 14 May 1985
Jacques Vidal, J. 1985 52 p
(Grant NAG2-302)
(NASA-CR-176906; NAS 1.26:176906) Avail: NTIS HC A04/MF A01 CSCL 01C

Artificial intelligence (AI) based software and hardware concepts are applied to the handling system malfunctions during flight tests. A representation of malfunction procedure logic using Boolean normal forms are presented. The representation facilitates the automation of malfunction procedures and provides easy testing for the embedded rules. It also forms a potential basis for a parallel implementation in logic hardware. The extraction of logic control rules, from dynamic simulation and their adaptive revision after partial failure are examined. It uses a simplified 2-dimensional aircraft model with a controller that adaptively extracts control rules for directional thrust that satisfies a navigational goal without exceeding pre-established position and velocity limits. Failure recovery (rule adjusting) is examined after partial actuator failure. While this experiment was performed with primitive aircraft and mission models, it illustrates an important paradigm and provided complexity extrapolations for the proposed extraction of expertise from simulation, as discussed. The use of relaxation and inexact reasoning in expert systems was also investigated. Author

IMPACT DATA FROM A TRANSPORT AIRCRAFT DURING A CONTROLLED IMPACT DEMONSTRATION
Edwin L. Fasanella (PRC Kentron, Inc., Hampton, Va.), Emilio Alfaro-Bou, and Robert J. Hayduk Sep. 1986 88 p
(NASA-TP-2589; L-16125; NAS 1.60:2589) Avail: NTIS HC A05/MF A01 CSCL 01B

On December 1, 1984, the FAA and NASA conducted a remotely piloted air-to-ground crash test of a Boeing 720 transport aircraft instrumented to measure crash loads of the structure and the anthropomorphic dummy passengers. Over 330 time histories of accelerations and loads collected during the Full-Scale Transport Controlled Impact Demonstration (CID) for the 1-sec period after initial impact are presented. Although a symmetric 1 deg. nose-up attitude with a 17 ft/sec sink rate was planned, the plane was yawed and rolled 13 deg. at initial (left-wing) impact. The first fuselage impact occurred near the nose wheel well with the nose pitched down 2.5 deg. Peak normal (vertical) floor accelerations were highest in the cockpit and forward cabin near the nose wheel well and were approximately 14G. The remaining cabin floor received normal acceleration peaks of 7G or less. The peak longitudinal floor accelerations showed a similar distribution, with the highest (7G) in the cockpit and forward cabin, decreasing to 4G or less toward the rear. Peak transverse floor accelerations ranged from about 5G in the cockpit to 1G in the aft fuselage. Author

THE PERFORMANCE EVALUATION OF A JET FLAP ON AN ADVANCED SUPERSONIC HARRIER Final Report
Larry Dean Lipera and Doral R. Sandlin Aug. 1984 84 p
(Contract NCC2-238)
(NASA-CR-179653; NAS 1.26:179653) Avail: NTIS HC A05/MF A01 CSCL 01C

The performance concept of a supersonic vertical and short takeoff and landing (V/STOL) fighter, model 279-3, modified to utilize a jet flap was evaluated. Replacing the rear nozzles of the 279-3 with the jet flap favorably alters the pressure distribution over the airfoil and dramatically increases lift. The result is a significant decrease in takeoff distance, an increase in payload, and an improvement in combat performance. To investigate the

benefit in increased payload, the 279-3 and the jet flapped 279-3JF were modeled on the NASA Aircraft Synthesis (ACSYNT) computer code and flown on a 250 feet takeoff distance interdiction mission. The increase in payload weight that the 279-3JF could carry was converted into fuel in one case, and in another, converted to bomb load. When the fuel was increased, the 279-3JF penetrated into enemy territory almost four times the distance of 279-3, and therefore increased mission capability. When the bomb load was increased, the 279-3JF carried 14 bombs the same distance the 279-3 carried four. The increase in mission performance and improvements in turning rates was realized with only a small penalty in increased empty weight. Author

LIQUID HYDROGEN FUELED PASSENGER AIRCRAFT
Yongnian Qian 11 Mar. 1986 11 p Transl. into ENGLISH from Hangkong Zhishi (China), no. 11, Nov. 1984 p 22-23
(AD-A166229; FTD-ID(RS)T-0862-85) Avail: NTIS HC A02/MF A01 CSCL 01/3

The idea that passenger aircraft will eventually use liquid hydrogen fuel is discussed. There is a large reserve of hydrogen and hydrogen poses no danger to the environment. Hydrogen has high calorific value, high specific heat, low density and low temperature. Aircraft will have to have a liquid fuel tank to carry the hydrogen and will have to be partially redesigned. Lockheed and NASA have considered such designs. A problem remains in the planning--the high cost of large extraction of liquid hydrogen. GRA

ELECTROSTATIC HAZARDS OF URETHANE PACKED FUEL TANKS Final Report, Mar. 1977 - Apr. 1978
Thomas C. Hillman, Jon R. Manheim, and George A. Spencer Mar. 1986 95 p
(AD-A166803; AFWAL-TR-82-2022) Avail: NTIS HC A05/MF A01 CSCL 13/12

An experiment investigation has been been carried out to determine the primary factors that have contributed to recent aircraft electrostatically induced ground refueling fire incidents. It was found that the explosion suppression open pore polyurethane fuel tank foams along with the charging characteristics of the JP-4 fuel resulted in charge accumulation and electrostatic spark discharging. The polyurethane foams accumulated charge due to their highly resistive nature (blue, 10 to the 15th power ohm-cm; red, 10 to the 14th power ohm-cm; yellow, to the 14th power ohm-cm; and orange, 10 to the 13th power ohm-cm). The fuel flow rate and velocity entering the tank and impinging on the open pore polyurethane foam directly affected the magnitude of the charge separation which was occurring. The number of refuelings that had taken place also was a critical factor due to its effect on charge accumulation/discharge frequency levels. The last major variable investigated was pro-static (Gulf-178) and conductivity improving (shell ASA-3) fuel additives. The Gulf-178 additive dramatically increased the levels of charge separation and accumulation taking place along with a reversal in the polarity of charge. The Shell ASA-3 fuel additive eliminated the aircraft ground refueling electrostatic discharge hazard decreasing the level of charge accumulation. GRA

THE INFLUENCE OF LARGE-SCALE COMPUTING ON AIRCRAFT STRUCTURAL DESIGN
Apr. 1986 67 p
(AGARD-R-726; ISBN92-835-1522-6) Avail: NTIS HC A04/MF A01

An outcome of the AGARD Working Group on Large Scale Computing was the institution by the Structures and Materials Panel of a Sub-Committee to consider this topic in relation to Aircraft Structural design. The publication contains papers on various aspects of the topic heard by the Sub-Committee plus a summary. These cover likely developments in both soft- and hardware, and their applications to the Design process. This Report was sponsored by the Structures and Materials Panel of AGARD. Author

STORE SEPARATION FLIGHT TESTING
R. J. Arnold, C. S. Epstein, and R. K. Bogue, ed. Apr. 1986 161 p
(AGARD-AG-300-Vol-5; ISBN92-835-1523-4) Avail: NTIS HC A08/MF A01

This volume in the AGARD Flight Test Techniques Series treats stores separation testing from the overall systems standpoint. All aspects of testing are described from the time of identification of a particular aircraft/store requirement through all steps leading to the establishment of a satisfactory employment envelope. Considerable emphasis is placed on the planning and execution of the flight test phase of the stores clearance program, including the definition of a basic structure, and a set of procedures which will maximize the safe and efficient execution of such a program. DESIGN, DEVELOPMENT AND INTEGRATE/INSTALL AN AIRBORNE REMOTE INSTRUMENTATION SYSTEM (AIREYE) Final Report
J. J. Bommarito and L. E. Saylor Aug. 1985 79 p
(Contract DTCG23-80-C-20012)
(AD-A166755; Rept-7921; USCG-D-27-85) Avail: NTIS HC A05/MF A01 CSCL 01/3

A prototype airborne remote instrument system, AIREYE, was developed for the U.S. Coast Guard by Aerojet ElectroSystems Company. This multisensor system permits real-time day/night, all weather detection, mapping and documentation of vessels and pollution at sea. The system was installed aboard a coast Guard Hu-25A Falcon fanjet aircraft and flight tested off the California coast. Surveillance data were obtained from natural oil seeps, known optical and radar targets, routine shipping and targets of opportunity. The AIREYE system consists of a sidelooking radar, infrared/ultraviolet line scanner, active gated television systems, aerial reconnaissance camera and a processor/display recording subsystem with real-time digital image enhancement capability. The system reliably detected and mapped oil seeps and vessel locations for environmental conditions ranging from dense undercast to clear, windspeeds from 0 to greater than 25 knots and from daytime to total darkness. The ability to read a vessel's name and determine deck activity in total darkness was demonstrated. The AIREYE real-time digital enhancement provided detection, recognition and identification of targets of interest when not otherwise possible with unenhanced imagery. Test results demonstrated that the AIREYE system will provide greatly enhanced capability in the U.S. Coast Guard missions of Marine Environmental Protection (MEP), Enforcement of Laws and Treaties and Search and Rescue. AIRBORNE NAVIGATION REMOTE MAP READER EVALUATION Final Report, 1 Sep. 1984 - 30 Sep. 1985
James C. Byrd Mar. 1986 56 p
(AD-A166976; ASD-TR-86-5004) Avail: NTIS HC A04/MF A01 CSCL 01/3

The U.S. Air Force evaluated the Full-Color Remote Map Reader built by Thomson-CSF of France under the Foreign Weapons, Equipment, and Technology Evaluation program. The unit is used in a military aircraft to provide a moving map video display for the aircrew. Map data is contained in a 65-foot roll of 35mm film at 11.4:1 reduction, which allows approximately 550 sq. ft. of aeronautical charts of any standard scale to be stored in one cassette. The unit moves the film with microprocessor-controlled servo motors and performs scanning, rotation and zoom with a microprocessor-controlled flying spot scanner. It obtains navigation data from the aircraft MIL-STD-1553 data bus and presents video on a full-color, shadow-mask cathode ray tube. The evaluation determined that the moving map display is useful in several Air Force missions, and that the French map reader technology is roughly equivalent to devices recently developed in the U.S. Author (GRA)

07 AIRCRAFT PROPULSION AND POWER

UNSTEADY DESIGN-POINT FLOW PHENOMENA IN TRANSONIC COMPRESSORS Final Report
J. B. Gertz and A. H. Epstein Aug. 1986 210 p
(Grant NGL-22-009-383)
(NASA-CR-176879; NAS 1.26:176879) Avail: NTIS HC A10/MF A01 CSCL 21E

High-frequency response probes which had previously been used exclusively in the MIT Blowndown Facility were successfully employed in two conventional steady state axial flow compressor facilities to investigate the unsteady flowfields of highly loaded transonic compressors at design point operation. Laser anemometry measurements taken simultaneously with the high response data were also analyzed. The time averaged high response data of static and total pressure agreed quite well with the conventional steady state instrumentation except for flow angle which showed a large spread in values at all radii regardless of the type of instrumentation used. In addition, the time resolved measurements confirmed earlier test results obtained in the MIT Blowdown Facility for the same compressor. The results of these tests have further revealed that the flowfields of highly loaded transonic compressors are heavily influenced by unsteady flow phenomena. The high response measurements exhibited large variations in the blade to blade flow and in the blade passage flow. The observed unsteadiness in the blade wakes is explained in terms of the rotor blades' shed vorticity in periodic vortex streets. The wakes were modeled as two-dimensional vortex streets with finite size cores. The model fit the data quite well as it was able to reproduce the average wake shape and bi-modal probability density distributions seen in the laser anemometry data. The presence of vortex streets in the blade wakes also explains the large blade to blade fluctuations

seen by the high response probes which is simply due to the intermittent sampling of the vortex street as it is swept past a stationary probe. Author

THERMODYNAMIC EVALUATION OF TRANSONIC COMPRESSOR ROTORS USING THE FINITE VOLUME APPROACH Status Report
Stephen Nicholson and John Moore Aug. 1986 292 p
(Grant NAG3-593)
(NASA-CR-176947; NAS 1.26:176947; JM/86-6) Avail: NTIS HC A13/MF A01 CSCL 21E

A method was developed which calculates two-dimensional, transonic, viscous flow in ducts. The finite volume, time marching formulation is used to obtain steady flow solutions of the Reynolds-averaged form of the Navier Stokes equations. The entire calculation is performed in the physical domain. The method is currently limited to the calculation of attached flows. The features of the current method can be summarized as follows. Control volumes are chosen so that smoothing of flow properties, typically required for stability, is now needed. Different time steps are used in the different governing equations to improve the convergence speed of the viscous calculations. A new pressure interpolation scheme is introduced which improves the shock capturing ability of the method. A multi-volume method for pressure changes in the boundary layer allows calculations which use very long and thin control volumes. A special discretization technique is also used to stabilize these calculations. A special formulation of the energy equation is used to provide improved transient behavior of solutions which use the full energy equation. The method is then compared with a wide variety of test cases. The freestream Mach numbers range from 0.075 to 2.8 in the calculations. Transonic viscous flow in a converging diverging nozzle is calculated with the method; the Mach number upstream of the shock is approximately 1.25. The agreement between the calculated and measured shock strength and total pressure losses is good. Essentially incompressible turbulent boundary layer flow in a adverse pressure gradient is calculated and the computed distribution of mean velocity and shear stress are in good agreement with the measurements. At the other end of the Mach number range, a flat plate turbulent boundary layer with a freestream Mach number of 2.8 is calculated using the full energy equation; the computed total temperature distribution and recovery factor agree well with the measurements when a variable Prandtl number is used through the boundary layer. ROBUST DETECTION, ISOLATION AND ACCOMMODATION FOR SENSOR FAILURES Final Report
Abbas Emami-Naeini, Muhammad M. Akhter, and Stephen M. Rock Jul. 1986 164 p
(Contract NAS3-24079)
(NASA-CR-174825; NAS 1.26:174825; SCT-85-5449) Avail: NTIS HC A08/MF A01 CSCL 21E

The objective is to extend the recent advances in robust control system design of multivariable systems to sensor failure detection, isolation, and accommodation (DIA), and estimator design. This effort provides analysis tools to quantify the trade-off between performance robustness and DIA sensitivity, which are to be used to achieve higher levels of performance robustness for given levels of DIA sensitivity. An innovations-based DIA scheme is used. Estimators, which depend upon a model of the process and process inputs and outputs, are used to generate these innovations. Thresholds used to determine failure detection are computed based on bounds on modeling errors, noise properties, and the class of failures. The applicability of the newly developed tools are demonstrated on a multivariable aircraft turbojet engine example. A new concept call the threshold selector was developed. It represents a significant and innovative tool for the analysis and synthesis of DIA algorithms. The estimators were made robust by introduction of an internal model and by frequency shaping. The internal mode provides asymptotically unbiased filter estimates. The incorporation of frequency shaping of the Linear Quadratic Gaussian cost functional modifies the estimator design to make it suitable for sensor failure DIA. The results are compared with previous studies which used thresholds that were selcted empirically. Comparison of these two techniques on a nonlinear dynamic engine simulation shows improved performance of the new method compared to previous techniques Author

FEASIBILITY STUDY FOR CONVERTIBLE ENGINE TORQUE CONVERTER
Oct. 1985 72 p
(Contract NAS3-24092)
(NASA-CR-175082; NAS 1.26:175082; EDR-12118) Avail: NTIS HC A04/MF A01 CSCL 21E

The feasibility study has shown that a dump/fill type torque converter has excellent potential for the convertible fan/shaft engine. The torque converter space requirement permits internal housing within the normal flow path of a turbofan engine at acceptable engine weight. The unit permits operating the engine in the turboshaft mode by decoupling the fan. To convert to turbofan mode, the torque converter overdrive capability bring the fan speed up to the power turbine speed to permit engagement of a mechanical lockup device when the shaft speed are synchronized. The conversion to turbofan mode can be made without drop of power turbine speed in less than 10 sec. Total thrust delivered to the aircraft by the proprotor, fan, and engine during tansient can be controlled to prevent loss of air speed or altitude. Heat rejection to the oil is low, and additional oil cooling capacity is not required. The turbofan engine aerodynamic design is basically uncompromised by convertibility and allows proper fan design for quiet and efficient cruise operation. Although the results of the feasibility study are exceedingly encouraging, it must be noted that they are based on extrapolation of limited existing data on torque converters. A component test program with three trial torque converter designs and concurrent computer modeling for fluid flow, stress, and dynamics, updated with test results from each unit, is recommended. TIME RESOLVED AND TIME AVERAGED FLOW EVALUATION FOR AN ISOLATED TRANSONIC COMPRESSOR ROTOR Final Report
F. Neuhoff Mar. 1986 61 p
(Contract N00014-84-C-0766)
(AD-A166759; TR-8601) Avail: NTIS HC A04/MF A01 CSCL 20/4

A 0.28-m single stage transonic fan was operated in a rotor only configuration. Overall performance was measured and radial distributions of inlet and outlet velocity were obtained using time-averaging combination temperature-pneumatic probes. These results were compared to the prediction of a finite element computer code (TURBOFEM) prediction. The blade-to-blade velocity and pressure distributions were measured using the Dual Probe Digital Sampling technique (involving two commercial semi-conductor probes of simple design). Data were obtained from hub-to-tip at both near-sonic and at supersonic inlet relative Mach numbers. The rotor losses were derived as blade-to-blade distributions and the shock losses were evaluated as components of the total loss at each radius. Based on the limited data obtained near sonic conditions, a combination of the profile loss model of Koch & Smith and shock loss model of Dunker was found to predict the measured radial loss distribution quite well. Preliminary observations of rotor shock oscillations were also reported. Compressor rotors, Compressor stators, Transonic flow, Turbomachinery flow fields, Transonic loss measurements, and Finite element codes. GRA

JET-ENGINE COMBUSTOR SPECTRAL RADIATION MEASUREMENTS USING FIBEROPTIC INSTRUMENTATION SYSTEM. RADIANT ENERGY POWER SOURCE FOR JET AIRCRAFT Final Report

O. Leonard Doellner Feb. 1986 121 p
(Contract DE-FG01-82CE-15144)
(DE86-007289; DOE/CE-15144/T2) Avail: NTIS
HC A06/MF A01

This report is a summary of spectral radiation measurements made at Williams Air Force Base, Chandler, Arizona on a General Electric J-85-5 engine. The spectral radiation measurements consisted of a complete axial profile down the combustor and are directed toward the application of Radiant Energy Power Source for Jet Aircraft. Radiant Energy Power Source for Jet Aircraft relates to the use of photovoltaic cells to generate the electrical power demands of the aircraft. The photovoltaic cells are mounted inside the casing of the jet engine, are thermally insulated from the normally hot engine casing, and are appropriately cooled. The photovoltaic cells receive their required radiant energy from the combustion flame by holes in the combustion liner. The instrumentation system used to make these measurements employed fiberoptic probes - entering the engine by way of an existing (modified) access plate - to obtain the radiation measurements. Such an instrumentation system has the strong advantage of being able to measure radiation from all the holes running axially down the combustor without making any holes in the plenum/engine casing - as would be necessary if sapphire observation windows were used. LONGITUDINAL STABILITY AND CONTROL DERIVATIVES OBTAINED FROM FLIGHT DATA OF A PA-30 AIRCRAFT Final Report
Dale R. Turley and Doral R. Sandlin Apr. 1981 60 p
(Contract NCC4-1)
(NASA-CR-176999; NAS 1.26:176999) Avail: NTIS
HC A04/MF A01 CSCL 01C

In order to obtain reliable and accurate values of the stability and control derivatives, the Dryden Fligh Research Center (DFRC) developed a technique for extracting the derivatives from flight data. This technique is implemented by a set of FORTRAN computer programs that is based on a modified maximum likelihood estimator that uses the Newton-Raphson algorithm to perform the required minimization of the derivatives. Data was obtained with a PA-30, light twin-engine general aviation aircraft in zero, half, and full flap configuration in level unaccelerated flight with the landing gear retracted. The derivatives were plotted as functions of angle of attack using various graphical arrangements to show variations of wind tunnel and flight determined values at zero flap settings. Also, data was displayed to show the effects of flap deflection and thrust variation on the longitudinal stability derivatives. The angle of attack and angle of sideslip were measured. The dynamic pressure, velocity, and altitude were calculated, using a FORTRAN computer program, from the static and dynamic pressures. The control deflections of the stabilator, ailerons, and rudder also were recorded along with left throttle position, engine rpm, and manifold pressure. B.G.

HC A04/MF A01 CSCL 01C

The flight test results obtained recently (1984) by CALSPAN on pitch-rate flight control systems in the flared landing task, obtained with the Total In-Flight Simulator (TIPS), were analyzed. The analysis approach considered is based on the Optimal Control/Frequency Domain (OC/FD) techniques. These techniques originally stem from an optimal-control approach to perform a Neal-Smith-like analysis on aircraft attitude dynamics, but were extended and used successfully to analyze the flared landing task. B.G.

A SURVEY OF HANDLING QUALITIES CRITERIA AND THEIR APPLICATIONS TO HIGH PERFORMANCE AIRCRAFT Final Report
David L. Peahl, Faysal Kolkailah, and Doral R. Sandlin Jan. 1986 68 p
(Contract NCC2-338)
(NASA-CR-179654; NAS 1.26:179654) Avail: NTIS
HC A04/MF A01 CSCL 01C

Various handling qualities criteria and their application to high performance aircraft including state-of-the-art and highly augmented aircraft were surveyed. Neal-Smith, Bandwidth, Equivalent Systems, and Military Specification 8785 criteria are applied to flight test data from aircraft such as the F-8 Digital Fly-By-Wire, the YF-12, and an Advanced Fighter Aircraft. Backgrounds and example applications of each criteria are given. The results show that the handling qualities criteria investigated can be applied to highly augmented aircraft with fairly good results in most cases; however, since no one method excelled, more than one criteria should be used whenever possible. Equivalent time delays appear to be the most frequent critical factor in determining pilot rating levels of highly augmented aircraft. Author

AIRCRAFT RESPONSE TO TURBULENCE
1985 32 p Presented at the 61st Meeting of the Structures and Materials Panel of AGARD, Oberammergau, West Germany, 8-13 Sep. 1985
(AGARD-R-738; ISBN92-835-0393-7) Avail: NTIS
HC A03/MF A01

In 1985 the Structures and Materials Panel initiated an activity to consider the flight of flexible aircraft in turbulence. As a preliminary to the start of this activity, the Panel heard the two papers included in this report. One of the two papers discusses measurements of time histories of turbulence made by specially equipped aircraft and turbulence event statistics obtained from aircraft in commercial operation. The other paper considers aspects of collection and analysis of flight data, methods of calculating aircraft response and constraints in operation. Author

APPLICATION OF Ada HIGHER ORDER LANGUAGE TO GUIDANCE AND CONTROL
May 1986 106 p Presented at a Lecture Series, Ottawa, Ontario, 20-21 May 1986; London, England, 2-3 Jun. 1986; and Cologne, West Germany, 5-6 Jun. 1986; sponsored by the Guidance and Control Panel and the Consultant and Exchange Programme of AGARD
(AGARD-LS-146; ISBN92-835-1527-7) Avail: NTIS
HC A06/MF A01

The need to reduce escalating software life-cycle costs is the rationale for Ada. Early experience with the language suggests that the promise of increased software productivity can be fulfilled.

However, many problems remain; the need for validated and efficient compilers targeted for computers suitable to the guidance and control application, and software development environments built around Ada, are two among the foremost. This Lecture Series, sponsored by the Guidance and Control Panel of AGARD, has been implemented by the Consultant and Exchange Programme of AGARD. Author

AIRPORT CAPACITY ENHANCEMENT PLAN Final Report, Nov.

1984 - Jan. 1986
1986 172 p
(AD-A166686; DOT-TSC-FAA-86-2; DOT/FAA/CT-86/1) Avail: NTIS HC A08/MF A01 CSCL 05/1

The first edition of the Airport Capacity Enhancement Plan has been developed by the Federal Aviation Administration's newly established Airport Capacity Program Office (ACPO). The plan is intended to increase the capacity and efficient utilization of airports, and to alleviate current and projected aircraft operating delays in the nation's airport system without compromises to safety or to the environment. This plan delineates the goals of the capacity enhancement program. It identifies the concerns of air system users and defines the extent and causes of the capacity and delay problem as it currently exists and is projected for the next decade. The allocation of responsibility for capacity and delay activities within the FAA is discussed. The 53 planned and ongoing FAA projects intended to reduce capacity-related problems are identified. The plan provides descriptions of each of these projects, significant milestones, estimates of their capacity-related benefits, and references to more detailed descriptions of each project. GRA

A STUDY OF FACTORS RELATED TO COMMERCIAL SPACE PLATFORM SERVICES
S. Neil Hosenball Aug. 1986 254 p
(Grant NAGw-884)
(NASA-CR-176881; NAS 1.26:176881) Avail: NTIS HC A12/MF A01 CSCL 22A

In the past four years, the issue of the commercial development of space has come to the forefront of the U. S. national space policy. Though the Administration, Congress and NASA have all shown strong support for encouraging the private sector to become more actively involved in the commercial utilization of space, the question remains whether they must do more to foster the creation and development of a viable U. S. commercial space industry. Marketing aspects, insurance and risk loss, tax related factors, space transportation, termination liability, institutional barriers, and procurement laws and regulations are discussed. B.G.

PRELIMINARY STUDY OF THE USE OF LAPLACE AND MOMENTUM VECTORS IN THE DETERMINATION OF INTERPLANETARY LOW THRUST TRAJECTORIES
M. C. Bartholomew-Biggs, L. C. W. Dixon, and S. E. Hersom Jul. 1985 32 p
(Contract ESA-6134/84-D-JS(SC))
(ESA-CR(P)-2173; ESA-86-97219) Avail: NTIS HC A03/MF A01

The feedback and Pontryagin approaches to the optimization of low thrust trajectories using the momentum and Laplace vectors are considered. The feedback algorithm runs into numerical difficulties at the final point and at intermediary points where the efficiencies are low. These difficulties can be avoided by using the switching function, but impractical trajectories can still occur and hence cause trouble if this happens inside an optimization routine. The algorithm readily produces final orbits which are correct except for the argument of perihelion, but is of no practical use to proceed beyond this point. In the Pontryagin approach, the use of the first order approximation, in which the adjoint variables are assumed constant, is justified. This enables optimization to be undertaken with a much shorter computer time per iteration and with little degradation in performance. ESA

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE)

Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.

GROUND LAUNCHED MISSILE CONTROLLED RATE DECELERATOR Patent

Harold G. Brittain and Charles B. Brantley, inventors (to Navy) Issued 11 Mar. 1986 8 p
(AD-D012212; US-Patent-4,575,026; US-Patent-Appl-SN-626958; US-Patent-Class-244-63) Avail: NTIS US Patent and Trademark Office CSCL 16/1

This patent discloses a deceleration sled to decelerate and safely contain a launched test missile. The sled has crushable honeycomb which absorbs the initial impact of the missile as the sled accelerates along a track to the same speed as the missile. As the deceleration sled is pushed down the rails, forming shoes on both sides of the sled engage flat metal plates. The forming shoes roll the flat plates into a U shape. The energy required to roll these plates can be changed by varying their thickness. GRA

Explosive driven flux compression generators (FCG's) are single-shot devices that convert part of the energy of high explosives into electromagnetic energy. Some classes of these generators have served quite well as railgun power sources. In this paper and the following paper we describe strip and helical type FCG's, both of which are in use in the Los Alamos railgun program. Advantages and disadvantages these generators have for railgun power supplies will be discussed, together with experimental results obtained and some of the diagnostics we have found particularly useful. DOE

LAUNCHER BARREL FOR THE LETHALITY TEST SYSTEM RAILGUN
J. R. Sims, K. E. Christensen, C. E. Cummings, and N. C. Calkins 1986 5 p Presented at the 3rd Symposium on Electromagnetic Launch Technology, Austin, Tex., 20-24 Apr. 1986
(Contract W-7405-eng-36)
(DE86-008739; LA-UR-86-942; CONF-8604147-7) Avail: NTIS HC A02/MF A01

A reusable plasma armature railgun barrel design is described. This barrel was designed and is being fabricated at the Los Alamos National Laboratory for use in a kinetic energy lethality test system. The performance goals for this barrel are (1) that it be able to withstand the loads generated when accelerating a 30-g projectile to a velocity of 15 km/s without sustaining permanent damage, (2) that it have multiple shot capability, and (3) that it be capable of being repaired and/or modified. The barrel consists of a multipiece modular core contained in an outer structural shell. The core assembly, composed of rails and insulators, is accessible for repair or replacement. The outer structural shell is designed to allow access to the core and is used to preload the core compressively. The barrel design incorporates various features that will allow the use of stronger and stiffer materials such as structural ceramics and reinforced coppers as they become available. DOE

RAILGUN CONDUCTOR HEATING FROM MULTIPLE CURRENT PULSES
J. F. Kerrisk 1986 7 p Presented at the 3rd Symposium on Electromagnetic Launch Technology, Austin, Tex., 20 Apr. 1986
(Contract W-7405-eng-36)
(DE86-008724; LA-UR-86-815; CONF-8604147-4) Avail: NTIS HC A02/MF A01

A numerical technique for solving current- and thermal-diffusion problems in railgun conductors has been used to study joule heating in rails that are subject to multiple current pulses. Copper rails that are 25 mm high by the 12.5 mm wide with a 20-mm-square bore and a current pulse with 1-MA peak current and 1-ms pulse width at half maximum were assumed. This combination of parameters is sufficient to accelerate an 80-g projectile to 2-3 km/s with which current pulse. Three parameters were varied in the analysis: the repetition rate or current pulse frequency (3.3 to 100 Hz), the coolant heat-transfer coefficient (5 x 10(4) and 5 x 10(5) W/m(2) .K), and the coolant channel distribution in the rail. Detailed results are used to illustrate the acceptability or unacceptability of particular combinations of these parameters for operation at steady state. An uncooled rail was not acceptable for steady-state operation. Repetition rates of about 30 Hz were acceptable with the higher coolant heat-transfer coefficient and the best coolant-channel distribution; this included cooling the rail exterior surface. DOE

A MECHANICAL PROPERTY AND STRESS CORROSION EVALUATION OF VIM-ESR-VAR WORK STRENGTHENED AND DIRECT DOUBLE AGED INCONEL 718 BAR MATERIAL
J. W. Montano Sep. 1986 37 p
(NASA-TP-2634; NAS 1.60:2634) Avail: NTIS HC A03/MF A01 CSCL 11F

Presented are the mechanical properties and the stress corrosion resistance of triple melted [vacuum arc remelted (VIM), electro-slag remelted (ESR), and vacuum arc remelted (VAR)], solution treated, work strengthened and direct double aged Inconel 718 alloy bars [4.00 in. (10.16) and 5.75 in. (14.60 cm) diameter]. Tensile, charpy v-notched impact, and compact tension specimens were tested at ambient temperature in both the longitudinal and

transverse directions. Longitudinal tensile and yield strengths in excess of 220 ksi (1516.85 MPa) and 200 ksi (1378.00 MPa) respectively, were realized at ambient temperature. Additional charpy impact and compact tension tests were performed at -100 F (-73 C). Longitudinal charpy impact strength equalled or exceeded 12.0 ft-lbs (16.3 Joules) at ambient and at -100 F(-73 C) while longitudinal compact (LC) tension fracture toughness strength remained above 79 ksi (86.80 MPa) at ambient and at -100 F(-73 C) temperatures. No failures occurred in the longitudinal or transverse tensile specimens stressed to 75 and 100 percent of their respective yield strengths and exposed to a salt fog environment for 180 days. Tensile tests performed after the stress corrosion test indicated no mechanical property degradation.

LOW-THRUST ROCKET TRAJECTORIES
P. W. Keaton Jan. 1986 21 p
(Contract W-7405-eng-36)
(DE86-007573; LA-10625-MS) Avail: NTIS HC A02/MF A01

The development of low-thrust propulsion systems to complement chemical propulsion systems will greatly enhance the evolution of future space programs. Two advantages of low-thrust rockets are stressed. First, in a strong gravitational field, such as occurs near the Earth, freighter missions with low-thrust engines require one-tenth as much propellant as do chemical engines. Second, in a weak gravitational field, such as occurs in the region between Venus and Mars, low-thrust rockets are faster than chemical rockets with comparable propellant mass. The purpose here is to address the physics of low-thrust trajectories and to interpret the results with two simple models. Analytic analyses are used where possible - otherwise, the results of numerical calculations are presented in graphs.

OBSERVATIONS OF THE EARTH'S MAGNETIC FIELD FROM THE SHUTTLE: USING THE SPARTAN CARRIER AS A MAGNETIC SURVEY TOOL
W. J. Webster, Jr. Jul. 1986 39 p
(NASA-TM-87796; NAS 1.15:87796) Avail: NTIS HC A03/MF A01 CSCL 08B

The shuttle-deployed and recovered Spartan shows promise as an inexpensive and simple support module for potential field measurements. The results of a preliminary engineering study on the applications of the Spartan carrier to magnetic measurements shows: (1) Extension of the mission duration to as long as 7 days is feasible but requires more reconfiguration of the internal systems; (2) On-board recording of Global Positioning System signals will provide position determination with an accuracy consistent with the most severe requirements; and (3) Making Spartan a magnetically clean spacecraft is straight forward but requires labor-intensive modifications to both the data and power systems. As a magnetic survey tool, Spartan would allow surveys at regularly spaced intervals and could make quick-reaction surveys at times of instability in the secular variation.

LATERAL STABILITY AND CONTROL DERIVATIVES EXTRACTED FROM FIVE EARLY FLIGHTS OF THE SPACE SHUTTLE COLUMBIA
James R. Schiess Aug. 1986 34 p
(NASA-TM-88994; NAS 1.15:88994) Avail: NTIS HC A03/MF A01 CSCL 22B

Flight data taken from the first five flights (STS-2, 3, 4, 5 and 9) of the Space Transportation System Shuttle Columbia during entry are analyzed to determine the Shuttle lateral aerodynamic characteristics. Maximum likelihood estimation is applied to data derived from accelerometer and rate gyro measurements and trajectory, meteorological and control surface data to estimate lateral-directional stability and control derivatives. The estimated parameters are compared across the five flights and to preflight predicted values.

DIRECTORY OF TRANSDUCER USERS, SEVENTH EDITION
Mar. 1986 72 p Supersedes RCC-100-83

(AD-A167162; RCC-100-86; RCC-100-83) Avail: NTIS HC A04/MF A01 CSCL 09/6

The Directory of Transducer Users is a compilation of knowledgeable transducer personnel at various government activities, aerospace contractors and universities. The Directory has been published to promote the exchange of information between transducer users with common problems. The requirement for the first edition (1973) of this publication was generated at the 7th Transducer Workshop, which was hosted at Albuquerque, N.M., during April 1972 by the Transducer Committee, Telemetry Group, Range Commanders Council. The workshop concluded that a major problem existed in the lack of information-exchange between transducer users. The seventh edition of the Directory of Transducer Users was generated following the 13th Transducer Workshop conducted at Monterey, Cal., in Jun 1985. An index of types of transducers has been included in this edition so that organizations and individuals associated with specific types of transducers can be easily identified. GRA

HYGROTHERMAL CHARACTERISTICS OF ANTENNA MATERIALS
J. W. Atkinson, G. H. Wostenholm, and B. Yates *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 17-24 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Increases in mass resulting from the absorption of water by epoxy resins reinforced with Kevlar 49 and Nomex fibers are reported. The influence of relative humidity over the range 12% to 93% at 23 C was studied, along with the effects of fiber volume fraction and fiber type on the final moisture content of the systems. High volume fraction materials absorb less than low volume fraction materials. Nomex absorbs more moisture than Kevlar. The modified Boltzmann transport model proposed by Carter and Kibler (1978) gives a better description of the behavior than the classical Fickian model proposed by Shen and Springer (1976). Absorption from atmospheres at low humidities appears to be governed by different laws from those operating at intermediate and high humidities. ESA

FATIGUE AND DAMAGE IN FIBRE REINFORCED NYLON c24
W. S. Carswell *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 25-29 Sponsored by UK Dept. of Trade and Industry (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Fatigue tests with a range of mean loads and at two temperatures were carried out on short glass-fiber nylon and short graphite-fiber reinforced nylon. Changes were monitored by noting the peak deflection. Range of deflections and the peak deflection increase, indicating a rotation of the hysteresis loop and creep in the direction of maximum load. The range of deflections at room temperature and at elevated temperature indicates endurance, although there are differences in performance at elevated temperature. The extent of such changes necessary for failure is obscure. ESA

THERMAL RESIDUAL STRESSES IN SYMMETRIC AND UNSYMMETRIC CARBON FIBER REINFORCED PLASTICS: SOME TENTATIVE WAYS OF EVALUATION c39
J. P. Favre *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 31-38 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Effects of thermal stresses which develop during fabrication on the integrity of composites used in spacecraft are discussed. For an unsymmetric material, the result is a modification of the shape. In the simple case of a long and thin cross-ply specimen, residual stresses in the transverse plies can be deduced from reading the curvature. For a plate, the existence of several stable shapes according to the aspect ratio is verified. For the symmetric material, in-situ estimation of residual stress magnitude by X-ray diffraction using a metallic powder embedded between the plies is described. ESA

DYNAMIC MECHANICAL ANALYSIS AS AN AID TO THE CHARACTERIZATION OF COMPOSITE MATERIALS c24
D. H. Bowen, R. Davidson, R. J. Lee, and M. Aguirre *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 39-46 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Dynamic mechanical analysis (DMA) was used to assess the thermal properties of polymeric materials and resin matrix carbon fiber composites. By considering the storage and loss moduli and damping as a function of temperature, information relating to the nature, state of cure, and hysteretic characteristics of the matrix can be obtained. This information assists in the interpretation of the impact strengths and creep resistance of polymers and composites. Examples of the use of DMA in research and development programs with composite materials based on heat resistant thermoplastic (PES, PEI, PEEK) and thermosetting polymers (phenolics, bismaleimides and epoxides) are given. The factors and limitations affecting the quantitative stiffness measurements of orthotropic composite materials by DMA are discussed,

specifically measurements on unidirectional carbon fiber reinforced polyether ether ketone. ESA

THE STRENGTH OF BOLTED JOINTS IN KEVLAR RP **c39**
J. M. Hodgkinson, D. L. deBeer, and F. L. Matthews *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 53-61 Sponsored by ESA (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Failure data for single and multibolt joints in woven Kevlar reinforced epoxy resin are presented. The results are relevant to 6-ply, 0.5 mm thick, symmetrical laminates of different fiber orientation. Bolts used were M4 diameter (d) with standard washers. Lay-up, bolt tensile load, and hence washer pressure, end (e) and width (w) effects were explored in single and double lap joint configurations. Quasi-isotropic lay-ups fail at higher stresses than orthotropic laminates, and, for sufficiently large e/d and w/d ratios, failure is in bearing with no observable edge effects. Multiple bolt tests concerned lines and rows of bolts, the pitch being varied to determine the effects of bolt interaction. These tests were performed on the preferred quasi-isotropic lay-up. ESA

N86-30766# Dornier-Werke G.m.b.H., Friedrichshafen (West Germany).
ORTHOTROPIC PROPERTIES OF LAYERED FIBER COMPOSITES **c24**
G. R. Kress *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 65-70 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

A mathematical method to replace orthotropic and symmetric laminates by a homogeneous material whose mechanical properties are defined in all three spatial directions is presented. A very good agreement between the out-of-plane properties calculated with the method and those obtained using a finite element approach is shown. The values for the in-plane properties are identical to those obtained by the classical lamination theory. ESA

THEORETICAL AND EXPERIMENTAL BEHAVIOR OF CARBON FIBER REINFORCED PLASTICS UNDER MECHANICAL AND THERMAL LOAD **c24**
U. Bieling *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 71-78 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Based on a fiber resin system for aerospace components, the linear and nonlinear stress-strain behavior of CRP laminates is investigated. Theoretical and experimental results correlate very well up to high loads by entering strain-dependent coefficients into the stiffness matrix. Approaches for tracking the initiation of microcracks and crack propagation by acoustic emission and dissipation of energy are presented. By measuring the coefficients of thermal expansion (CTE) of a basic lamina and the equations of classical lamination theory, CTE's of any laminate can be calculated. ESA

ANALYTICAL AND EXPERIMENTAL RESULTS OF ADVANCED COMPOSITE STIFFENED PANELS UNDER COMBINED LOADS **c39**
Giulio Romeo *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 79-86 Sponsored by Italian Ministry of Education (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

A theoretical analysis to design advanced composite hat and blade-stiffened panels under uni and biaxial compression and/or shear is reported. The analysis is based on the buckling equation of the simply-supported orthotropic plate to predict the overall buckling of the panel and the local buckling of each cross-section element, and on the torsional instability theory for the blade-stiffened panels. A computer program to evaluate the minimum-mass optimization of the panels was designed. Tests on graphite/epoxy hat and blade-stiffened panels under uniaxial compression and unstiffened panels under shear were conducted. Adequate correlation between theoretical analysis and experimental results is obtained. ESA

HAND CALCULATION METHOD FOR BUCKLING OF COMPOSITE SHELL STRUCTURES **c39**
R. F. P. vanZelst *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 87-93 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

The buckling load of a simply supported composite shell structure is determined. The laminate properties including the transverse shear properties are derived from the classical laminate theory. From the general buckling equation the panel buckling allowable and the local buckling allowable of several types of cross sections are derived. The equations are put into a small FORTRAN program. Results for an undisturbed shell structure are in good agreement with the results from the finite difference program BOSOR 4. ESA

ADEQUATE FIBER REINFORCED STRUCTURAL ELEMENTS IN LOAD INTRODUCTION AREA OF FIBER REINFORCED SHELLS **c39**
F. S. D. Rekers *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 95-99 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Design of reinforcements around access holes and near cylinder ends in structural shells is discussed. Elements necessary for introduction of axial-load and bending moment in a cylinder are presented. Monolithical behavior; hoop stiffness; torsional stiffness; shear stiffness; and shear introduction were implemented in three different shell-configurations. ESA

N86-30771# Brussels Univ. (Belgium).
NEW PREDICTION METHODS FOR COMPOSITES HYGROTHERMAL BEHAVIOR **c24**
C. C. Hiel *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 101-107 Sponsored by NAS-NRC and NATO (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

A method to predict the thermal expansion and swelling of a composite material due to temperature and moisture variations which typically occur in a launch environment is presented. It is demonstrated that constitutive equations for moisture absorption and moisture-induced dimensional changes can be obtained with an internal variable method rooted in the theory of irreversible thermodynamics. Realism is injected into the model through the concept of free volume. ESA

DESIGN AND MANUFACTURING ASPECTS OF SPACE TRUSSES
H. W. Bergmann *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 109-115 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

The dimensional stability of fiber reinforced composites for large space structure trusses is discussed. Temperature and moisture effects cannot be accurately assessed by extrapolation from the response of small test coupons. The buckling strength of hollow filament-wound struts depends very sensitively on the angular directions of the individual plies. Optimal configurations can be derived by a computerized program. An alternative approach to filament-wound strut construction by surrounding a prefabricated foam core by carbon fiber rovings or fabrics is viable. The interconnection of struts in rigid three-dimensional trusses is possible by filament-wound joints with the advantages of low cost, low weight, and improved thermal compatibility. ESA

HIGH-STABILITY TELESCOPE STRUCTURES c89
G. Galipienso and S. DellAmico *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 119-132 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

A methodology for the design of structures requiring a high degree of dimensional stability, of the Space Telescope/GRIST type, was derived. The optimum structural configuration and the optimum laminate lay-up compatible with the structural strength and stiffness requirements were determined. The global behavior of the complete structure as a function of less-than-ideal component properties was established. Levels of maximum allowable deviations for real properties of components belonging to different families were determined. A method for adjustment of the coefficient of thermal expansion after manufacturing to compensate for unavoidable deviations in component properties was devised. A test method allowing measurement of very small distortions was developed. ESA

THERMAL STABILITY OF SANDWICH REFLECTORS c24
H. Groth *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 133-139 Sponsored by Ericsson Radio System (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

The inplane coefficient of thermal expansion (CTE) of the honeycomb sandwich of a spacecraft antenna reflector was treated using an analytical model, where the panel is treated like a sandwich panel, and an approach using the finite element method. Both methods are based on linear elasticity. For the first model the influence of different sandwich parameters is discussed. For the second model, the CTE is calculated for a typical panel, and results are compared with the first model. A difference between the two models is explained by the behavior of the honeycomb core. In the analytical model the core and the faces are assumed to keep their initial shape, i.e., no bending or out of plane deformations of the honeycomb cell walls or of the faces. The analytical model may therefore serve as an upper bound solution of the thermal expansion of the panel. ESA

DIMENSIONAL STABILITY OF CFRP TUBES FOR SPACE STRUCTURES
G. G. Reibaldi *In its* Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 141-147 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Dimensional stability of CFRP tubes used in spacecraft structures was investigated as a function of the number of thermal cycles. Length and weight decrease with the number of cycles. Thermal cycling generates microcracking, which increases desorption rate for the weight and length. For the SPAS tube T006 the length increases with respect to the initial value, probably due to large microcracking. The polythene bag does not influence the absorption rate. No clear asymptotic value for the weight and length variation with the increasing of thermal cycles is found. Permanent deformations are expected in orbit, about 25 microns after 300 thermal cycles. Lay-up of the CFRP tube is important for dimensional stability. A CIBA-GEIGY tube shows lower length variation, even if the weight loss is similar to that of the SPAS. ESA

HOLOGRAPHIC INTERFEROMETRY FOR DISTORTION MEASUREMENTS OF ANTENNAS c35
H. U. Frey *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 149-155 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Holographic interferometry was developed and adapted to a space environment simulation chamber. The test method is described and test results of antenna dishes from 1.2 to 3.6 m diameter are presented. ESA

N86-30777# California Univ., Berkeley. Dept. of Mechanical Engineering and Center for Advanced Materials.
DELAMINATION FRACTURE TOUGHNESS OF COMPOSITE SPACECRAFT STRUCTURES
C. K. H. Dharan *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 159-167 (For primary document see N86-30758 22-18)
(Contract DE-AC03-76SF-00098)
Avail: NTIS HC A16/MF A01

Opening mode (mode 1) delamination fracture behavior of graphite and aramid-epoxy composites was investigated. The effect of loading rate and reinforcement geometry (unidirectional vs woven) on fracture toughness was determined, and observation of the fracture surface was used to derive microfailure modes. A micromechanical delamination model to estimate the relative contributions of the matrix and the fiber-matrix interface to the overall delamination fracture toughness is proposed. Results show that the mode 1 delamination fracture toughness of graphite composites is small relative to glass composites. Woven graphite composites exhibit opening mode delamination crack energy release rates 2.5 times those of the unidirectionally reinforced material. The fracture surface of the graphite-epoxy laminates is characterized by clean exposed fiber surfaces indicating poor interfacial fracture toughness. ESA

INDUSTRIAL CALCULATION OF DAMAGE TOLERANCE AND STRESS ALLOWABLES IN COMPONENTS MADE OF COM-

POSITE MATERIALS USING THE PAM-FISS/BIPHASE MATERIAL MODEL **c39**
A. deRouvray and E. Haug *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 175-185 Sponsored by ESA/ESTEC (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

A finite element code to simulate the heterogeneous constitution of composite materials during the damage process was developed. The code simulates the basic damage mechanisms; matrix micro and macrocracking, fiber ruptures, layer delamination. It is used to calculate initial, tangent, and residual rheological properties, as well as damage (or defect) initiation and stable/unstable growth, in the critical zones of arbitrary composite structures. It provides realistic equivalent homogeneous properties (moduli; stress/strain allowables) compatible with an efficient damage tolerant design. ESA

ON CORRELATION BETWEEN THERMAL STRESSES, ELASTIC STRAIN ENERGY AND DEBONDING IN THERMALLY LOADED FIBER-REINFORCED COMPOSITE MATERIALS **c39**
F.-G. Buchholz *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 187-196 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Correlations between thermal stresses, elastic strain energy, and the energy release rate during debonding of unidirectionally fiber reinforced composite materials are investigated numerically. It is shown that the strain energy caused by thermal loads in a single circular unit cell of such a material is directly correlated with the energy spent by the compound on debonding of fiber and matrix. For a corresponding hexagonal unit cell within a compound two additional influences are effective, resulting in an interferred correlation and distinctly lower energy release rates during the process of debonding. ESA

N86-30781# Strathclyde Univ., Glasgow (Scotland). Dept. of Mechanics of Materials.
ASSESSING THE EFFECTS OF DELAMINATIONS ON THE POSTBUCKLING STRENGTH OF CRFP PANELS **c39**
W. M. Banks, J. Rhodes, and G. B. Chai *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 197-202 Sponsored by UK Ministry of Defense and ESA (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

The effect of deliberately inbuilt delaminations on the postbuckling strength of carbon fiber composite panels with a b/t ratio of 70 and 50 was tested. The panels are fabricated from 14 layers of unidirectional carbon fiber using an autoclave process. The delamination positions were chosen to coincide with the position of highest interlaminar shear stress, the position of highest direct strain, the central buckle peak, and the inflection points on the panel. The control panel for a b/t ratio of 68.57 failed prematurely due to unforeseen edge effects. However it is clear that the worst position for delamination is when it coincides with the highest interlaminar shear stress at the edge of the panel. There appears to be little effect with the delamination at the buckle peak. ESA

INTEGRITY OF CARBON FIBER REINFORCED PLASTICS. STRUCTURAL ELEMENTS, SCREENING PROCEDURES, OPPORTUNITIES AND OPEN ISSUES **c24**
Werner H. Paul *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 211-215 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Activities (of the standard design procedure) necessary to prevent catastrophic failures of CFRP manufactured items in manned spaceflight due to global or local deficiencies are discussed. Criteria which CFRP structural elements must meet in order to be used in STS are given. ESA

N86-30784# Messerschmitt-Boelkow-Blohm G.m.b.H., Bremen (West Germany).
NONDESTRUCTIVE TESTING OF FIBER REINFORCED COMPOSITES USING X-RAY FINE STRUCTURE PROCEDURES **c38**
J. Walter and Henschel (Bundesanstalt fuer Materialpruefung, Berlin, West Germany) *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 217-229 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Nondestructive inspection (NDI) of fiber reinforced composites is introduced. Nondestructive testing with the X-ray fine structure procedure is based on the fact that the paracrystalline microstructure of the fibers diffracts the X-rays at the lattice planes. The long chain molecules are arranged in a nearly crystalline (paracrystalline) configuration; the chains have a high degree of orientation parallel to the fiber axis, so that the X-ray pattern produced by a bundle of fibers irradiated in a directional normal to their long axis is typical for the specific type. This property can be used as NDI-criterion and thickness layer measurement method. ESA

N86-30785# Fulmer Research Inst. Ltd., Stoke Poges (England).
DEVELOPMENTS IN THE NONDESTRUCTIVE EVALUATION (NDE) OF COMPOSITE MATERIALS **c38**
R. L. Crocker *In its* Proceedings of a Workshop on Composites Design for Space Applications (ESA-SP-243) Feb. 1986 p 231-235 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

The effects on composites inspection of digital techniques of computing and data storage, robotics, and image processing made possible by digitizing raw data are assessed. Ultrasonics, X-radiography, thermography, mechanical impedance, vibrothermography, and laser holography are discussed. In many cases the actual defect detection capability is not changed by introducing these techniques, it is the integrity of the inspection or evaluation which is improved. ESA

N86-30786# Societe Nationale Industrielle Aerospatiale, Les Mureaux (France).
INCREASING USE OF COMPOSITE STRUCTURE ON ARIANE LAUNCHERS **c15**
F. Perez and P. Eymard (Centre National d'Etudes Spatiales, Paris, France) *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 239-244 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

The progressive use of composite structures on Ariane launchers 1 to 4 generation and the tendency for Ariane 5 is outlined. Carbon fiber and glass fiber reinforced plastics are involved. Mass saving, rigidity requirements, and cost arguments are mentioned. Rupture criteria, orthotropic effects, thermal effects and quality control are discussed. ESA

N86-30787# Royal Netherlands Aircraft Factories Fokker, Schiphol-Oost. Space Div.

DEVELOPMENT OF THE ARIANE 4 INTERSTAGE 2-3 IN CFRP **c15**
C. Blaas *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 245-249 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

For the Ariane 4 interstage 2/3, stiffened skin panels of CFRP were developed. The panels are 1.0 m wide and 2.7 m long. Each panel has 15 blade-type stiffeners with a height of 25 mm on a pitch of 68 mm. The material used is Fiberite 976-T300 in laying sequences of 45 and 0 deg. The total mass reduction of the structure compared to the aluminum version is greater than 20%. In the design of the structure, classical laminate theory and the numerical programs BOSOR 4, NASTRAN and SINDA were used. ESA

N86-30788# British Aerospace Dynamics Group, Stevenage (England). Space and Communications Div.
THE DEVELOPMENT OF THE ARIANE 4 SPELDA **c15**
N. G. Thomas and W. T. Oliver *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb 1986 p 251-263 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Structural design of the load carrying external structure used as Ariane upper payload support and lower payload protector, the so-called SPELDA, is outlined. Major design drivers for SPELDA were mass, stiffness, and strength. A CFRP faced honeycomb sandwich was adopted. The models, test methods, design steps, and manufacturing and analysis problems are summarized. ESA

N86-30789# National Space Development Agency, Tokyo (Japan).
DESIGN AND DEVELOPMENT OF THE GRAPHITE EPOXY STRUCTURE FOR CS-3 SATELLITE
Tsuneo Kawashima, Toshio Inoue (Mitsubishi Electric Corp., Kanagawa, Japan), and Hiromi Seko *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 267-274 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

The CS-3 satellite design requirements, internal load analysis of the structural members, laminate design of CFRP components, sheet/core design of equipment panels, configurations of the structural members, development tests, of the structural thermal model, and the results of weight reductions are described. Designs that attain the minimum weight were performed for main structures such as the thrust tube and the equipment panels. Weight reductions of the secondary structures such as joints, brackets and end fittings of struts greatly contribute to the weight reduction of the structure. The structure weighs 53 kg, i.e., 4.9% of the 1088 kg launch weight. ESA

N86-30790# British Aerospace Dynamics Group, Bristol (England). Space and Communications Div.
DESIGN AND DEVELOPMENT TESTING OF THE BONDED JOINT BETWEEN A TYPICAL LAUNCH VEHICLE ATTACHMENT RING AND CFRP THRUST CONE **c15**
J. T. Sharkey, G. H. F. Nayler, and J. Reynolds *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 275-284 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

The development of the principal structural joint of a Shuttle payload is described. The joint is subjected to large tension and compression loads due to the spacecraft being cantilevered perpendicular to the direction of flight of the launch vehicle. Finite element modeling was included in the investigation of joint designs. A bonded and bolted double lap shear configuration was chosen. Manufacturing and inspection methods were developed and testing of joint samples was undertaken including static, thermal and fatigue loading. The static test results were used to determine the design allowable strength of the joint. ESA

N86-30791# Messerschmitt-Boelkow-Blohm G.m.b.H., Bremen (West Germany).
ON THE DEVELOPMENT OF A CORRUGATED CFRP CENTRAL CYLINDER FOR SATELLITES
D. Brosda *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 285-290 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Development of a corrugated central cylinder for satellites in the DFS-class, including design, analyses, manufacture, assembly and tests is summarized. The central cylinder has a mean diameter of 938 mm and a length of 1780 mm. The cylinder wall consists of a corrugated CFRP shell of variable thickness. Three CFRP rings provide for the attachment of antenna, equipment, and payload platforms. The thrust cylinder is designed to meet the standard frequency requirements (less than 15 Hz lateral and less than 35 Hz axial) and carry the loads associated with a typical satellite mass of 1400 kg whose CG position lies 1000 mm above the separation plane. The first flight structure to be equipped with the cylinder is the German communication satellite DFS Kopernikus. ESA

N86-30792# Societe Nationale Industrielle Aerospatiale, Les Mureaux (France).
COMPARISON OF CLASSICAL AND COCURING MANUFACTURING TECHNIQUES FOR A CFRP HONEYCOMB CENTRAL TUBE **c31**
J. L. Pettex *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 291-294 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Classical and cocuring manufacturing of a sandwich structure using CFRP skins and an aluminum alloy honeycomb core for the Arabsat central tube are compared. The cocuring technology leads to a simplification of the manufacturing and consequently to a cost reduction. ESA

FIBER REINFORCED PLASTIC CASES FOR SOLID PROPELLANT MOTORS **c20**
H. Krings and J. Scharringhausen *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 295-299 Sponsored by ESA, BMFT, DFVLR and CNR (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

The design, fabrication, and tests performed for the FRP-cases for solid propellant motors of MAGE apogee boost motors are described. Definition of launcher and satellite requirements, and qualification of the motor are presented. ESA

N86-30794# Messerschmitt-Boelkow-Blohm G.m.b.H., Ottobrunn (West Germany).
STRENGTH OF CARBON FIBER COMPOSITE/TITANIUM BONDED JOINTS AS USED FOR SPAS-TYPE STRUCTURES
J. Franz and H. Laube *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 301-308 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

The analytical and experimental verification of bonded tubes used for SPAS strut assemblies is described. The strut elements consist of a carbon fiber tube and two titanium mounting elements, connected by tapered, double-shear bonded joints. The analysis of the geometric design minimized the shear stress peaks at the ends of the overlapping section under external and temperature loadings. The load capability is verified by a destructive qualification test program (static load and fatigue) and each individual strut is acceptance tested before integration into a satellite structure. Data can be used for load capability estimations for similar strut components, i.e., with increased or decreased tube diameter, or with modified overlapping length of the bonding section. ESA

N86-30795# Maschinenfabrik Augsburg-Nuernberg A.G., Munich (West Germany). Neue Technologie.
MANUFACTURING TECHNOLOGY OF GRAZING-INCIDENCE MIRROR CARRIERS MADE OF CARBON FIBER REINFORCED

EPOXY MATRIX SYSTEMS c89
J. Klug *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 311-318 Sponsored by ESA (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

Manufacturing techniques for the low energy telescopes for the X-ray Multi Mirror mission were studied. X-ray parabolic mirror carriers onto which the reflecting X-ray surface was transferred by the replica method as developed for EXOSAT were fabricated. Instead of using beryllium carriers, the use of carbon fiber reinforced epoxy carriers was investigated, for the series production envisaged for XMM. Carrier design and manufacturing, carrier characteristics obtained, critical areas encountered during the feasibility study, and future activities are discussed. ESA

DESIGN AND DEVELOPMENT OF THE ADVANCED RIGID ARRAY (ARA) SOLAR PANEL c44
R. W. H. Horsselenberg *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 319-328 (For primary document see N86-30758 22-18)
Avail: NTIS HC A16/MF A01

The Advanced Rigid Array panel technologies are summarized: specific weight is less than 1.2 kg/sqm; can survive extreme thermal cycling (plus 80 to minus 180 C); excellent flatness and dimensional stability; extremely high stiffness properties due to application of GY-70 carbon fiber; high satellite interface flexibility; high panel sizing flexibility; and simple and low cost production. Developments include the establishment of panel technologies to obtain specific weights below 0.8 kg/sqm via open lay-up CFRP facesheet technology. ESA

N86-30797# Messerschmitt-Boelkow-Blohm G.m.b.H., Munich (West Germany).
DEVELOPMENT OF AN ANTENNA STRUCTURE FOR A DEPLOYABLE OFFSET ANTENNA c32
H. Herbig, W. Tauber, and H. Vorbrugg *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 329-336 (For primary document see N86-30758 22-18) (Contract ESTEC-5206/82-NL-PB(S6))
Avail: NTIS HC A16/MF A01

An unfurlable spacecraft antenna is described. The antenna consists of a central hub, ribs being radially arranged around the hub, and a mesh which produces the parabolic reflector surface shape. The hub and the ribs are made of CFRP. For the stowed and deployed reflector configuration the CFRP-components were analyzed and optimized under dynamical and dimensional stability aspects. The analytical results and the development of the CFRP components are presented. ESA

N86-30798# Messerschmitt-Boelkow-Blohm G.m.b.H., Munich (West Germany).
STRUCTURAL ANALYSIS, MANUFACTURING AND TEST EVALUATION OF A POLARIZATION SENSITIVE REFLECTOR c32
W. Weiss, K. Pfeifer, and R. Leitner *In* ESA Proceedings of a Workshop on Composites Design for Space Applications Feb. 1986 p 337-347 (For primary document see N86-30758 22-18) (Contract ESTEC-5494/84-NL(CM))
Avail: NTIS HC A16/MF A01

A parabolic reflector for space applications was developed. The reflector consists of two Kevlar/Nomex sandwich shells with a diameter of 1100 mm. Their edges are connected by a Kevlar/glass ring. The rear shell is fixed to the satellite by a conical carbon fiber composite cylinder and stiffened by four Kevlar/Nomex ribs. To minimize the thermal stresses the thermal expansion coefficients were adjusted to the reflector shells. In the static analysis a finite element calculation was performed for an acceleration of 15 g and for the most critical Sun irradiation with a partly shadowed reflector. All stresses are below the strength limits. The antenna was tested by sine vibration, acoustic noise, thermal cycling, and solar simulation without failure. ESA

APPLICATION OF THE LQG/LTR TECHNIQUE TO ROBUST CONTROLLER SYNTHESIS FOR A LARGE FLEXIBLE SPACE ANTENNA
Suresh M. Joshi, Ernest S. Armstrong, and N. Sundararajan (Old Dominion Univ., Norfolk, Va.) Sep. 1986 64 p
(NASA-TP-2560; L-16076; NAS 1.60:2560) Avail: NTIS HC A04/MF A01 CSCL 22B

The problem of synthesizing a robust controller is considered for a large, flexible space-based antenna by using the linear-quadratic-Gaussian (LQG)/loop transfer recovery (LTR) method. The study is based on a finite-element model of the 122-m hoop/column antenna, which consists of three rigid-body rotational modes and the first 10 elastic modes. A robust compensator design for achieving the required performance bandwidth in the presence of modeling uncertainties is obtained using the LQG/LTR method for loop-shaping in the frequency domain. Different sensor actuator locations are analyzed in terms of the pole/zero locations of the multivariable systems and possible best locations are indicated. The computations are performed by using the LQG design package ORACLS augmented with frequency domain singular value analysis software. Author

EFFECTS OF MODEL ERROR ON CONTROL OF LARGE FLEXIBLE SPACE ANTENNA WITH COMPARISONS OF DECOUPLED AND LINEAR QUADRATIC REGULATOR CONTROL PROCEDURES
Harold A. Hamer and Katherine G. Johnson Sep. 1986 52 p
(NASA-TP-2604; L-16114; NAS 1.60:2604) Avail: NTIS HC A04/MF A01 CSCL 22B

An analysis was performed to determine the effects of model error on the control of a large flexible space antenna. Control was achieved by employing two three-axis control-moment gyros (CMG's) located on the antenna column. State variables were estimated by including an observer in the control loop that used attitude and attitude-rate sensors on the column. Errors were assumed to exist in the individual model parameters: modal frequency, modal damping, mode slope (control-influence coefficients), and moment of inertia. Their effects on control-system performance were analyzed either for (1) nulling initial disturbances in the rigid-body modes, or (2) nulling initial disturbances in the first three flexible modes. The study includes the effects on stability, time to null, and control requirements (defined as maximum torque and total momentum), as well as on the accuracy of obtaining initial estimates of the disturbances. The effects on the transients of the undisturbed modes are also included. The results, which are compared for decoupled and linear quadratic regulator (LQR) control procedures, are shown in tabular form, parametric plots, and as sample time histories of modal-amplitude and control responses. Results of the analysis showed that the effects of model errors on the control-system performance were generally comparable for both control procedures. The effect of mode-slope error was the most serious of all model errors. Author

DESIGN, FABRICATE AND TEST SPACECRAFT AUTOMATIC ACTIVE DISCHARGE SYSTEM (SAADS) Final Report, 20 Jul. 1983 - 15 Jun. 1985
Robert S. Hills 25 Sep. 1985 18 p
(Contract F19628-83-C-0153)
(AD-A166559; C-214; AFGL-TR-85-0236) Avail: NTIS HC A02/MF A01 CSCL 22/2

The objective of this contract is the design, fabrication, and testing of a Spacecraft Automatic Active Discharge System (SAADS) which will attempt to automatically control and dissipate the vehicle charge as a function of natural or induced disturbances in space. A microprocessor based controller will monitor and manipulate data from a Proton Electrostatic Analyzer (ESA) to determine if the vehicle charge is greater than a predetermined value and then activate a Plasma Source to discharge the vehicle. The plasma source short circuits the charge. This equipment is to be flown as part of the BERT I payload to demonstrate the feasibility of the system for eventual use in a satellite in a true space environment. GRA

CONTROL OF LARGE FLEXIBLE SYSTEMS BY SPATIAL MODAL INPUT-DISTRIBUTION CONTROL M.S. Thesis
Craig V. Bendorf 1985 113 p
(AD-A166912; AFIT/CI/NR-86-47T) Avail: NTIS HC A06/MF A01 CSCL 22/2

A common problem in controlling a large flexible structure with a reduced order model is the excitation of the residual (non-modeled) modes by the control inputs resulting in control spillover. In this thesis a new approach to eliminate control spillover is examined. This approach, based on the independent modal-space control method, uses a finite number of spatially distributed input points to eliminate control spillover. Control of an undamped beam and a finite degree of freedom truss is accomplished through computer simulation. The results of the seven example problems shows that this new approach does effectively eliminate control spillover. GRA

WINDING WITH THERMOPLASTIC POLYMERS
J. L. Tisne and J. Bouvard 1986 8 p Presented at 3rd European Symposium on Spacecraft Materials in Space Environment, Noordwijk, Netherlands, 3 Oct. 1985 Previously announced as N86-22613
(SNIAS-861-430-106; ESA-86-97168) Avail: NTIS HC A02/MF A01

Filament winding of continuous fibers impregnated with thermoplastic resins for spacecraft structure manufacturing is described. The mandrel is at ambient temperature, or is maintained below the fusion temperature, which enables winding unstable trajectories by means of the under layer/strand sticking. Another method consists in having the material and the mandrel at the fusion temperature while winding. This process simplifies the machine but presents two drawbacks, with respect to the thermoset resins: it is impossible to wind other than stable trajectories, close to geodetic ones; and the curing on the thermoset epoxy (maximum 180 C) is replaced by a fusion in an oven (from 250 to 400 C). This poses a problem of resistance of the enclosed parts and tools. ESA

ULTRAVIOLET SPECTROMETER AND POLARIMETER (UVSP) SOFTWARE DEVELOPMENT AND HARDWARE TESTS FOR THE SOLAR MAXIMUM MISSION Final Report
M. E. Bruner and B. M. Haisch 31 Jan. 1986 223 p
(Contract NAS5-24119)
(NASA-CR-177889; NAS 1.26:177889; LMSC-F067851) Avail: NTIS HC A10/MF A01 CSCL 14B

The Ultraviolet Spectrometer/Polarimeter Instrument (UVSP) for the Solar Maximum Mission (SMM) was based on the re-use of the engineering model of the high resolution ultraviolet spectrometer developed for the OSO-8 mission. Lockheed assumed four distinct responsibilities in the UVSP program: technical evaluation of the OSO-8 engineering model; technical consulting on the electronic, optical, and mechanical modifications to the OSO-8 engineering model hardware; design and development of the UVSP software system; and scientific participation in the operations and analysis phase of the mission. Lockheed also provided technical consulting and assistance with instrument hardware performance anomalies encountered during the post launch operation of the SMM observatory. An index to the quarterly reports delivered under the contract are contained, and serves as a useful capsule history of the program activity. B.G.

SOLID-PROPELLANT ROCKET MOTOR INTERNAL BALLISTICS PERFORMANCE VARIATION ANALYSIS, PHASE 5 Final Report
Richard H. Sforzini and Jesse E. Murph Jan. 1980 65 p
(NASA-CR-177145; NAS 1.26:177145) Avail: NTIS HC A04/MF A01 CSCL 21H

The results of research aimed at improving the predictability of internal ballistics performance of solid-propellant rocket motors (SRM's) including thrust imbalance between two SRM's firing in parallel are presented. Static test data from the first six Space Shuttle SRM's is analyzed using a computer program previously developed for this purpose. The program permits intentional minor design biases affecting the imbalance between any two SMR's to be removed. Results for the last four of the six SRM's, with only the propellant bulk temperature as a non-random variable, are generally within limits predicted by theory. Extended studies of internal ballistic performance of single SRM's are presented based on an earlier developed mathematical model which includes an assessment of grain deformation. The erosive burning rate law used in the model is upgraded and made more general. Excellent results are obtained in predictions of the performances of five different SRM's of quite different sizes and configurations. These SRM's all employ PBAN type propellants with ammonium perchlorate oxidizer and 16 to 20% aluminum except one which uses carboxyl terminated butadiene binder. The only non-calculated parameters in the burning rate equations that are changed for the

different SRM's are the zero crossflow velocity burning rate coefficients and exponents. The results, in general, confirm the importance of grain deformation. The improved internal ballistic model makes practical development of an effective computer program for application of an optimization technique to SRM design which is also demonstrated. The program uses a pattern search technique to minimize the difference between a desired thrust-time trace and one calculated based on the internal ballistic model. M.G.

EVALUATION OF IGNITER COMPOSITIONS SR371C AND SR44
L. M. Davis Nov. 1985 20 p
(AD-A167007; WSRL-0424-TM) Avail: NTIS HC A02/MF A01 CSCL 21/2

The ignition performance of compositions SR371C and SR44 in two types of containers was examined in a test vessel. It was found that igniters containing composition SR44 had lower ignition delay times and maximum pressures than those with composition SR371C. It is recommended that further investigations be conducted to determine the minimum mass of composition SR44 required to ignite a given rocket motor. Author (GRA)

FLIGHT SERVICE EVALUATION OF COMPOSITE COMPONENTS ON THE BELL HELICOPTER MODEL 206L Annual Flight Service Technical Summary Report
H. E. Wilson, II Aug. 1986 53 p
(Contract NAS1-15279)
(NASA-CR-178148; NAS 1.26:178148; AFSR-2) Avail: NTIS HC A04/MF A01 CSCL 11D

This is the second annual report on the flight service components for the Bell Model 206L JetRanger helicopter. The components have been placed in service in the Continental United States, Canada, and Alaska. The report covers the period from 1 August 1983 to 1 January 1986. The status of 34 sets of components is discussed in this report. Approximately 73,000 flight hours were accumulated on the components as of 1 January 1986. Three years of coupon tests on the components are presented with test results. A vertical fin had been struck by lightning and the results of its examination and tests are included. Author

Composite structures of yttria (4.5 mol%) stabilized zirconia (YSZ) with added Al2O3 (0.3 to 7.5 wt%) were investigated. Pressed YSZ compacts prepared from submicrometer powders of >99% purity were sintered in the range 1200 to 1350 C for 0.5 to 24 h. Uniform grain size microstructures (0.2 to 0.4 micrometers) were obtained which showed discrete Al2O3 grains dispersed throughout. X-ray diffraction and Raman spectral analysis indicated a combination of both cubic and tetragonal phases. Measured lattice parameters were observed to vary irregularly with Al2O3 content. DC conductivity was found to increase with added Al2O3 less than 3 wt%. Strength vaules obtained for the composites were in excess of 9 Mpa x the squareroot of M (K sub Ic) and 425 MPa (MOR), significantly higher than reported for cubic phase YSZ. The increased strength was attributed to small grain size as well as to crack deflection and arrest mechanisms associated with the dispersed high modulus and lower expansion second phase. The presence of a monoclinic phase was not detected in the samples either before or after fracture, hence the strengthening could not be ascribed to transformation toughening. GRA

PULSED LASER AND ION BEAM SURFACE MODIFICATION OF SINTERED ALPHA-SiC
K. L. More, R. F. Davis, B. R. Appleton, D. Lowndes, and P. Smith 2 Dec. 1985 9 p Presented at the Symposium on Phase Transitions in Condensed Systems: Experiments and Theory,

Pittsburgh, Pa., 2 Dec. 1985 Prepared in cooperation with North Carolina State Univ., Raleigh and Microelectronics Center or North Carolina, Research Triangle Park
(Contracts DE-AC05-84OR21400; DE-AC05-76OR-00033)
(DE86-008978; CONF-851260-3) Avail: NTIS HC A02/MF A01

Pulsed laser annealing and ion beam mixing have been used as surface modification techniques to enhance the physical properties of polycrystalline (ALPHA)-SiC. Thin Ni overlayers (20 nm to 100 nm) were evaporated onto the SiC surface. The specimens were subsequently irradiated with pulses of a ruby or krypton fluoride (KrF) excimer laser or bombarded with high energy Xe(+) or Si(+) ions. Both processes are nonequilibrium methods and each has been shown to induce unique microstructural changes at the SiC surface which are not attainable by conventional thermal treatments. Under particular (and optimum) processing conditions, these changes considerably increased the mechanical properties of the SiC; following laser irradiation, the fracture strength of the SiC was increased by as much as 50%, but after ion beam mixing, no strength increase was observed. High resolution cross-section transmission electron microscopy (X-TEM), scanning electron microscopy (SEM), and Rutherford backscattering techniques were used to characterize the extent of mixing between the Ni and the SiC as a result of the surface modification. REACTIONS OF ORGANIC MOLECULES ON TRANSITION METAL SURFACES Final Report, 1 Sep. 1982 - 31 Oct. 1985
Jay B. Benziger Feb. 1986 14 p
(Grant AF-AFOSR-0302-82)
(AD-A166214; AFOSR-86-0148TR) Avail: NTIS HC A02/MF A01

CSCL 07/4

This project has examined reactions of organic molecules on transition metal surfaces to develop a mechanistic framework for clasifying surface reactions. Electron and mass spectroscopies in conjunction with infrared spectroscopy have been used to examine reactions of organic compounds on well characterized tungsten and nickel surfaces in vacuum, as well as using voltammetry with infrared spectroscopy to study reactions on platinum electrodes. The semi-infinite nature of the metal surface provides a reagent that can act as both an electron donor and acceptor from the same Fermi level. The surface also imposes steric constraints that cause dramatic changes in adsorption with subtle changes in molecular structure. These effects have been demonstrated through spectroscopic measurements of the molecular orientation and surface reactions of benzene and pyradine and their methyl-substituted derivatives on a Ni(100) surface. LASER SPECTROSCOPY OF OZONE Final Report, 1 Jul. 1980 - 30 Sep. 1985

James L. Kinsey 18 Dec. 1985 11 p

(Contract F19628-80-K-0088)

(AD-A166516; AFGL-TR-86-0006) Avail: NTIS HC A02/MF A01 CSCL 07/4

Data have been obtained for the first time on the fluorescence spectrum of ozone in the Hartley continuum region. This type of data provides information for a new kind of spectroscopy with hitherto unprecedented capabilities for studying both ground state vibrational structure and excited state dissociation dynamics. From this data and theoretical models, qualitative generalizations are made about the potential energy surface of the electronic state of the Hartley transition. Experiments have also been conducted to obtain the high resolution spectrum of some of the Huggins bands for jet-cooled ozone. An analysis of the partially resolved rotational structure of these bands indicates that the symmetry of the Huggins bands is the same as that for the Hartley continuum. GRA

THE USE OF A PYROCHEMILUMINESCENT NITROGEN ANALYZER AS A CAPILLARY GC (GAS CHROMATOGRAPH) DETECTOR Final Report, Mar. - May 1985

Edward W. Pitzer Feb. 1986 21 p

(AD-A166597; AFWAL-TR-85-2077) Avail: NTIS HC A02/MF A01 CSCL 07/4

A study was conducted to determine the feasibility of interfacing a pyrochemiluminescent nitrogen analyzer to a high resolution glass capillary gas chromatograph. The instruments used were a Varian Model 3700 gas chromatograph and an Antek Model 703C pyrochemiluminescent nitrogen analyzer. Known standards of nitrogen containing compounds were prepared in shale derived jet propulsion fuel that had been previously determined to have no nitrogen containing species. These solutions were then chromatographed on the GC/CLD system. The resulting data were reduced using relative response factors with an internal standard. The nitrogen content of the standard solutions were validated by analyses on a separate Antek nitrogen analyzer used to determine total nitrogen content. The method of GC/CLD was deemed feasible. However, it is recommended that appropriate design changes be made to the Antek Model 703C nitrogen analyzer to accommodate the type of flows common with capillary gas chromatographs. GRA

A LINEAR ARRAY FOR RAYLEIGH SCATTERING Final Report, 1 Sep. 1983 - 31 Jan. 1985

L. Talbot 11 Jun. 1985 27 p

(Grant AF-AFOSR-0229-83)

(AD-A167109; AFOSR-86-0161TR) Avail: NTIS HC A03/MF A01 CSCL 07/4

Gas density under combustion conditions can be obtained by measuring the intensity of the molecular (Rayleigh) scattering of light from a laser beam. A system which obtains an essentially continuous record of the density along a length of the laser beam is described. The temperature and degree of combustion can thus be determined for a number of interesting combustion configurations, which will ultimately lead to a better description and understanding of combustion flow flame field phenomena. An image of Rayleigh scattered light from the combustion region is projected onto a monolithic self scanning linear photodiode array by means of a lens, bandpass filter, slit, image intensifier, and fiber optic reducer. The video output of the linear array is digitized and stored, creating a space-time map of the density which can be visualized and manipulated as an image. Analysis of these images by image processing techniques gives qualitative and quantitative information about such features of the combustion zone as flame wrinkling and periodicity, flame thickness and continuity, and other structural and time dependent properties in the combustion region. Following a brief introduction, the components are described, the system performance characteristics are discusssed, and an example of a processed image from a simple turbulent flame is presented. MEASUREMENT OF RATE CONSTANTS OF ELEMENTARY GAS-REACTIONS OF IMPORTANCE TO UPPER ATMOSPHERE AND COMBUSTION SYSTEMS Final Report, 14 Dec. 1984 - 13 Dec. 1985

Frederick Kaufman 24 Feb. 1986 10 p

(Grant AF-AFOSR-0044-85)

(AD-A167177; AFOSR-86-0222TR) Avail: NTIS HC A02/MF A01 CSCL 14/2

This report discusses the Air Force's enhanced flow reactor. The major items purchased were a bakeable, differentially pumped, UHV envelope to interface the mass spectrometer to the flow tube and an excimer pumped dye laser system for laser excited fluorescence (LEF) detection of radicals in the flow tube. The LEF system, employing a Lambda Physik excimer pumped dye laser (EMG 103 MSC/FL 2001), has been operational since mid-autumn. It has already been used in preliminary studies of our new methoxy radical source. Completion of the mass spectrometer system was delayed by a variety of problems. However, by late October the required parts were on hand, and the vacuum envelope, sans mass spectrometer, was successfully pumped down. The complete system is currently assembled and undergoing final testing. GRA

MODELING AND DIAGNOSTICS OF COMBUSTION IN SPARK-IGNITION ENGINES
F. V. Bracco 1985 13 p Presented at the International Symposium on Diagnostics and Modeling of Combustion in Reciprocating Engines, Tokyo, Japan, 4 Sep. 1985
(Contract DE-AC04-81AL-16338)
(DE86-008173; CONF-850915-1) Avail: NTIS HC A02/MF A01

Subjects are considered that have not been extensively covered in recent reviews. The following is concluded. Simple ensemble averaging is not suited for engine flows. In an engine, what is turbulence and what is bulk (mean) flow is relative to the process that is influenced by the flow. Near TDC, turbulence is always insensitive to the details of the turbulence generated during intake. For a given engine, without strong squish and/or swirl, turbulence intensity and diffusivity near TDC increase with increasing initial turbulent diffusivity but run into upper limits imposed by turbulence damping due to the chamber walls. In spite of many uncertainties and limitations, multi-dimensional combustion models have been shown to be useful by industrial applications. Improved modeling of the flame structure is the subject of greatest current interest. Spatially and temporally resolved measurements are needed of: turbulence intensity with combustion; turbulence length scales without and with combustion; flame establishment and structure; interactions of flame and walls; and the onset of knock. DOE

USING TEMPERATURE-PROGRAMMED REACTION FOR KINETIC ANALYSIS OF REACTIONS IN DILUTE AQUEOUS SOLUTIONS AT HIGH PRESSURE
L. F. Brown and B. A. Robinson 1986 26 p Presented at the 9th International Symposium on Chemical Reaction Engineering, Philadelphia, Pa., 18 May 1986
(Contract W-7405-eng-36)
(DE86-003683; LA-UR-85-3936; CONF-860530-2) Avail: NTIS HC A03/MF A01

The technique of temperature-programmed reaction (TPR) is shown to be a practical experimental method for determining reaction-rate expressions and kinetics parameters for reactions in dilute aqueous solutions under high ambient pressure. By sampling and measuring the extent of reaction during a rise in temperature, information normally obtained from a series of isothermal batch kinetics experiments can be found in a single TPR test. The use of nonlinear least-squares regression eliminates the need to achieve a constant rate of temperature rise, simplifies the experimental requirements for TPR results, and gives more accurate answers than does a linear analysis of TPR results. Numerical simulations of TPR tests in the presence of random concentration-measurement error is used to assess the accuracy of the technique and to identify the best values of crucial operating parameters. The results of two TPR experiments measuring the alkaline hydrolysis of ethyl acetate demonstrate the applicability of the technique to reactions in dilute aqueous solutions at high pressure. These preliminary experimental results, along with numerical simulations, allow us to chart a course for future TPR kinetics experiments on a large number of similar reactions. DOE

EXPERIMENTAL VALIDATION OF DIESEL SPRAY COMBUSTION Annual Report
Colin R. Ferguson 1985 83 p
(Contract DE-AC04-81AL-17085)
(DE86-007773; DOE/AL-17085/T2) Avail: NTIS HC A05/MF A01

Multidimensional models are being developed to predict flow, heat transfer and combustion within internal combustion engines. Measurements have been made of the total rate of heat loss and the half radius swirl velocity of an unsteady, turbulent swirling flow within a cylinder for different aspect ratios. The instantaneous heat loss correlates with the half radius swirl velocity by Nusselt-Reynolds number power law. The correlation is independent of aspect ratio if the filling of the cylinder results in a flow field which is axi-symmetric and shows no axial variation outside the boundary layers. Heat loss and angular momentum decay in a constant volume cylindrical vessel is of interest because the flow has features similar to flows in internal combustion engines. The relationship of the ideal experiment to the more practical case is analogous to the relation between a flat plate and an airfoil. A technical review of laser shadowgraph, contract schlieren and color schlieren flow visualization techniques is presented. Demonstration experiments are performed to graphically illustrate the effects of system design variables on image quality. Techniques for obtaining exposure durations on the order of ten microseconds or less are demonstrated. DOE

(Contract DE-AC04-76DR-00789)
(DE86-008838; SAND-86-8213) Avail: NTIS HC A03/MF A01

A turbulent reacting flow working group has been established through the Department of Energy/Office of Basic Energy Sciences. The purpose of this group is to establish and maintain a strong interaction and active dialogue between workers currently involved in modeling turbulent reacting flows and those involved in related experiments. One objective of this collaboration is to develop an increased understanding of the fundamental interaction between the chemical and fluid dynamical processes occurring in chemically reacting flows, and to utilize this understanding to improve predictive capabilities for turbulent combustion of hydrocarbon fuels. Regular members, who represent academia, private industry, and national laboratories, and guests participate in the meetings. Several guests are invited to each meeting to provide an influx of different ideas and opinions to the discussions. This document is a summary of the discussion that took place during the sixth meeting, which was held at Cornell University on October 7 to 8, 1985. DOE

MODEL OF CRACK ELECTROCHEMISTRY
C. A. Oster and M. J. Danielson Mar. 1986 58 p
(Contract DE-AC06-76RL-01830)
(DE86-009346; PNL-5821) Avail: NTIS HC A04/MF A01

This document describes a rather general mathematical model of crack tip electrochemistry. First the general mass transport problem is discussed along with the chemistry expected to take place within the crack. The final equations used are extracted and the numerical algorithm presented for producing the final approximation to the original problem. At least two items have been ignored in the paper. A number of models for the crack tip exist. Only one is described here. Initial experience indicates that other geometries may complicate things during computation but have little effect on the final solution. The second item involves limiting the electrochemistry by solubility limits. Experiments indicate that when precipitation of $Ni(++)$ occurs there is a dramatic reduction in anodic current. Indeed, examination of the boundary condition and other governing equations indicate that if precipitation occurs over any finite continuous interval which includes the tip, then the total anodic current at the tip vanishes. Hence the crack growth from corrosion stops. This observation indicates that more research is needed to obtain a useful model of the crack tip when precipitation occurs. DOE

SILICA GEL SORPTION PROPERTIES UNDER ADIABATIC CONDITIONS
A. A. Pesaran and K. Choudhury Feb. 1986 61 p
(Contract DE-AC02-83CH-10093)
(DE86-004439; SERI/TR-252-2704) Avail: NTIS

HC A04/MF A01

The SERI Sorption Test Facility was modified from isothermal operation to adiabatic operating conditions so that we could measure the adsorption/desorption characteristics of silica-gel-coated, parallel-channel geometry as a function of operating conditions and aspect ratio under adiabatic conditions. We performed single-blow experiments on two single-passage test cells with different aspect ratios, air flow rates, and inlet conditions. Both adsorption and desorption runs were performed. As the air flow rate and aspect ratio increase when other parameters are kept constant, the desiccant matrix loses its sorption capacity faster. The test cell operated near isothermal conditions rather than adiabatically because the cell walls had a large thermal mass compared with the amount of desiccant used. Since constructing single-passage test cells with small thermal masses that can be operated adiabatically at the Sorption Test Facility is difficult, further testing at this facility will be primarily for isothermal operation. The adiabatic experiments can best be done with multipassage test cells having small thermal masses relative to desiccant mass. A single-blow test facility for performing experiments with multipassage test cells was fabricated in FY 1984, and experiments were performed in an FY 1985 desiccant project. DOE

STRUCTURE OF THE EQUATION OF STATE OF REAL GASES AND LIQUIDS [STRUKTUR DER ZUSTANDSFUNKTION REALER GASE UND FLUESSIGKEITEN]

J. Bortfeldt Dec. 1985 26 p In GERMAN; ENGLISH summary
(PTB-Me-69; ISSN-0341-6720; ESA-86-97415) Avail: NTIS HC A03/MF A01

Questions concerning the structure of the equation of state of real gases and liquids were studied. The virial theorem of mechanics and an assumption on the expression for potentials were used. Data for water were used to get an insight into the behavior of real matter. The result valid for a perfect Bose-Einstein gas was also confirmed for real gases: at each temperature there is a maximum density at which condensation begins to occur, dividing the fluid into saturated gas and liquid. In real gases this maximum density is exactly correlated to the minima of the isotherms of the real factor Z which appear in the domain of the International Skeleton Table of water up to the 600 C isotherm. The pressure range (up to 1000 bar) is too low for the appearance of minima at higher temperatures. The domain of this table for water (pressure between 1 and 1000 bar; temperature between 200 and 800 C; specific density between 0.2 and 924 kg/cum) is well described. ESA

POTASSIUM-WATER REACTIONS IN THE VAPOR PHASE

Norbert Schwarz, Milos Komurka, and Hans Lichtl Jul. 1985 37 p In GERMAN; ENGLISH summary
(OEFZS-4327; RS-260/85; ESA-86-97065) Avail: NTIS HC A03/MF A01

The possible reactions of water leaking into a potassium condenser were investigated. The emphasis was on the development of pressure in the K-condenser and the expected reaction products. Theoretical considerations on possible reactions and reaction products, and the thermodynamics of K-reactions are given. The K-H2O reaction experiments are described. It is shown that water leakages into a potassium condenser are much less dangerous than expected on the basis of first estimations. The pressure increase is not only determined by the simple K-H2O reaction but also strongly by other reactions. The obtained maximum pressure is quickly reduced. For small continuous leaks an equilibrium is obtained. ESA

POTASSIUM INSTRUMENTATION AND EXPERIMENTS ON POTASSIUM VAPOR

Norbert Schwarz and Hans Lichtl Jul. 1985 19 p In GERMAN; ENGLISH summary
(OEFZS-4328; RS-261/85; ESA-86-97066) Avail: NTIS HC A02/MF A01

Temperature and pressure instrumentation for the investigation of potassium boiling phenomena were tested. In a small test rig thermocouples and a pressure transducer were tested in potassium at 870 C. A potassium vapor flame was generated by producing an artificial leak. The development of flame and aerosol was filmed. The measured data are qualitatively described. The vapor flame test confirms the good performance of the pressure measurement. The high rate of temperature changes does not allow a correct temperature measurement. The investigation of boiling phenomena thus requires directly immersed probes. ESA

IN SITU MONITORING OF ELECTROCHEMICAL REACTIONS BY SURFACE ENHANCED RAMAN SCATTERING Final Report, 1 Jul. 1983 - 31 Dec. 1985

Richard K. Chang and Victor E. Henrich Feb. 1986 45 p
(Contract GRI-5083-260-0795)
(PB86-201076; GRI-86/0054) Avail: NTIS HC A03/MF A01 CSCL 07D

Surface enhanced Raman scattering (SERS) was applied in investigating the nature of the water adsorbates and the protonation of Ag-oxides on Ag electrodes immersed in various electrolytes and undergoing oxidation-reduction cycles. The vibrational frequency of the O-D stretching mode of water adsorbates was determined for the two possible orientations (oxygen pointing away from or toward the Ag surface) and the two possible species (deuterium or hydrogen) on the other bond. To better quantify the SERS on metallic microstructures, e-beam lithography was used to produce microstructure arrays of uniform size, shape, and separation. The experimental studies on coinage metal surfaces provide information as to how SERS can be extended to catalytically more interesting metal surfaces. GRA

Utilization of the reducing capacity of gases during the complete reduction of partially metallized materials by solid carbon in an arc steel making furnace is examined. During heating, the layer of charge shrinks (compacts) under the pressure of the mass of charge materials lying above it. Results show that an increase in the fuel consumption raises the temperature at the start of shrinkage and simultaneously reduces the shrinkage range. B.G.

THE VARIATION OF CORROSION POTENTIAL WITH TIME FOR COATED METAL SURFACES
Merlin D. Danford and Ward W. Krockemus (Huntingdon Coll., Montgomery, Ala.) Sep. 1986 27 p
(NASA-TP-2636; NAS 1.60:2636) Avail: NTIS HC A03/MF A01 CSCL 11F

The variation of corrosion potential (EsubCORR) with time has been measured for 4130 steel coated with a preservative compound and for primer coated 2219-T87 aluminum. The data for coated steel samples show a great deal of scatter, and a smoothing procedure has been developed to enable proper interpretation of the data. The EsubCORR-time curves for coated steel exhibit a maximum, in agreement with the results of previous studies, where the data were the average of those for a large number of samples, while the present data were obtained from a single sample. In contrast, the EsubCORR-time curves for primer coated 2219-T87 aluminum samples show no significant variations, although considerable activity is indicated by the resistance-time and corrosion rate-time curves. MICROSTRUCTURE/PROPERTY RELATIONSHIPS FOR CARBON FIBER REINFORCED ALUMINUM ALLOYS Final Report
R. G. Dixon, J. A. Cornie, and M. C. Flemings 25 Jul. 1985 108 p
(Contract N00014-83-K-0677)
(AD-A165992) Avail: NTIS HC A06/MF A01 CSCL 11/6

Graphite fibers with various coatings were tested for strength. Longitudinal composites were produced from the coated fibers using pure aluminum as the matrix by pressure casting. The strength and microstructure of the composites was evaluated. Longitudinal and transverse composites were also produced using uncoated graphite fibers with various alloy matrices and their strength and microstructure evaluated. The coated fibers were leached from the pure aluminum matrix and examined. The uncoated graphite fibers were leached from the alloy matrices and tested for strength. The coated fibers were not found to be stronger than the uncoated fibers, nor were they effective in increasing composite strengths. Composites produced from uncoated fibers and alloy matrices were quite strong longitudinally with strengths of up to 93 percent of rule of mixtures strength. The same material, when tested in the transverse direction exhibited low strengths, with the failure being interfacial. Author (GRA)

FERROMAGNETIC RELAXATION IN ULTRATHIN FILMS OF AMORPHOUS ALLOYS Final Report, 15 Jul. 1985 - 15 Feb. 1986
George T. Rado 4 Apr. 1986 13 p
(Contract N00014-85-K-2027)
(AD-A166727) Avail: NTIS HC A02/MF A01 CSCL 11/6

It is suggested that the shielding effectiveness of devices designed for electromagnetic pulse (FMR) mitigation could be significantly improved by the use of ferromagnetic materials which are amorphous rather than crystalline. Prior to investigating ferromagnetic relaxation, i.e., magnetic losses, in such materials, it is necessary to understand ferromagnetic resonance field (or frequencies), especially for materials in the form of ultrathin films. In the present report this aim is accomplished by the development and use of a method which allows the first reliable measurement of magnetic surface anisotropy. GRA

COMPREHENSIVE CHEMICAL ANALYSIS OF METAL ALLOYS BY MEANS OF INDUCTIVELY COUPLED PLASMA OPTICAL EMISSION SPECTROSCOPY Interim Report, Oct. 1984 - Sep. 1985
W. E. Glad Oct. 1985 27 p
(AD-A166842; AD-E950814; NOSC/TR-1078) Avail: NTIS HC A03/MF A01 CSCL 11/6

The purpose of this study was to extend the analysis capability of inductively coupled plasma (ICP) optical spectroscopy to as many different copper, aluminum, and iron base alloys as possible, and investigate the development of analytical methods capable of determining all important elements in a particular base through the use of a single set of analytical lines and a single preparation method. Analyses of standard reference materials show that the analysis lines used were effective for determining those elements which can be brought into solution, particularly copper, chromium, cobalt, manganese, molybdenum, silicon, vanadium, and phosphorous. Other materials, notably aluminum, boron, titanium, niobium, tungsten, and zirconium in an iron base were more difficult to analyze, probably because they form carbides or other species that are difficult to dissolve. The uses of NaOH/H2O2 to dissolve aluminum base material and HC1/H2O2 to dissolve copper base material show promise as good comprehensive dissolution techniques. The conductive solids nebulizer (CSN) proved effectivein bypassing the dissolution step. GRA

THE EFFECT OF BAKING AND STRESS ON THE HYDROGEN CONTENT OF CADMIUM PLATED HIGH STRENGTH STEELS Progress Report
D. A. Berman Dec. 1985 24 p
(AD-A166869; NADC-86035-60) Avail: NTIS HC A02/MF A01 CSCL 11/6

Variations in the diffusible hydrogen concentration of cadmium plated AISI 4340 and 300M steels due to baking and stress are reported. Long baking times of greater than 100 hours at 190C are needed to remove all the hydrogen from bright cadmium plated specimens, and around 40 hours for dull cadmium plated ones. Very short baking not only does not remove hydrogen, but actually pumps it in. Baking for 96 hours is insufficient to remove hydrogen embrittlement from sharp, double notched 300M tensile specimens having a notched tensile strength of 1800 MPa. It is shown that there is not difference in the hydrogen concentration does not change with time for cadmium plated specimens standing for one month at room temperature. Stressing, on the other hand, causes an increase in the hydrogen, presumably by allowing it to enter from the plate due to lattice deformation. GRA

AN INVESTIGATION OF STRESS-CORROSION CRACKING SUSCEPTIBILITY IN CANDIDATE STEELS FOR TENSION LEG PLATFORM TENDONS Interim Report
J. A. Hauser, II and T. W. Crooker 24 Apr. 1986 15 p
(AD-A167286; NRL-MR-5773) Avail: NTIS HC A02/MF A01 CSCL 13/13

Consideration of the use of high-strength steels in tension leg platform (TLP) tendons raises questions concerning the possibility of stress-corrosion cracking (SCC) occurring over long periods of time. For this reason, an investigation was undertaken to experimentally characterize the SCC susceptibility of eleven candidate materials using state-of-the-art fracture mechanics methodology. The materials studied in this program were provided by Conoco, Inc. and Chevron Corporation from samples being characterized to TLP service. The materials included steels in various product forms including forgings, rolled plate and weldments with yield strengths ranging from 80 to 125 ksi. The SCC tests were conducted at the NRL Marine Corrosion Research Laboratory in Key West, Florida. Bolt-loaded wedge-opening-loaded precracked specimens were exposed to fresh flowing natural seawater while cathodically coupled to zinc anodes for a minimum of 8,000 hours (333 days). No evidence of SCC susceptibility was found in any of the materials tested. A limited number of additional experiments were conducted to further confirm this favorable finding. Static-load SCC does not appear to pose a threat to the structural integrity of high-strength steel TLP tendons. GRA

CORROSION FATIGUE OF ZIRCALLOY-4 IN CHLORIDE MEDIUM Tese (M.Sc.)
C. S. S. Monnerat 1984 86 p In PORTUGUESE; ENGLISH summary
(DE86-780339; INIS-BR-373) Avail: NTIS (US Sales Only) HC A05/MF A01

The fatigue behavior of Zircalloy-4 in a 0.5 M NaCl aqueous solution was studied. The tests were performed under potenciostatic control at room temperature and mean frequency of 80 Hz. The tests have shown that Zircalloy-4 does not have its fatigue life decreased under cathodic potentials action. The application of anodic potentials, however, has markedly influenced the life of the material. This influence is characteristic for a certain range of applied potential and cyclic stress level. It was shown that, for a maximum stress higher than yield stress and potential values higher than +120 mV sub(sce), the life of the material was drastically reduced due to pit formation and intergranular attack. This critical potential is, however, lower than the pit potential (approx. +180 mV sub(Sce)) obtained by the usual electrochemical methods. For maximum cyclic stress lower than the yield stress, the material did not fail even at potential values higher than the critical +120 mV sub(sce). The application of potential values lower than +120 mV sub(sce) led to an increase in the fatigue properties of the material, that is characterized by an increase in fatigue life as compared to that observed in air. This behavior is attributed to the high velocity of repassivation presented by Zircalloy-4. DOE

GRAIN BOUNDARY DISLOCATION STRUCTURES IN [001] SYMMETRIC TILT BOUNDARIES IN ALUMINUM
J. S. Liu and R. W. Balluffi Aug. 1985 20 p
(Contract DE-FG02-84ER-45116)
(DE86-007003; DOE/ER-45116/8) Avail: NTIS HC A02/MF A01

Grain boundary dislocation (GBD) structures were studied in (001) symmetric tilt boundaries in aluminum bicrystals of controlled geometry using transmission electron microscopy. The intrinsic GBD structure of near-(SIGMA)1, (SIGMA)5 and (SIGMA)13 boundaries consisted of families of straight edge GBDs with Burgers vectors b = <100> or 1/2<110>, 1/10<310> and 1/26-<510>, respectively. In each case the system chose GBDs with the smallest perfect Burgers vector perpendicular to the boundary in agreement with previous computer simulations using the method of molecular statics and a pairwise pseudo potential model. In addition, the b = <100> GBDs were straight and not serrated due to dissociations into partial GBDs and patches of stacking fault, as they are in gold according to earlier work. This result was attributed to the higher stacking fault energy of aluminum. Observations were also made of extrinsic GBD structures produced by the superposition of lattice dislocations on the intrinsic GBD arrays. The results were consistent with structures which could be obtained by a sequence of reactions in which each lattice dislocation dissociated into GBDs possessing Burgers vectors corresponding to the boundary DSC Lattice which then interacted in various ways with the intrinsic array. DOE

SENSITIVITY ANALYSIS OF A NUMERICALLY SIMULATED HgCdTe SOLIDIFICATION PROCESS BY STATISTICAL METHODS
M. Morris and V. Alexiades Feb. 1986 19 p
(Contract DE-AC05-84OR-21400)
(DE86-007935; ORNL-6210) Avail: NTIS HC A02/MF A01

Statistical response surface methodology is applied to the problem of determining simple approximations for outputs as functions of input parameter values in a numerical simulation of the solidification of a mercury-cadmium-telluride alloy. The approximating polynomials are then differentiated with respect to parameter values to determine sensitivities. A table of percent changes in output values as a result of 1% changes in parameter values is presented. The empirical procedure used constitutes an unorthodox application of the statistical methodology, but it is easy to use, quite generally applicable and very effective. DOE

CERTIFICATION OF CARBON, NITROGEN AND OXYGEN IN ZIRCALOY. (BCR NOS. 275 AND 276)
C. Vandecasteele, H. Marchandise, and E. Colinet 1984 38 p
(DE86-750679; EUR-9525) Avail: NTIS (US Sales Only) HC A03/MF A01

The experimental procedures for the certification of carbon, nitrogen, and oxygen in zircaloy are described. The samples were analyzed in different laboratories using the following analytical methods: combustion, photon activation analysis, and deuteron activation analysis for carbon; reducing fusion, Kjeldahl's method, photon activation analysis, and charged particle activation analysis for nitrogen; and reducing fusion, photon activation analysis, and charged particle activation analysis for oxygen. The analytical

methods and the statistical approach used to analyze the data are presented. Two materials available as samples with different dimensions were certified: BCR Nos. 275 and 276. The certified mass fractions and the uncertainties are given. DOE

MICROSTRUCTURE AND PROPERTIES OF FERROUS ALLOY WELDMENTS Progress Report, 1 Jan. 1985 - 31 Dec. 1985
D. L. Olson and D. K. Matlock 1985 70 p
(Contract DE-FG02-84ER-45066)
(DE86-008368; DOE/ER-45066/2) Avail: NTIS HC A04/MF A01
The microstructures and properties of new compositional grades of multipass austenitic weld metal for low and high temperature applications are being evaluated. Alloy modifications, which include substitutions for chromium, are being considered. Expressions for predicting as-solidified weld metal microstructures are being extended to include the effects of composition gradients. The effects of compositional and microstructural gradients on the thermal stability and mechanical properties of the modified austenitic weld metals is being evaluated in both single and multipass weldments. EFFECT OF NEUTRON IRRADIATION ON VANADIUM ALLOYS
D. N. Braski 1986 28 p Presented at the 2nd International Conference on Fusion Reactor Materials, Chicago, Ill., 13 Apr. 1986
(Contract DE-AC05-84OR-21400)
(DE86-009156; CONF-860421-18) Avail: NTIS HC A03/MF A01
Neutron-irradiated vanadium alloys were evaluated for their susceptibility to irradiation hardening, helium embrittlement, swelling, and residual radioactivity, and the results were compared with those for the austenitic and ferritic stainless steels. The VANSTAR-7 and V-15Cr-5Ti alloys showed the greatest hardening between 400 and 600(0)C while V-3Ti-1Si and V-20Ti had lower values that were comparable to those of ferritic steels. The V-15Cr-5Ti and VANSTAR-7 alloys were susceptible to helium embrittlement caused by the combination of weakened grain boundaries and irradiation-hardened grain matrices. Specimen fractures were entirely intergranular in the most severe instances of embrittlement. The V-3Ti-1Si and V-20Ti alloys were more resistant to helium embrittlement. Except for VANSTAR-7 irradiated to 40 dpa at 520(0)C, all of the vanadium alloys exhibited low swelling that was similar to the ferritic steels. Swelling was greater in specimens that were preimplanted with helium using the tritium trick. The vanadium alloys clearly exhibit lower residual radioactivity after irradiation than the ferrous alloys. DOE

OXIDATION/CORROSION BEHAVIOR OF LOW-CHROMIUM Fe-Cr-Ni ALLOYS CONTAINING ZIRCONIUM OF NIOBIUM
D. J. Baxter and K. Natesan Feb. 1986 22 p Presented at the 115th American Institute of Mining, Metallurgical and Petroleum Engineering Annual Meeting, New Orleans, La., 2 Mar. 1986
(Contract W-31-109-eng-38)
(DE86-008005; CONF-860340-1) Avail: NTIS HC A02/MF A01
Chromium is a vital constituent in many alloys and, as a general rule, at least 20 wt % Cr is required for the formation of protective scales on Fe-Cr-Ni alloys at temperatures up to 1000(0)C. However, in view of the strategic nature of Cr, it is desirable that new alloys with lower Cr contents be developed in order that the overall demand for Cr can be reduced. To address this requirement, a new series of Fe, 12% Cr, 8 to 12% Ni alloys containing Zr or Nb has been designed. Zirconium or Nb concentrations of up to 6 wt % were used to compensate for the low Cr contents, with the aim of providing oxidation/corrosion resistance comparable to that of commercial alloys containing in excess of 20% Cr. Experimental results show that at a high p/sub O2/, 1% Zr or Nb is sufficient to promote protective oxidation behavior, whereas at a low p/sub O2/, more than 3% of the quaternary addition may be required. In mixed-oxidant (O2/S2) environments, Zr and Nb reduce both scaling rates and internal penetration of aggressive elements from the exposure environments. DOE

CHLORIDE STRESS CORROSION CRACKING OF INSULATED AUSTENITIC STAINLESS STEEL: SOLAR HEATING CONSIDERATIONS
J. J. Peters and C. F. Jenkins 1986 21 p Presented at the Corrosion '86, Houston, Tex., 17 Mar. 1986
(Contract DE-AC09-76SR-00001)
(DE86-008907; DP-MS-85-2; CONF-860304-6) Avail: NTIS HC A02/MF A01
Chloride stress corrosion cracking (CSCC) of insulated pipe systems is discussed, and sources of chloride ions, moisture, and temperature increases in an industrial environment are considered. A recent CSCC failure of above-ground insulated austenitic stainless steel piping at the Department of Energy's Savannah River Plant (SRP) prompted investigation of the subject. Tests were run to establish pipe surface temperatures and temperature variations beneath thermal insulation during normal operation and under idle conditions. The effects of temperature on the pipe surface by sustained solar heating and unregulated electrical heat tracings were determined. The surface temperatures exceeded 54(0)C (130(0)F) on a sunny summer day. SRP design requires consideration of CSCC at 40(0)C (104(0)F), prompting the need for preventive methods to avoid failure above 40(0)C whenever stainless steel and chlorides occur simultaneously. Recommended preventive techniques are discussed. DOE

EVALUATION OF FACTORS AFFECTING THE ANALYSIS OF METALS USING LASER-INDUCED BREAKDOWN SPECTROSCOPY
D. A. Cremers and D. J. Romero 1986 7 p Presented at the SPIE Technical Symposium on Applications of Artificial Intelligence, Orlando, Fla., 31 Mar. 1986
(Contract W-7405-eng-36)
(DE86-008726; LA-UR-86-837; CONF-860366-4) Avail: NTIS HC A02/MF A01
Some of the main factors affecting the analysis of solid steel using laser-induced break-down spectroscopy (LIBS) have been investigated and are reported here. Pulses from an electro-optically Q-switched Nd:YAG laser were focused on steel samples to generate a high temperature plasma. The spectrally resolved plasma light was time resolved and detected using a photodiode array. The effects that changes in the lens-to-sample distance, laser pulse energy, and position of the imaging lens had on the LIBS analysis are described. These effects were minimized by ratioing the absolute element signals to adjacent Fe-lines. Calibration curves for Mn, Si, and Cr are presented and the accuracy and precision of LIBS analysis listed for several elements. DOE

DYNAMIC RECRYSTALLIZATION DURING HIGH TEMPERATURE LOW CYCLE FATIGUE OF NICKEL Progress Report, 1 Jun. 1985 - 31 May 1986
G. Gottstein Jan. 1986 32 p
(Contract DE-FG02-85ER-45205)
(DE86-009010; DOE/ER-45205/1) Avail: NTIS HC A03/MF A01
The occurrence of dynamic recrystallization in single and

polycrystals under nonmonotonic loading conditions was investigated. Intermediate annealing, load inversion or changing the strain path facilitates dynamic recrystallization. Low cycle fatigue in the elastic regime has about the same effect as static recovery for the same time period. Invariably, the initiation of dynamic recrystallization is controlled by dynamic recovery, as indicated by a constant ratio sigma(sub R)/sigma(sub S). During low-cycle fatigue at 0.5 Tm with 1% plastic strain amplitude, dynamic recrystallization can be initiated at much lower stresses than in monotonic tests, but recrystallization progresses much more slowly. The static recrystallization behavior of rolled Ni3Al was investigated to establish the conditions for the occurrence of dynamic recrystallization in this material. DOE

N86-30856# Oak Ridge National Lab., Tenn.
MECHANICAL PROPERTY MEASUREMENTS ON ION-IRRADIATED METALS
S. J. Zinkle and W. C. Oliver 1986 22 p Presented at the 2nd International Conference on Fusion Reactor Materials (ICFRM-2), Chicago, Ill., 13 Apr. 1986
(Contract DE-AC05-84OR-21400)
(DE86-009147; CONF-860421-20) Avail: NTIS HC A02/MF A01

A recently developed mechanical microprobe (MPM) has been used to investigate strength and elastic modulus changes in ion-irradiated metals. The indenter load and its displacement are simultaneously monitored while the indentation is being made and also during unloading. Microhardness measurements have been performed on ion-irradiated copper and Cu-O.15% Zr (AMZIRC). The depth dependence of the ion damage has been investigated in selected specimens which were prepared using a cross-section technique. This procedure allows a direct comparison to be made of microhardness data from different irradiation depths while the indent size held constant. The displacement damage associated with ion irradiation caused either hardening or softening, depending on the irradiation conditions and the material. DOE

STUDY OF THE POLARIZATION FOR INCOLOY 800 AND FOR THE STAINLESS STEEL AISI 304 IN MIXTURES OF IRON, NICKEL AND CHROMIUM CHLORIDES
A. M. Travalloni, L. Sathler, and O. R. Mattos 1985 10 p In PORTUGUESE Presented at the 12th National Seminar on Corrosion, Salvador, Brazil, 13 May 1985
(DE86-701576; INIS-BR-432; CONF-8505227-3) Avail: NTIS (US Sales Only) HC A02/MF A01

Polarization curves for the Incoloy 800 and for the stainless steel AISI 304 were obtained with static and rotational electrodes. The electrolytes employed showed growing concentrations of mixtures as iron, nickel and chromium chlorides their proportion being the same as the content of these elements in the respective alloys. The alloys under investigation exhibited a continuous transition behavior from the passive to the active-passive and to the active conditions. Also, the pH was found to be the main parameter controlling the anodic behavior of the alloy. DOE

EVALUATION OF THE CORROSION OF ALUMINUM TUBES UNDER CONDITIONS OF NATURAL IMMERSION IN AQUEOUS MEDIUM
M. F. de Oliveira 1985 14 p In PORTUGUESE Presented at the 12th National Seminar on Corrosion, Salvador, Brazil, 13 May 1985
(DE86-701579; INIS-BR-430; CONF-8505227-4) Avail: NTIS (US Sales Only) HC A02/MF A01

This work evaluates the corrosion of aluminum tubes under conditions of natural immersion in aqueous medium. Local attack was observed on the surface of the tubes for all temperatures studied. It was found that the mass fluctuation of the samples tested in deionized water at room temperatures is practically inexistent. However, at temperatures of 45 and 60(0)C the aluminum react rapidly with water forming a film of hydrated oxide of aluminum known as bayerite. It was verified that the contact of graphite and particles containing high content of Cu with aluminum forms a galvanic couple which should be avoided. DOE

N86-30860# Commission of the European Communities (Luxembourg).
PROPERTIES OF POINT DEFECTS IN METALS AND ALLOYS
W. Schuele 1984 26 p In FRENCH Prepared in cooperation with Commission of the European Communities, Ispra, Italy
(DE86-780413; EUR-9451) Avail: NTIS (US Sales Only) HC A03/MF A01

Experimental results, both old and new, are discussed and interpreted. It is shown in a straightforward way that the properties of point defects are completely different from those commonly assumed during the last 25 years. The properties of interstitials, vacancies and divacancies of some pure metals are listed and those of some alloy materials are given in the context of the paper. The corresponding radiation damage model is called the modified two-interstitial model, which develops from the two interstitial model. On the basis of the new radiation damage model structural changes observed in stainless steel alloys and the value of simulation experiments in fusion reactor technology are discussed. DOE

ANALYSIS OF THE TOUGHNESS CHARACTERISTICS OF CRYOGENIC 9% NICKEL STEELS Final Report, Jul. 1984 - Nov. 1985
R. D. Stout and S. K. Tarby Jan. 1986 37 p
(Contract GRI5080-352-0322)
(PB86-196144; GRI-86/0002) Avail: NTIS HC A03/MF A01 CSCL 11F

A statistical analysis of the Charpy notch toughness exhibited by production heats of 9% nickel steels as affected by the year of manufacture and compositional variations has been performed. Data from more than 600 heats show a notable increase in notch toughness during the past 15 years and a level of performance far superior to minimum requirements of ASTM standards. A multiple regression analysis indicated that much of the improvement has been attained by lowering the sulfur and carbon contents of the steel. The unexplained variance of notch toughness may be due to effects of heat treatment, the within-heat scatter, and composition variables that lay outside the data available for analysis. Doubling the required minimum Charpy notch toughness appears feasible without hardship to steel producers but with an enhancement of the reliability of LNG storage tanks. GRA

SPACE STATION MOLECULAR SIEVE DEVELOPMENT Final Report
Craig Chang (Signal Research Center, Inc., Des Plaines, Ill.) and Jean Rousseau 1 May 1986 59 p
(Contract NAS8-36424)
(NASA-CR-178885; NAS 1.26:178885; Rept-86-30002) Avail: NTIS HC A04/MF A01 CSCL 07B

An essential function of a space environmental control system is the removal of carbon dioxide (CO_2) from the atmosphere to control the partial pressure of this gas at levels lower than 3 mm Hg. The use of regenerable solid adsorbents for this purpose was demonstrated effectively during the Skylab mission. Earlier sorbent systems used zeolite molecular sieves. The carbon molecular sieve is a hydrophobic adsorbent with excellent potential for space station application. Although carbon molecular sieves were synthesized and investigated, these sieves were designed to simulate the sieving properties of 5A zeolite and for O_2/N_2 separation. This program was designed to develop hydrophobic carbon molecular sieves for CO_2 removal from a space station crew environment. It is a first phase effort involved in sorbent material development and in demonstrating the utility of such a material for CO_2 removal on space stations. The sieve must incorporate the following requirements: it must be hydrophobic; it must have high dynamic capacity for carbon dioxide at the low partial pressure of the space station atmosphere; and it must be chemically stable and will not generate contaminants. B.G.

(AD-A166150; UMASS-5-28246; AFOSR-86-0132TR) Avail: NTIS HC A02/MF A01 CSCL 11/9

Substantial progress was made in both experimental and theoretical elements. First, procedures were devised to synthesize: (1) sulfonated polysulfone with a controlled and reproducible structure, (2) sulfonated polyaryletheretherketone with less than 30% sulfonation that has potential as a new high-temperature ionomer, and (3) polyaryletherketone-co-ethersulfone made by a novel ether interchange. Blending studies centered on copolyester LCP's and polybenzimadazole/polyimide combinations. The latter are rendered compatible through specific interaction but which can be phased separated. This finding could result in greatly enhanced opportunities for the use of PBI resins. The major objectives with the LCP blends was to define criteria for miscibility and to improve their processability. Theoretical research was conducted on both LCP/LCP and random coil blends. Particularly important was work on the effect of sequence distribution on phase behavior in random coil blends. A model, containing an ordering parameter, successfully explained the special case of a random/alternating copolymer of the same composition. GRA

PHASE RELATIONS AND MISCIBILITY IN POLYMER BLENDS CONTAINING COPOLYMERS
R. J. Roe and D. Rigby 15 Apr. 1986 82 p
(Contract N00014-85-K-0245)
(AD-A166773; TR-4) Avail: NTIS HC A05/MF A01 CSCL 07/4

This article reviews the reported work on thermodynamics of polymer blends in which at least one of the components is a copolymer. Theoretical and experimental studies of miscibility and phase transition and separation behaviors in such systems are summarized. Chapter 2 deals with blends involving random copolymers, including the cases in which a random copolymer AB is mixed with either a homopolymer A, or a homopolymer C, or two homopolymers A and B. Chapter 3 deals with blends involving a block copolymer, and after giving a brief overview of systems containing a pure block copolymer alone, it reviews the blend systems containing a block copolymer AB mixed with a homopolymer A or two homopolymers A and B. A new nuclear magnetic resonance (NMR) method for measuring the crystallization kinetics of polymers under high pressure, sensitive on a molecular scale to the dynamics of chain motion, was developed. The very rapid formation of extended chain crystals of polyethylene was directly observed. The techniques has much promise for future experiments including polymer crystallization, melting and annealing. Polarization microscopy and NMR experiments on various alkali salts of alkalicarboxylates elucidated the dynamic structure of these interesting ionic liquid crystalline materials. Experiments on highly viscous liquids explained the origin of the anomalous discontinuity observed in the temperature dependence of the shear viscosity of glass forming liquids. Molecular level interpretation of the coupling between translational and rotational motions in viscous liquids was achieved. The Debye and Stokes-Einstein equations were found to be applicable at the molecular level in viscous liquids. Volume effects were shown to be important for dynamics of viscous liquids. GRA

MOLECULAR MECHANICS OF SUBMICRON THIN MONOMERIC AND POLYMERIC MOLECULAR FILMS Final Report, 30 Jul. 1984 - 29 Jul. 1985
Paras N. Prasad 31 Mar. 1986 6 p
(Grant AF-AFOSR-0281-84)
(AD-A167277; AFOSR-86-0228TR) Avail: NTIS HC A02/MF A01 CSCL 11/9

This grant, through the DOD-University Instrumentation program, was provided to acquire a picosecond laser system for the study of non-linear optical effects as well as for structural characterization of submicron films. The laser system consists of a CW mode-locked Nd-Yag laser (Spectra-Physics, Model 300), the output of which, after frequency doubling, is split by a 50% beam splitter to sync pump two dye lasers (Spectra-Physics, Model 375). The outputs from these dye lasers are fed into two amplifiers (Quanta Ray, Model PDA) which are pumped by the second harmonic of a 20Hz pulsed Nd-Yag laser (Quanta-Ray, Model DCR-2A). the amplified pulses are 7ps wide with 0.5MJ of pulse energy. The laser system has proven to be extremely versatile and, therefore, valuable for a number of different experiments. This arrangement also gives us the choice to generate tunable picosecond u.v. and IR pulses by mixing either of two dye laser beams with the fundamental from the pulse Yag laser. GRA

LIFETIME PREDICTION OF ORGANIC COATING/METAL SYSTEMS Final Report, 1 Jul. 1979 - 31 Oct. 1985
F. Mansfeld and M. Kendig Apr. 1986 97 p
(Contract N00014-79-C-0437)
(AD-A167281; SC5222.FR) Avail: NTIS HC A05/MF A01 CSCL 11/3

A lifetime prediction model has been developed for polymer coating/metal systems. The elements of the model fall into the category of system variables that describe the surface of the substrate, the coating or the environment, or the category of processes that determine the degradation of the coated metal. These processes include formation of defects in the coating and at the metal/coating interface, transport of corrosive species to the metal, loss of adhesion, corrosion and failure. The casual relationship between system variables and processes has been discussed. The lifetime prediction model is based on a series of experimental studies which have been performed during the course of this project. A number of new techniques have been developed which can be used to determine the properties of the coating/metal compound and its changes during interaction with corrosive environments. Electrochemical impedance spectroscopy (EIS) has been found to be very valuable in providing information concerning the coating and the metal surface and degradation of the coatings as corrosion proceeds. An acoustic pulse technique has been used to detect areas of delamination and corrosion. Acoustic emission from coated steel during straining of the sample has provided characteristic fingerprints for surface and coating properties and has demonstrated the importance of the mechanical properties of the coating. ASSESSMENT OF THE APPLICATION OF THE SPUTTERING PROCESS TO BERYLLIUM FOR HARDENING OPTICAL COATINGS
C. W. Chen and C. S. Alford 11 Nov. 1985 13 p
(Contract W-7405-eng-48)
(DE86-006656; UCID-20601) Avail: NTIS HC A02/MF A01

Two principal deposition processes are compared for the case of depositing 1 to 2 microns beryllium on fused-silica substrates. While the evaporation-deposition process offers advantages such as higher deposition rate, purification of the evaporant and efficient use of masks, the sputter-deposition is more versatile, and therefore more effective, in varying and controlling the microstructure of the deposits. The versatility comes about because the latter process has five major operational parameters to be selected or adjusted. Consequently, sputter-deposited beryllium films are expected to display more desirable microstructures and better surface finish than evaporation-deposited films. DOE

CORROSION OF SiC CERAMICS IN SYNTHETIC COMBUSTION ATMOSPHERES CONTAINING HALIDES
J. I. Federer, J. M. Robbins, P. J. Jones, and C. Hamby, Jr. Dec. 1985 27 p
(Contract DE-AC05-84OR-21400)
(DE86-006732; ORNL-6258) Avail: NTIS HC A03/MF A01

Corrosion of SiC ceramics has occurred in several industrial furnace environments. Halides derived from fluxes in aluminum remelt furnaces have been suspected to be responsible for corrosion in those furnaces. The present work involved exposure of SiC ceramics to synthetic combustion atmospheres (SCA) in laboratory furnaces to determine if halide species cause corrosion and, if so, to determine the corrosion mechanism. Specimens were exposed to SCA containing HCl, NaCl, and NaF at 1200 C for approximately 1000 h each. Exposure to SCA-HCl resulted only in small weight and dimensional increases similar to those occurring during air oxidation. However, exposure to SCA-NaCl and SCA-NaF resulted in significant corrosion characterized by weight losses and formation of glassy coatings. The coatings, which consisted mainly of SiO2, also contained Na2O and other metallic oxides. The Si content of SiC lost by corrosion far exceeded the Si content of the coatings, which suggested that other Si species formed during corrosion. The corrosion mechanism inferred from the results and from thermodynamic free energies of reaction involves formation of volatile Si halides. Direct evidence for formation of Si halides, however, was not found. Flexure strengths at 1100 C (with corrosion products intact) were not significantly decreased relative to unexposed specimens. In fact, strengths increased in some cases even though tensile surfaces were roughened by corrosion. DOE

PLATINUM PARTICLES IN THE Nd:DOPED DISKS OF PHOSPHATE GLASS IN THE NOVA LASER
D. Milam, C. W. Hatcher, and J. H. Campbell 20 Feb. 1986 19 p Presented at the Boulder Damage Symposium, Boulder, Colo., 15 Oct. 1985
(Contract W-7405-eng-48)
(DE86-007119; UCRL-93253; CONF-8510101-6) Avail: NTIS HC A02/MF A01

The disks of Nd:doped phosphate glass in the amplifiers of the Nova laser contain platinum particles with sizes ranging from less than 5 (MU)m (detection limit) to about 100 (MU)m. The particle density varies from about 0.01 to 1.0 cm(-3). These particles cause fractures when irradiated at fluences greater than 2.5 J/cm(2) delivered in 1-ns, 1054-nm pulses. Under repeated irradiation at 5 to 7 J/cm(2), damage from small (less than 5 (MU)m) particles asymptotically approaches a limiting size, but damage surrounding the larger particles grows steadily. The damage threshold fluence, 2.5 J/cm(2), corresponds to operation of Nova at one-half the desired output for pulse durations longer than 1 nsec. Operation at higher fluences causes accumulation of damage in the output amplifiers and requires replacement of the disks in those amplifiers on an accelerated schedule. DOE

EFFECT OF SURFACE CORROSION ON GLASS FRACTURE
B. C. Bunker and T. A. Michalske 1985 21 p Presented at the 4th International Symposium on the Fracture Mechanics of Ceramics, Blacksburg, Va., 8 Jun. 1985
(Contract DE-AC04-76DP-00789)
(DE86-008404; SAND-86-0582C; CONF-8506128-4) Avail: NTIS HC A02/MF A01

The nature of aqueous corrosion reactions on glass surfaces varies with glass composition and environmental conditions. We have shown how the physical effects of the various surface reactions can be incorporated into simple fracture mechanics models to predict measured crack velocity effects in silicate glasses. Reactions on glass surfaces are divided into four categories; bond rupture reactions, alteration layer formation, surface deposition, and intermolecular surface forces. These results demonstrate the effect of chemical reaction mechanisms on the long-term mechanical behavior of glasses. DOE

RAMAN SCATTERING ANALYSIS OF THIN-FILM COATINGS USING GUIDED WAVES
Alan F. Stewart, David R. Tallant (Sandia National Labs., Albuquerque, N. Mex.), and K. L. Higgins 1985 20 p Presented at the 17th Annual Symposium on Optical Materials for High-power Lasers, Boulder, Colo., 28 Oct. 1985 Prepared in cooperation with Air Force Weapons Lab., Kirtland AFB, N.M.
(Contract DE-AC04-76DP-00789)
(DE86-008776; SAND-85-2076C; CONF-851052-5) Avail: NTIS HC A02/MF A01

Selected refractory-oxide, thin-film coatings were analyzed using Raman spectroscopy. Diamond and rutile prisms were used to couple the probe beam into the thin-film coatings which served as waveguides. Propagation of the probe beam as a guided wave in the thin film increases the probability for Raman scattering by species in the thin film compared to techniques which depend on a single pass through or probe beam reflection at the film. Because the probe beam is confined entirely within the thin-film coating, Raman spectra are obtained which are generally free of vibrational bands due to the substrate. The combination of of more efficient coupling between the probe beam and the thin film and the elimination of substrate interferences results in improved sensitivity and the ability to record recognizable Raman spectra of thin films composed even of materials that are relatively inefficient Raman scatters. JOINING OF CERAMICS FOR HIGH TEMPERATURE APPLICATIONS
M. Vilpas Aug. 1985 37 p In FINNISH
(DE86-751572; VTT-TIED-481) Avail: NTIS (US Sales Only) HC A03/MF A01

The report summarizes a literature survey of the methods for joining ceramics to ceramics or ceramics to metals for high temperature applications. Also mechanical properties and potential applications of the joints are considered. The joining of ceramics is usually carried out by brazing or diffusion bonding. Especially the letter has been found useful and increased the applications of joined ceramics. Recently also the possibilities to use electron beam and laser beam welding for joining of ceramics have been investigated. The joining of ceramics has found numerous applications, typical for high operating temperatures being different sensors and thermocouples. DOE

WETTING AND DISPERSION IN CERAMIC/POLYMER MELT INJECTION MOLDING SYSTEMS
M. D. Sacks, J. W. Williams, and C. D. Batich Nov. 1985 11 p
(Contract DE-FG05-85ER-45202)
(DE86-009001; DOE/ER-45202/1) Avail: NTIS HC A02/MF A01

The major goal of this program is to achieve an improved understanding of the factors influencing dispersion of ceramic particles in polymer melts. In general, there are three requirements in the dispersion of a powder in a liquid medium (e.g., a polymer melt): (1) wetting of the powder by the liquid; (2) breaking up powder agglomerates; and (3) maintaining the dispersed state (e.g., avoiding particle coagulation). Work has been initiated in each of these areas. Preliminary results are described. DOE

STRESS RELAXATION OF CELLULAR SILICONE MATERIAL: 1984
J. W. Schneider Mar. 1986 22 p
(Contract DE-AC04-76DP-00613)
(DE86-009131; BDX-613-3420) Avail: NTIS HC A02/MF A01

The long-term (10 years) stress relaxation properties of cellular silicone materials at room temperature are under evaluation. Both equilibrium (random copolymer) and condensation (block copolymer) type base polymers are included. The equilibrium-type material used urea as the leachable filler, and the condensation-type material used ammonium chloride. Each material was compounded to yield densities of 0.34 and 0.52 g/cm(3) for thicknesses of 1.17, 1.52, and 2.54 mm. These density-thickness combinations were compressed to nominal compressions of 20 and 40% with nine replicates at each condition. A specially designed fixture was used to maintain a specific compression on the cellular sample, and a universal test machine acquired the load data. Currently, the predicted load retention is between 60 and 68% of the original load. DOE

NEEDS ASSESSMENT FOR NONDESTRUCTIVE TESTING AND MATERIALS CHARACTERIZATION FOR IMPROVED RELIABILITY IN STRUCTURAL CERAMICS FOR HEAT ENGINES
D. R. Johnson, R. W. McClung, M. A. Janney, and W. M. Hanusiak 1986 8 p Presented at the 2nd International Symposium on Ceramic Materials and Components for Engines, Luebeck-Travemuende, West Germany, 14 Apr. 1986
(Contract DE-AC05-84OR-21400)
(DE86-010039; CONF-860413-2) Avail: NTIS HC A02/MF A01

A general ceramic processing flowsheet and inspections at each stage of the flowsheet are shown. The inspections shown identified as potentially important from the point of view of the development of highly reliable ceramics. The inspections shown were all considered in the assessment of the relative priorities for development of inspection techniques. It is anticipated that a limited number of key inspections will be identified for any given product

line. This paper reviews the status and needs for inspections in raw materials, green bodies, and dense ceramics. DOE

ANTIMISTING FUEL RESEARCH AND DEVELOPMENT FOR COMMERCIAL AIRCRAFT Final Report
Michael Yaffee Apr. 1986 78 p
(FAA/CT-86/7) Avail: NTIS HC A05/MF A01

This report covers the research, development, testing, and evaluation conducted by the Federal Aviation Administration (FAA) in pursuit of an effective, feasible antimisting agent for kerosene jet fuels that would prevent or reduce the dangers of postcrash, fuel mist fires. For the past eight years, most of this effort was focused on a high molecular weight polymer, FM-9 (Trademark), as a representative agent to prove the antimisting fuel concept. The results of this work indicate that the goal is achievable: Jet fuel can be modified to provide a significant degree of protection against postcrash fires in impact-survivable accidents. Additional development and testing would be required before the fuel is operationally acceptable. It would be necessary to make some modifications in fuel handling procedures and hardware in aircraft and at airports. But there appear to be no technically insurmountable problems. Author

REVIEW ON COMPRESSION IGNITION SENSITIVITY STUDIES OF LIQUID GUN PROPELLANTS
John D. Knapton and Eberhard Schmolinske Mar. 1986 31 p
(AD-A165969; BRL-MR-3497) Avail: NTIS HC A03/MF A01 CSCL 21/2

Most of the past work on the compression ignition sensitivity of liquid gun propellants did not succeed in elucidating the fundamental processes involved in compression ignition. Existing theoretical predictions rely on simplifying assumptions and remain unvalidated until appropriate experimental investigations are made. Recent experimental studies have focused on safety aspects and have tried to define reaction limits based on the ullage present, the bubble size, and the pressurization rate resulting in go or no-go type of tests. Many of the tests have revealed, for cases where a compression ignition event was observed, a finite induction time before there is a significant pressure generation. There are five theoretical mechanisms (hot spot, impact (micro-jetting), chemical, cooperative effects, and oscillations) which may be involved during the ignition of a pressurized bubbly Lp and it is difficult to say which is the right one. Moreover, if one succeeds in discovering the mechanisms for ignition, adiabatic compression could be considered as a practical ignition source for a liquid propellant gun. Another important unknown in all of the adiabatic compression tests conducted to-date is the amount of dissolved gas in the propellant. For future tests, therefore, gas solubility measurements should be considered. GRA

DESCRIPTIVE CHARACTERIZATION OF SOLID INGREDIENTS Interim Report, Oct. 1984 - Feb. 1986
K. G. Chandler and P. C. Trulove Mar. 1986 17 p
(AD-A166874; AFRPL-TR-86-016) Avail: NTIS HC A02/MF A01 CSCL 21/9

Presently weight median diameter measurements are used to correlate oxidizer particle size to ballistic performance in solid propellants. Propellant burning is a heterogenous process that is greatly influenced by available surface area of oxidizer particles. Weight median diameter measurements do not accurately reflect the available oxidizer surface area so there are inherent errors in burn rate correlations. This study focuses on the development of a new oxidizer particle characterization technique that is surface dependent to improve accuracy in correlating oxidizer particles to ballistic performance. VEGETABLE OILS AS DIESEL FUELS. REDUCTION OF CARBON FOULING
M. Kytoe, N. O. Nylund, and K. Sipilae Jun. 1985 44 p In FINNISH; ENGLISH summary
(DE86-750610; VTT-TIED-464) Avail: NTIS (US Sales Only) HC A03/MF A01

It is accepted that vegetable oil is fairly well suited as fuel for diesel engines in short-term use. Good results have also been obtained in long-term experiments with precombustion chamber diesels. In direct-injection diesel engines heavy carbon fouling often causes problems. In the experimental part of the research work the ability of certain additives to reduce fouling was studied on a direct-injection Petter AVB engine in a 20 h test. A mixture consisting of 50% diesel oil and 50% alkali refined rape oil was used as the fuel. Additives rated effective according to literature references did not reduce fouling in these experiments, whereas fairly good results were obtained using an ignition improver. DOE

HYDROGEN STORAGE SYSTEM Interim Report
W. B. Retallick 18 Feb. 1986 8 p
(Contract DE-FG01-85CE-15230)
(DE86-006990; DOE/CE-15230/T1) Avail: NTIS HC A02/MF A01

Hydrogen can be stored in the form of a metal hydride. The formation of the hydride is highly exothermic. Hence the rate at which hydrogen can be added to or removed from the storage system is limited by the rate of heat transfer. Heat transfer is facilitated by displaying the hydride on a metal support that conducts heat. The task was to find a binder to make hydride stay put on a metal support through at least 250(0) cycles of hydriding-dehydriding and to measure the rate of hydrogen uptake. DOE

ELECTRONIC SIMULATOR AND CALIBRATOR FOR ELECTROTHERMAL RESPONSE TEST SYSTEMS
Larry M. Moore, Arnold C. Strasburg, and James J. Spates (Ktech Corp., Albuquerque, N. Mex.) Feb. 1986 26 p
(Contract DE-AC04-76DP-00789)
(DE86-008874; SAND-85-2259) Avail: NTIS HC A03/MF A01

The electrothermal response (ETR) test is performed on electroexplosive devices (EED). A device is described which simulates these EED's. The simulator generates a voltage analog which varies exponentially with time and has an amplitude which is proportional to the third power of the input current. This exponential response is superimposed on a square wave analog which simulates the constant voltage drop across the cold

resistance of a bridgewire. Also described is a calibrator for ETR testers. The calibrator generates a known change in resistance for determining the response of a system under test. DOE

FIRE EXTINGUISHING AGENTS FOR OXYGEN-ENRICHED ATMOSPHERES Final Report, 1 Apr. 1982 - 30 Nov. 1985
Martin A. Plugge, Christopher W. Wilson, Dennis M. Zallen, and Joseph L. Walker Dec. 1985 98 p
(Contract F29601-81-C-0013)
(AD-A166967; NMERI-TA3-19; ESL-TR-85-26) Avail: NTIS HC A05/MF A01 CSCL 13/12

Fire-suppression agent requirements for extinguishing fires in oxygen-enriched atmospheres were determined employing small-, medium-, large-, and full-scale test apparatuses. The small- and medium-scale tests showed that a doubling of the oxygen concentration required five times more HALON for extinguishment. For fires of similar size and intensity, the effect of oxygen enrichment of the diluent volume in the HC-131A was not as grate as in the smaller compartments of the B-52 which presented a higher damage scenario. The full-scale tests showed that damage to the airframe was as important a factor in extinguishment as oxygen enrichment. GRA

THEORETICAL MODELS OF SINGLE-ELEMENT LTSA ANTENNA ELEMENTS
In its Near Millimeter Wave Imaging/Multi-Beam Integrated Antennas 1986 53 p (For primary document see N86-30891 22-32)
Avail: NTIS HC A04/MF A01 CSCL 20N

The spectral domain computations for slotline guide wavelength and characteristic impedance provide the basic parameters that are need to calculate the radiation pattern of an Linearly Tapered Slot Antenna (LTSA) by using the half-plane Green's function and a stepped approximation to the LTSA structure. However, the spectral domain computations are somewhat time consuming and not suitable for computer aided design application. Therefore, the results of several computation were fitted by formulas that are readily evaluated on a calculator or computer. Antenna measurements were continued, and an attempt was made to predict the truncation effect by three different methods. B.G.

MAGNETOSTATIC WAVE APPLICATION TO MICROWAVE ANALOG SIGNAL PROCESSING
Paolo DeGasperis (Consiglio Nazionale delle Ricerche, Rome, Italy), Carlo DiGregorio, Giuseppe Miccoli, and Riccardo Roveda *In its* Rivista Tecnica Selenia, v. 9, no. 4, 1985 p 18-25 (For primary document see N86-30894 22-32)
Avail: NTIS HC A03/MF A01

The physical principles underlying the operation of magnetostatic wave (MSW) devices are presented, and developments and applications are outlined. The technique promises direct handling at microwave frequencies (0.5 to 20 GHz) thanks to the control of the propagation of MSW in thin magnetic garnet films grown by liquid phase epitaxy. ESA

AN EXAMPLE OF INTEGRATED LOGISTIC SUPPORT APPLIED ALSO TO PRODUCTION TESTING
Vincenzo Buontempo *In its* Rivista Tecnica Selenia, v. 9, no. 4, 1985 p 26-45 (For primary document see N86-30894 22-32)
Avail: NTIS HC A03/MF A01

The basic concepts of an aerospace industry integrated logistic support plan are presented. An example shows that as well as achieving overall economy on system life cycle support cost, it reduces production costs by designing support means and production test in harmony with the logistic support means. A life cycle computation model related to the logistic support is provided. The model is also applicable to on board avionic systems such as Tornado and AMX aircraft and EH 101 helicopter. ESA

A GaAs BASED DIGITAL SERIAL COMMUNICATIONS SYSTEM Final Report
Ramon Zulaybar delRosario 25 Mar. 1986 106 p
(AD-A166060) Avail: NTIS HC A06/MF A01 CSCL 17/2

Described are the design and simulation of a one gigabit per second synchronous transmitter and receiver system. The circuitry is to be integrated on a 32-pin gallium arsenide semicustom digital gate array. Digital logic components are built using enhancement and depletion mode n-channel metal-semiconductor field-effect transistors. The computer simulations indicate that, under a one micron gate process technology and using a 2V voltage supply, inverter propagation delays as small as 60 picoseconds can be achieved. Designs for both the transmitter and the receiver have been successfully simulated at the one gigahertz clock rate. GRA

COMPARISONS OF 76Hz TRANSVERSE AND RADIAL MAGNETIC FIELD STRENGTH COMPONENTS RECEIVED IN CONNECTICUT
Peter R. Banniister 11 Mar. 1986 145 p
(AD-A166548; NUSC-TD-7523) Avail: NTIS HC A07/MF A01 CSCL 20/14

Since June 1970, we have made extremely low frequency (ELF) measurements of the transverse horizontal magnetic field strength, H sub phi, received in Connecticut. Occasionally, we also have measured either the vertical electric field strength, E sub v, or the radial horizontal magnetic field strength, H sub rho. The AN/BSR-1 ELF receivers are located at the Naval Underwater Systems Center (NUSC), at New London, CT. The transmission source for these farfield (1.6-Mm range) measurements is the U.S. Navy's ELF Wisconsin Test Facility (WTF), located in the Chequamegon National Forest in north-central Wisconsin. The results of 136 days of radial magnetic field measurements taken from November 1977 through June 1984 are discussed in this report. The main result is that during disturbed propagation conditions, the radial and transverse magnetic field strength daily

plots (versus GMT) are usually dissimilar (in both amplitude and relative phase). GRA

INTERSATELLITE LINK DESIGN ISSUES M.S. Thesis
Richard S. Fuhrmann 1985 112 p
(AD-A166761; AFIT/CI/NR-86-43T) Avail: NTIS HC A06/MF A01 CSCL 17/2

An intersatellite link is a communications link that directly connects two separate satellites. One satellite could have several links to numerous other satellites. In some of the literature, ISLs have also been called crosslinks. The first Intersatellite Link (ISL) was demonstrated by radio amateurs in 1975. The National Aeronautics and Space Administration (NASA) pursued testing that same year. NASA established links between satellites then in orbit. Sponsored by the U.S. Air Force and Navy, Lincoln Experimental Satellites (LES) 8 and 9 were launched in 1976 and established the technical feasibility of ISLs. This thesis explores some of the major design issues involved in ISLs. Two basic approaches are considered, millimeter wave (MMW) and optical. For the MMW approach, the design issues covered were frequency, antenna positioning, acquisition and tracking, antenna type, power amplification, and link analysis. For the optical approach, the design issues covered were laser source selection, optical detection, tracking and acquisition, and proposed systems. Trade-offs involved in system design were analyzed and possible applications of ISLs discussed. GRA

A MODIFICATION OF THE H-133 GROUND COMMUNICATIONS HEADSET FOR USE IN INTENSE NOISE ENVIRONMENTS
Charles W. Nixon and Henry C. Sommer 7 Mar. 1986 31 p
(AD-A166981; AAMRL-TR-86-009) Avail: NTIS HC A03/MF A01 CSCL 17/2

Detailed technical information and instructions are provided for a simple modification of the Air Force standard H-133 ground communications headset for use in intense noise environments at levels of 135 db (SPL) and higher. This modification involves the replacement of the conventional H-136 earphone with a miniaturized receiver mounted on a custom molded insert earplug. An adaptor box-line potentiometer is fabricated to provide manual control of the level of the speech signal at the ear of the wearer. The modified H-133 communications headset has been utilized at selected Air Force bases by ground maintenance personnel who rate the hearing protection and voice communications performance as excellent. MONOPOLE ELEMENT AT THE CENTER OF A CIRCULAR GROUNDPLANE OF ARBITRARY RADIUS. VOLUME 1: THEORY AND RESULTS Final Report
M. M. Weiner, S. P. Cruze, C. C. Li, and W. J. Wilson Mar. 1986 136 p
(Contract F19628-84-C-0001)
(AD-A166991; MTR-9622-Vol-1) Avail: NTIS HC A07/MF A01 CSCL 20/14

The Air Force SINCGARS VHF-FM radio is a frequency-hopping anti-jam device utilizing electrically short antenna to minimize aerodynamic drag on airborne platforms. The development of optimally efficient, electronically tuneable antennas for this radio is of interest. Although the antenna groundplane is platform-dependent, it is usually small compared to an rf wavelength. A circular groundplane provides a standardized geometry with which to model and evaluate candidate antennas. Accordingly, a VHF antenna range with an 8 ft. diameter circular groundplane has been constructed to evaluate candidate antennas. The electrical properties of a monopole element at the center of a circular groundplane of finite radius are of interest to this program for (1) qualifying the antenna range; (2) establishing antenna standards with which to measure test antennas; and (3) modeling candidate antennas. A survey of the literature revealed that although this antenna has the simplest geometry of any monopole antenna, its properties are neither well understood nor standardized, particularly for groundplane radii which are small or comparable to a wavelength. This paper attempts to address this deficiency. Author (GRA)

PHASE COMPARISON TIME DELAY ESTIMATION USING WIDEBAND SIGNALS M.S. Thesis
J. D. Hatlestad and D. W. Ricker Apr. 1986 77 p
(AD-A167025; TR-86-03) Avail: NTIS HC A05/MF A01 CSCL 17/2

A method of phase comparison time delay estimation using large time-bandwidth product signals is presented. This method compares the phases of the matched filters for each channel, and it is shown that for signals with symmetric power spectra, a meaningful estimate of the time delay can be expected from this phase information and knowledge of the carrier frequency of the signal. The estimator is evaluated while operating in white Gaussian noise which is in general correlated between channels, and curves are given for the density function, mean, and variance of the estimator for various noise assumptions. The estimator is shown to take advantage of the processing gain of large time-bandwidth product signals to reduce the variance of the time delay estimate. GRA

AN INVESTIGATION OF DIELECTRIC LOADED RIDGED WAVEGUIDE Final Report, Jun. 1981 - Dec. 1984
Charles W. Young, Jr. 31 Mar. 1986 145 p
(AD-A167269; NRL-8917) Avail: NTIS HC A07/MF A01 CSCL 09/1

In this report, a complete modal analysis is made for ridged waveguide partially loaded with dielectric. Cutoff frequency calculations are derived for the different waveguide modes to provide the actual single mode bandwidth. Mathematical solutions for propagation characteristics, both phase and loss, and for peak power breakdown levels are derived for the dominant mode. It is shown that true TE or TM modes do not exist in the dielectric loaded ridged waveguide, contrary to the assumption made in the only published analysis of such waveguide. Numerical examples are cited to demonstrate the large single mode bandwidths that may be achieved with dielectric loaded ridge waveguide and the considerable increase in theoretical peak power breakdown levels over that of either empty ridged waveguide or dielectric slab loaded rectangular waveguide having the same single mode bandwidth. A TWO-DIMENSIONAL STUDY OF THE INFLUENCE ON TARGET LOADING OF NUMERICAL WAVE REFLECTIONS FROM TRANSMISSIVE COMPUTATIONAL BOUNDARIES Final Report, Feb. 1984 - Jun. 1985
Richard E. Lottero and John D. Wortman Mar. 1986 48 p
(AD-A167299; BRL-MR-3503) Avail: NTIS HC A03/MF A01 CSCL 20/4

This report quantifies the changes in the loading on a target caused by the arrival of artificial, numerically-induced reflections of waves from the transmissive boundaries of a computational grid. Several computations were performed, using the two-dimensional Cartesian coordinates mode of the Ballistic Research Laboratory's version of the airblast HULL hydrodynamics computer code. HULL uses a two-step, explicit differencing method to solve the inviscid, unsteady Euler equations. A target is simulated in the computational grid by generating aggregates of rigid, immobile, and impermeable flow-field cells. The simple transmissive boundaries in HULL simulate a zero-gradient condition across the boundary for both the pressure and the normal component of velocity. Simple transmissive boundaries such as these will partially reflect waves that strike them, including shock, compression, and expansion waves. The strength of these reflected waves is directly related to the strength of the incident waves. These reflected waves then travel back into the computational grid, modifying the flow-field conditions in the regions through which they pass, thereby ending the simulation of free-field conditions. MOTION SENSITIVE FRAME INTEGRATION Patent Application
Roger A. May, inventor (to Air Force) Filed 24 Feb. 1986 15 p
(AD-D012291; US-Patent-Appl-SN-831894) Avail: NTIS HC A02/MF A01 CSCL 17/2

Noise smoothing of imaging data is performed using frame integration, by averaging pixels over time instead of space, without resulting in a smear of moving objects by: sensing image motion; and enabling frame integration on only stationary scene pixels. Image motion is sensed by: producing a differencing signal which indicates the difference between new image data and frame integrated data; and comparing the differencing signal with a threshold signal. When the threshold signal has a value which approximately equals expected image noise, then the image data processed by a particular pixel may be deemed non-moving when the difference signal is less than the threshold signal, and the image data may be deemed to depict moving objects otherwise. Finally, image data is conducted unprocessed to the display for moving scene pixels, while frame integrated image data is conducted to the display for stationary scene pixels. Author (GRA)

DOUBLE SIDEBAND GENERATION WITH SERRODYNE MODULATORS Patent Application
Minarik, inventor (to Air Force) et al Filed 3 Feb. 1986 19 p
(AD-D012293; US-Patent-Appl-SN-825107) Avail: NTIS HC A02/MF A01 CSCL 17/2

The present invention utilizes a pair of single sideband serrodyne frequency modulators to achieve double sideband generation with carrier and unwanted sideband suppression that is characteristic of the individual single sideband serrodyne modulator. The RF input signal is applied to a 90 degree 3 dB hybrid power divider to obtain two RF carrier signals that are

90 degrees out of phase. One of the RF carrier signals is applied to the first single sideband serrodyne modulators which is used to frequency shift the drive signal above the RF carrier signal. The other serrodyne modulator is used to frequency shift the drive signal below the RF carrier signal. The output signals from the individual modulators which are 90 degrees out of phase, are then combined in a second 90 degree 3 dB hybrid power divider to obtain the upper and lower sidebands at the output. In order to achieve true double sideband, suppressed-carrier operation, the modulating frequencies to each serrodyne modulator would be the same, but out of phase. GRA

A 3-D ANALYSIS OF MAXWELL'S EQUATIONS FOR CAVITIES OF ARBITRARY SHAPE
J. H. Whealton, G. L. Chen, R. W. McGaffey, R. J. Raridon, E. F. Jaeger, M. A. Bell, and D. J. Hoffman Mar. 1986 26 p
(Contract DE-AC05-84OR-21400)
(DE86-007883; ORNL/TM-9792) Avail: NTIS HC A03/MF A01

A three-dimensional analysis of cavity antennas is presented. The analysis is based on the finite difference method with a successive overrelaxation convergence scheme. This method permits the calculation of resonance frequencies and corresponding electric and magnetic fields of eigenmodes in a cavity antenna with an arbitrary shape. DOE

N86-30920# Sandia National Labs., Albuquerque, N. Mex.
METHODS FOR DEVELOPING JAM-RESISTANT SECURITY COMMUNICATIONS NETWORKS AT FIXED-SITE FACILITIES
D. J. Gangel, J. E. Heustess, and M. K. Snell 1986 6 p Presented at the Carnahan Conference on Security, Lexington, Ky., 14 May 1986
(Contract DE-AC04-76DP-00789)
(DE86-001321; SAND-85-2128C; CONF-860519-1) Avail: NTIS HC A02/MF A01

Considerable work has been done identifying and developing equipment and procedures that can be used to improve the survivability of a security communications network during a jamming assault. Insight is given into alternate communications methods that can be used to develop resistance to jamming by supplementing existing radio communications. The spatial properties of jamming are then discussed and examples of how these properties can be exploited are examined. Also discussed are spread-spectrum radios that are highly resistant to jamming and the importance of jamming exercises. DOE

RECEIVER FOR DIGITAL RADIO BROADCASTING VIA SATELLITE [EEN ONTVANGER VOOR DIGITALE RADIO-OMROEP VIA EEN SATELLIET]
C. R. deGraaf Oct. 1984 106 p In DUTCH
(ESA-86-97313) Avail: NTIS HC A06/MF A01

Quadrature Phase Shift Keying (QPSK) demodulators were investigated; a differential-coherent demodulator (with delay-line) for a 20.48 Mbit/sec and 118 MHz medium frequency was developed. A modified professional coherent demodulator (With Costas-loop carrier wave regaining) (CD), was compared with the DQPSK. At the cost of higher circuit complexity and more adjustings, the CD shows better performances; both demodulators show deviation values < 2dB. Applied bit error detection and correction methods were investigated and decoding tables were developed. In cases of high system reserves (e.g., central antenna installations of TV-receiver installations) the cheaper DQPSK is recommended. A prefabricated delay-line (and medium frequency filter) in surface acoustic wave technique is recommended to avoid complicated adjusting procedures. ESA

APPLICATION OF AN ADDITIONAL CONTROLLABLE LOAD (ACL) WITH CHOPPER CONNECTED TO THE DIRECT CURRENT LINK (DCL) OF AN AUTONOMOUS WIND ENERGY POWER SYSTEM (WEPS) [TOEPASSING VAN EEN EXTRA REGELBARE BELASTING MET CHOPPER DIE WORDT AANGESLOTEN OP DE GELIJKSTROOMTUSSENTRAP VAN EEN AUTONOME WINDENERGIECENTRALE]
A. H. A. M. Smets May 1984 125 p In DUTCH
(EMV84-05; ESA-86-97318) Avail: NTIS HC A06/MF A01

An ACL consisting of a (fast) thyristor chopper with indirect commutation and loaded by a resistor is described. The ACL provides a reduction of grid voltage distortions, reactive power of the WEPS diesel generator, and the amplitude of higher harmonic currents in the autonomous grid. Ripple currents in the DCL are limited by the connection between chopper and DCL. An additional choke is connected in series with the existing choke in the DCL. Chopper and a smoothing capacitor were connected with one pole to the junction of both chokes. A resonance circuit is formed using chokes and capacitor. The resonance frequency is chosen such that no impermissible oscillations occur in the DCL. Equations to calculate components of the DCL and chopper for their dimensioning were derived. In an experimental set-up consisting of a part of the WEPS, measurements were carried out. ESA

FOUR-PHASE MODEMS FOR A SATELLITE CHANNEL: DEMODULATION VIA DIFFERENTIAL DETECTION [VIER FASE-MODEMS VOOR EN SATELLITE-KANAAL: DEMODULATIE VIA DIFFERENTIELE DETEKTIE]
J. L. Manders May 1984 60 p In DUTCH; ENGLISH summary
(ESA-86-97390) Avail: NTIS HC A04/MF A01

Two quarternary phase shift keying modems in which demodulation takes place according to the principle of differential detection (DQPSK-modems) were developed, for investigations concerning digital transmission via communication satellites. Both modems, one with a 4 Mbit/sec bit rate and Nyquist Shaping (NS) in the transmitter, the other a 8.448 Mbit/sec bit rate and NS in the receiver, work on a 70 MHz intermediate frequency. Bit error rate was measured in back-to-back operation, via a translator loop, and via the A2 transponder of the OTS-2 satellite. The 4 Mbit/sec modem shows a 2.5 dB degradation with respect to the ideal DQPRS curve, while the 8.448 Mbit/sec modem shows a 1.8 dB deviation at a $Pe = 0.0001$ random error. ESA

SPACE-TIME PROCESSING FOR WEAK SIGNAL DETECTION IN NON-GAUSSIAN AND NONUNIFORM ELECTROMAGNETIC INTERFERENCE (EMI) FIELDS
David Middleton Feb. 1986 185 p Sponsored by DOD
(PB86-193406; NTIA-CR-86-36) Avail: NTIS HC A09/MF A01 CSCL 09D

A canonical theory of threshold, or weak-signal detection in

A canonical theory of threshold, or weak-signal detection in
non-Gaussian space-time fields is developed (Part 1) and Impledesired signals and non-Gaussian electromagnetic interference (EMI) environments. Both optimum threshold and suboptimum processing algorithms are obtained and their performance evaluated in the general weak-signal regimes. The major extension of the present study with regard to recent work involving weak-signal reception is to include the effects of nonuniform spatial noise fields on beam forming and signal detection with arbitrary arrays. Various array structures, fading models, noise statistics (Class A, B noise, etc.), as well as numerical examples are included, to illustrate the concepts, methods, and applications for telecommunication environments. WILD BEARING ANALYSIS. EAAF (EXTENDED ALGORITHM ANALYSIS FAMILY) Interim Report
Michael Rennie 10 Jul. 1985 14 p Prepared in cooperation with Mathematical Analysis Research Corp., Claremont, Calif.
(Contract NAS7-918)
(NASA-CR-176985; JPL-D-2783; NAS 1.26:176985; AD-A166509; AD-E750871; TM-3) Avail: NTIS HC A02/MF A01 CSCL 17C

This is one of a series of algorithm analysis reports performed for the US Army Intelligence Center and School covering selected algorithms in existing or planned Intelligence and Electronic Warfare (IEW) systems. This report addresses derivation of a method of accounting probabilistically for the possibility of a given bearing being wild. It is an interim report on one of several methodological investigations in progress in this area. Author (GRA)

DETERMINATION OF ANTENNAE PATTERNS AND RADAR REFLECTION CHARACTERISTICS OF AIRCRAFT
H. Bothe, D. Macdonald, and A. Pool, ed. May 1986 138 p
(AGARD-AG-300-Vol-4; ISBN92-835-1530-7) Avail: NTIS HC A07/MF A01

The different types of aircraft antennas, their radiation characteristics and their preferred siting on the airframe are described. Emphasis is placed on the various methods for determining aircraft antenna radiation patterns (ARP) and advantages, disadvantages and limitations of each method are indicated. Mathematical modelling, model measurements and in-flight measurements in conjunction with the applied flight test techniques are included. Examples of practical results are given. Methods of determining aircraft radar characteristics are also described, indicating advantages, disadvantages and limitations of each method. Relevant fundamentals of radar theory are included only as necessary to appreciation of the real meaning of radar cross section (RCS) and angular glint. The measuring methods included are dynamic full-scale, static full-scale, sub-scale optical, ultrasonic and radio modelling. References are made to RCS measuring facilities in the USA and Europe and the UK Radio Modelling Facility is used extensively to exemplify the sub scale technique. Author

THEORETICAL AND MATERIAL STUDIES ON THIN-FILM ELECTROLUMINESCENT DEVICES Biannual Report, 1 Oct. 1985 - 31 Mar. 1986
C. J. Summers and K. F. Brennan Jul. 1986 37 p
(Grant NAG1-586; Proj. A-4168)
(NASA-CR-177150; NAS 1.26:177150; BAR-2) Avail: NTIS HC A03/MF A01 CSCL 09A

A theoretical study of resonant tunneling in multilayered heterostructures is presented based on an exact solution of the Schroedinger equation under the application of a constant electric field. By use of the transfer matrix approach, the transmissivity of the structure is determined as a function of the incident electron energy. The approach presented is easily extended to many layer structures where it is more accurate than other existing transfer matrix or WKB models. The transmission resonances are compared to the bound state energies calculated for a finite square well under bias using either an asymmetric square well model or the exact solution of an infinite square well under the application of an electric field. The results show good agreement with other existing models as well as with the bound state energies. The calculations were then applied to a new superlattice structure, the variablly spaced superlattice energy filter, (VSSEP) which is designed such that under bias the spatial quantization levels fully align. Based on these calculations, a new class of resonant tunneling superlattice devices can be designed. Author

A DESIGN STUDY FOR THE USE OF A MULTIPLE APERTURE DEPLOYABLE ANTENNA FOR SOIL MOISTURE REMOTE SENSING SATELLITE APPLICATIONS Final Report
Peter Foldes Aug. 1986 208 p
(Contract NAS1-17209)
(NASA-CR-178154; NAS 1.26:178154) Avail: NTIS HC A10/MF A01 CSCL 09A

The instrumentation problems associated with the measurement of soil moisture with a meaningful spatial and temperature resolution at a global scale are addressed. For this goal only medium term available affordable technology will be considered. The study while limited in scope, will utilize a large scale antenna structure, which is being developed presently as an experimental model. The interface constraints presented by a singel Space Transportation System (STS) flight will be assumed. Methodology consists of the following steps: review of science requirements; analyze effects of these requirements; present basic system engineering considerations and trade-offs related to orbit parameters, number of spacecraft and their lifetime, observation angles, beamwidth, crossover and swath, coverage percentage, beam quality and resolution, instrument quantities, and integration time; bracket the key system characteristics and develop an electromagnetic design of the antenna-passive radiometer system. Several aperture division combinations and feed array concepts are investigated to achieve maximum feasible performance within the state STS constraints. B.G.

ONE DIMENSIONAL MODELS FOR RELATIVISTIC ELECTRON BEAM DIODE DESIGN Interim Report, 1 Jan. 1984 - 30 Apr. 1985
John M. Finn, Arne W. Fliflet, and Wallace M. Manheimer 28 Feb. 1986 28 p
(AD-A165953; NRL-MR-5727) Avail: NTIS HC A03/MF A01 CSCL 09/1

Several one dimensional models are derived which approximate the relativistic flow of high current beams in diodes. Using these models as a starting point, a diode for a 1 GW beam for a 35 GHz gyrotron oscillator is easily designed. The analysis is based on four one dimensional planar or conical models for electron flow in diodes. The planar models are relativistic and can be used to obtain electrode shapes for space charge limited flow. The conical models shed light on important geometric effects. Principally, it is shown that the space charge limited current is larger in realistic geometries than in the corresponding planar configuration. GRA

STOCHASTIC SYSTEMS WITH SMALL NOISE, ANALYSIS AND SIMULATION: A PHASE LOCKED LOOP EXAMPLE
P. Dupuis and H. Kushner Aug. 1985 49 p
(Grant AF-AFOSR-0116-81)
(AD-A166148; LCDS-85-20; AFOSR-86-0033TR) Avail: NTIS HC A03/MF A01 CSCL 09/4

Systems with wide bandwidth noise inputs are a common occurrence in stochastic control and communication theory and elsewhere; e.g., tracking or synchronization systems such as phase locked loops (PLL). One is often interested in calculating such quantities as the probability of escape from a desired error set, in some time interval, or the mean time for such escape. Diffusion approximations (the system obtained in the limit bandwidth approaches infinity) are often used for this, being easier to analyze. We study a particular form of the PLL owing to the great practical importance of the system and because it provides a useful vehicle for understanding the extent of validity of the asymptotic methods for such systems. The basic analytical techniques are from the theory of large deviations. One seeks information on the escape probabilities, mean times, and on the most likely exit paths and exit locations. Also, we seek information on the interactions between the signals to be tracked and the noise which are most likely to lead to exit. The large deviations technique is eminently suited to this job. Simulations are taken in order to understand the range of validity of the asymptotic method. Agreement between the predictions and sample estimates is good over noise intensity levels which seem to be ever larger than those typically occurring in practice. GRA

FUNDAMENTAL QUANTUM 1/f NOISE IN ULTRASMALL SEMICONDUCTOR DEVICES AND THEIR OPTIMAL DESIGN PRINCIPLES Progress Report, 1 May - 30 Nov. 1985
Peter H. Handel 1 Dec. 1985 35 p
(Grant AF-AFOSR-0130-85)
(AD-A166154; AFOSR-85-0130TR; PR-1) Avail: NTIS HC A03/MF A01 CSCL 09/3

As a first step of a more general study of 1/f noise in semiconductor devices n(+)(-)p diodes have been investigated with emphasis on HgCdTe photodetectors. Quantum 1/f noise has been calculated in the surface and bulk recombination currents, in the diffusion and field currents, and in the tunneling currents. Due to the large localized electric field at the surface, a larger fractional quantum 1/f noise power is obtained for surface recombination currents than for similar bulk recombination currents. All quantum 1/f noise calculations are first principles calculations with no free parameters, based on the quantum 1/f effect in scattering and recombination cross sections, as well as in tunneling rates. Together, the quantum 1/f mobility fluctuations, bulk and surface recombination speed fluctuations and tunneling rate fluctuations can account for the observed 1/f noise and can be used for optimizing small devices, as indicated by experiments at SBRC, Univ. of Minnesota and Florida. Some suggestions are given at the end of Sec. II. For devices larger than 10 microns coherent state quantum 1/f noise becomes important, according to a new interpolation formula. The new interpolation formula which bridges the gap between conventional (incoherent) quantum 1/f noise and coherent state quantum 1/f noise is in general agreement with measurements in p-n diodes and transistors, and will be tested in more detail in the near future. The theory has also been successfully applied to SQUIDs. GRA

N86-30939# Air Force Inst. of Tech., Wright-Patterson AFB, Ohio.
STUDY OF ELECTRICAL RESISTIVITY ON THE LOCATION AND IDENTIFICATION OF CONTAMINATION Ph.D. Thesis
Brian D. McCarty 1985 273 p
(AD-A166405; AD-E950826; AFIT/CI/NR-86-14T) Avail: NTIS HC A12/MF A01 CSCL 09/3

Electrical resistance studies were conducted in two laboratory models to determine electrical resistivity relationships and to use those defined relationships to identify contamination spikes. A good correlation was established between resistance data and the composition of leachate and copper spiked leachate gelatin blocks under study. The major variable that could not be eliminated from this study which had the greatest effect on data was moisture content. This thesis contains a review of the theory and field application of electrical resistivity, a description of the experimental approach used, and a summary of the data collected. GRA

SYNTHESIS OF A SELF-TIMED CONTROLLER FOR A SUCCESSIVE-APPROXIMATION A/D CONVERTER
Tam-Anh Chu and Lance A. Glasser Oct. 1985 15 p
(Contract N00014-80-C-0622; Grant NSF MCS-79-15255)
(AD-A166788; VSLI-MEMO-85-274) Avail: NTIS HC A02/MF A01 CSCL 09/5

This paper documents the procedure for designing a self-timed controller for a successive-approximation A/D converter. From the functional specification, a Signal Transition Graph is constructed to describe the operation of the control circuit. This graph is then modified into a well-formed graph. Such a graph can be transformed into a deadlock-free and hazard-free implementation directly. The structure of the control circuit and the logic equations are then derived directly from the graph. Author (GRA)

A HIGH-SPEED ASYNCHRONOUS COMMUNICATION TECH-

NIQUE FOR MOS (METAL-OXIDE-SEMICONDUCTOR) VLSI SYSTEMS M.S. Thesis
Paul D. Bassett Dec. 1985 104 p
(Contract N00014-80-C-0622)
(AD-A166846; AD-E950814; VLSI-MEMO-85-283) Avail: NTIS HC A06/MF A01 CSCL 20/12

As MOS technologies advance, the relative differences between on-chip and off-chip delays increase. Drivers and receivers can be designed which allow high bit rate communications (greater than 100 Mbits/sec) between MOS chips at the expense of increased latency. Designing synchronous systems which couple a high clock frequency with large and variable delays is difficult and expensive due to the complexity of insuring that no delays violate the constraints imposed by synchronous operation. A circuit-based technique for automatically adjusting signal delays in an MOS system has been developed. The Dynamic Delay Adjustment (DDA) technique provides reliable high speed communications directly between MOS chips independent of the delay between the chips. The amount of phase jitter immunity provided by the synchronizer can be traded off against circuit complexity; the signal delays are adjusted continuously to track temperature induced delay variations. A 3 micron DDA synchronizer has been fabricated to confirm the validity of the DDA approach; test results will be presented. Author (GRA)

A COHERENT VLSI DESIGN ENVIRONMENT Semiannual Report, 1 Oct. - 31 Mar. 1986
Paul Penfield, Jr. 31 Mar. 1986 62 p
(Contract N00014-80-C-0622)
(AD-A166848; AD-E950814) Avail: NTIS HC A04/MF A01 CSCL 09/5

This report covers the period from October 1, 1985 through March 31, 1986. The research discussed here is described in more detail in several published and unpublished reports cited below. The CAD frame Schema has received limited but instructive applications. Connections to remote simulation servers are transparent to the user. More substantial uses are anticipated during the next half year. Waveform bounding results have been extended to ECL technology, and a variety of the results are being applied to an analog application in early vision. Many of the previous results have been transferred to industry and are being used in commercial simulators. Fundamental speed limits of collections of active devices with parasitics have been found. These are independent of how the devices are interconnected. A reliability simulator has been written, and models are being developed for it, to describe three important effects, namely mental migration, hot-electron trapping, and time-dependent dielectric breakdown. Work continues on the fat-tree architecture, and on the efficient realization of various classes of circuits. New results in graph bisection and routing were made during this period. It is now known how to imbed some classes of communications networks in others, for example binary trees in hypercubes. Author (GRA)

N86-30945# Avco-Everett Research Lab., Mass.
DIFFUSE DISCHARGE SWITCH ANALYSIS Final Report, 1 Jul. 1982 - 30 Sep. 1985
P. Rostler Feb. 1986 65 p
(Contract F33615-82-C-2249)
(AD-A167282) Avail: NTIS HC A04/MF A01 CSCL 09/1

The growth of streamers which leads to arcing is studied for the high current discharge needed to make an opening switch. The scaling of discharge parameters is analyzed for the switch application and previous experimental work on streamer growth is reviewed. A general theory of streamer growth is developed from fundamental gas and electrodynamic equations and an equation is derived which predicts the streamer growth rate and which can be evaluated numerically. The implications for e-beam controlled switches are discussed. GRA

MEASUREMENT OF INTERNAL CAPACITANCES OF INTEGRATED CIRCUITS
K. White, D. Palmer, C. F. Hawkins, and G. L. Martin 1986 9 p Presented at the Electronic Components Conference, Seattle, Wash., 5 May 1986 Prepared in cooperation with New Mexico Univ., Albuquerque
(Contract DE-AC04-76DP-00789)
(DE86-006494; SAND-85-2420C; CONF-860566-1) Avail: NTIS HC A02/MF A01

Direct probe measurements have been made of intra-transistor and interconnection capacitances in integrated circuit CMOS technologies down to 2 microns detail. Resolution of measurements have been confirmed to 1 femtofarad. These differential capacitance measurements are taken at 1 MHz, comparable to the normal frequency range of circuit operation. These measurements are performed directly on structures normally occurring on integrated circuit wafers, not on special enhanced capacitive test keys or using custon on-chip amplifiers. The method used the HP-4062B semiconductor parameter extractor. Elaborate shielding and ac-guarding of adjacent microfeatures were necessary to measure only the capacitances of interest. Extensive signal averaging and system capacitance canceling was performed. Although elaborate and detailed, the method developed can be used by any semiconductor production facility on their standard test structures. The voltage dependence of the junction capacitances of the drain to p-well and the gate to p-well were found consistent with calculation down to 2 micron dimensions. The gate to drain overlap capacitance was also examined allowing an estimate of the fringing contribution. DOE

TESTING, DESIGN AND MODELING ISSUES IN RADIATION-HARDENED CMOS INTEGRATED CIRCUITS
James E. Gover and Mark R. Ackermann 1986 8 p Presented at the 3d International Workshop on Future Electron Devices, Tokyo, Japan, 11 Mar. 1986
(Contract DE-AC04-76DP-00789)
(DE86-007707; SAND-86-0334C; CONF-860385-1) Avail: NTIS HC A02/MF A01

Continued research and greater understanding of ionization damage mechanisms in silicon/silicon dioxide structures will lead to improved total dose modeling techniques and a better definition of proper total dose testing conditions. Combining computer models with laboratory test data will allow engineers to predict the total dose response of components for irradiation periods ranging from

years to less than a second. Recent progress in the understanding of dose-rate phenomena in integrated circuits has identified Rail Span Collapse as a possible upset mechanism. Use of this model aids the design of ICs expected to have an upset level above 1E10 rad(Si)/sec. Further research into photo current generation, rail span collapse, and local upset mechanisms will allow maximization of IC upset levels. DOE

RELATIVISTIC KLYSTRON
R. Marks Sep. 1985 23 p
(Contract DE-AC03-76SF-00098)
(DE86-009217; LBL-20918) Avail: NTIS HC A02/MF A01

Theoretical analysis is presented of a relativisic klystron; i.e., a high-relativistic bunched electron beam which is sent through a succession of tuned cavities and has its energy replenished by periodic induction accelerator units. Parameters are given for a full-size device and for an experimental device using the FEL at the ETA; namely the ELF Facility. DOE

N86-30952# Sandia National Labs., Albuquerque, N. Mex.
NUMERICAL AND EXPERIMENTAL STUDY OF RESIDUAL STRESSES AND THERMAL FATIGUE IN SOLDERED ELECTRONIC ASSEMBLIES
R. J. Bourcier and J. J. Stephens 1986 28 p Presented at the Symposium on Computer Modeling of Fabrication Processes and Constitutive Behavior of Metals, Ottawa, Ontario, 15 May 1986
(Contract DE-AC04-76DP-00789)
(DE86-008779; SAND-86-0803C; CONF-860590-1) Avail: NTIS HC A03/MF A01

The assembly examined consists of thin plates of alumina, Kovar, 410 stainless steel and 6061 aluminum bonded together using layers of three different solder alloys: 63% Sn - 37% Pb, 50% Pb - 50% In and 40% In - 40% Sn - 20% Pb. Numerical simulation of the fabrication process was performed using a simplified axisymmetric finite element microcell model of the actual assembly. The alumina, Kovar, 410 stainless steel and 6061 aluminum layers were modeled as temperature-dependent elastic-plastic materials while the solder alloys were treated as creeping solids following solidification. Experimental testing of the solder alloys was used to generate input for the finite element code constitutive models. The numerical results of this study have provided guidelines for the successful fabrication of the subject assembly. In particular, slower cooling rates following solidification of the solders have been shown to dramatically lower bending stresses generated in the alumina plate. The experimental portion of the program has provided data on the degration of solder bond integrity used to thermal cycling and has identified possible important factors in the mechanical response of thin solder layers. CIRCULAR WAVEGUIDE MODE CONVERTERS AT 140 GHz
J. Trulsen, P. Woskoboinikow, and R. J. Temkin Jan. 1986 62 p
(Contract DE-AC02-78ET-51013)
(DE86-009075; DOE/ET-51013/173; PFC/RR-86-2) Avail: NTIS HC A04/MF A01

A unified derivation of the coupled mode equations for circular waveguide is presented. Also, approximate design criteria for TE/sub 0n/ to TE/sub 0n'/ axisymmetric, TE01 to TE11 wriggle, and TE01 to TM11 bend converters are reviewed. Numerically solving the coupled mode equations, an optimized set of mode converters has been designed for conversion of a 2 millimeter wave TE03 mode into TE11. This set consists of axisymmetric TE03 to TE02 and TE02 to TE01 converters followed by a wriggle TE01 to TE11 converter. This mode converter set was fabricated and tested using a 3 kW, 137 GHz gyrotron. A TE11 mode purity of better than 97% was achieved. The TE01 to TE11 wriggle converter was experimentally optimized for a measured conversion efficiency of better than 99% not including ohmic losses. DOE

IN SITU EXAMINATION OF SEGREGATION AND WEAR PROCESSES OF PRECIOUS METAL ELECTRICAL CONTACT ALLOYS
L. E. Pope and D. E. Peebles 1986 28 p Presented at the 32nd Holm Conference, Boston, Mass., 27 Oct. 1986
(Contract DE-AC04-76DP-00789)
(DE86-009089; SAND-85-2570C; CONF-861051-2) Avail: NTIS HC A03/MF A01

The electrical contact resistance and friction coefficient of gold based (ASTM B541) and palladium based (ASTM B540) precious metal electrical contact materials have been measured simultaneously with an in situ pin-on-plate device in a scanning Auger analytical system. Intermittent surface analysis of the wear track was performed. The friction coefficient varied from 2.2 to 2.6 for high vacuum ambients containing oxygen (10(-6) torr) or nitrogen (10(-7) torr), but was 1.6 for an atmospheric ambient (700 torr) containing both oxygen (5%) and nitrogen (95%). In comparison, the friction coefficient was less than 0.5 in laboratory air. The electrical contact resistance was less than 15 milliohms for all test conditions but varied inversely with the friction coefficient. Segregation of sulfur to the wear track was observed in situ in the 700 torr ambient after as few as ten wear cycles. The friction coefficients for these tests were larger than for previous experiments; the increase was attributed to surface depletion of copper. DOE

ESTIMATED BURST POWER REQUIREMENTS FOR SELECTED SDI MISSIONS
W. H. McCulloch 1986 22 p Presented at the 3rd Symposium on Space Nuclear Power Systems, Albuquerque, N. Mex., 13 Jan. 1986
(Contract DE-AC04-76DP-00789)
(DE86-005438; SAND-85-1840C; CONF-860102-6) Avail: NTIS HC A02/MF A01

Power requirements are estimated for several candidate missions proposed for the Strategic Defense Initiative. The missions of interest are those requiring large electric power supply and power conditioning systems for space-based directed energy weapons, including electromagnetic launchers, free-electron lasers, and neutral particle beams. In general, the power requirements are determined by working backward from lethality considerations, using preliminary descriptions of weapons performance and of candidate engagement scenarios. DOE

SIMPLE, COMPACT, HIGH BRIGHTNESS SOURCE FOR X-RAY LITHOGRAPHY AND X-RAY RADIOGRAPHY
A. M. Hawryluk 19 Feb. 1986 10 p Presented at the Society of Photo-Optical Instrumentation Engineers Conference on Electron-beam, X-ray and Ion-beam Techniques for Submicrometer Lithographies, Santa Clara, Calif., 9 Mar. 1986
(Contract W-7405-eng-48)
(DE86-009723; UCRL-93474; CONF-8603111-1) Avail: NTIS HC A02/MF A01

A simple, compact, high brightness x-ray source has recently

been built. This source utilizes a commercially available, cylindrical geometry electron beam evaporator, which has been modified to enhance the thermal cooling to the anode. Cooling is accomplished by using standard, low-conductivity laboratory water, with an inlet pressure of less than 50 psi, and a flow rate of approx.0.3 gal/min. The anode is an inverted cone geometry for efficient cooling. The x-ray source has a measured sub-millimeter spot size (FWHM). The anode has been operated at 1 KW e-beam power (10 KV, 100 ma). Higher operating levels will be investigated. A variety of different x-ray lines can be obtained by the simple interchange of anodes of different materials. Typical anodes are made from easily machined metals, or materials which are vacuum deposited onto a copper anode. Typically, a few microns of material is sufficient to stop 10 KV electrons without significantly decreasing the thermal conductivity through the anode. The small size and high brightness of this source make it useful for step and repeat exposures over several square centimeter areas, especially in a research laboratory environment. For an aluminum anode, the estimated Al-K x-ray flux at 10 cms from the source is 70 microW/cm. DOE

SIMULATION AND MODELING OF HOMOGENEOUS, COMPRESSED TURBULENCE
C.-T. Wu, J. H. Ferziger, and D. R. Chapman May 1985 206 p
(Contract NCC2-15)
(NASA-CR-176939; NAS 1.26:176939; SU-TF-21) Avail: NTIS HC A10/MF A01 CSCL 20D

Low Reynolds number homogeneous turbulence undergoing low Mach number isotropic and one-dimensional compression was simulated by numerically solving the Navier-Stokes equations. The numerical simulations were performed on a CYBER 205 computer using a 64 x 64 x 64 mesh. A spectral method was used for spatial differencing and the second-order Runge-Kutta method for time advancement. A variety of statistical information was extracted from the computed flow fields. These include three-dimensional energy and dissipation spectra, two-point velocity correlations, one-dimensional energy spectra, turbulent kinetic energy and its dissipation rate, integral length scales, Taylor microscales, and Kolmogorov length scale. Results from the simulated flow fields were used to test one-point closure, two-equation models. A new one-point-closure, three-equation turbulence model which accounts for the effect of compression is proposed. The new model accurately calculates four types of flows (isotropic decay, isotropic compression, one-dimensional compression, and axisymmetric expansion flows) for a wide range of strain rates. ADAPTIVE COMPUTATIONAL METHODS FOR SSME INTERNAL FLOW ANALYSIS Final Report
J. Tinsley Oden 1986 58 p
(Contract NAS8-36647)
(NASA-CR-178864; NAS 1.26:178864; TR86-05) Avail: NTIS HC A04/MF A01 CSCL 20D

Adaptive finite element methods for the analysis of classes of problems in compressible and incompressible flow of interest in SSME (space shuttle main engine) analysis and design are described. The general objective of the adaptive methods is to improve and to quantify the quality of numerical solutions to the governing partial differential equations of fluid dynamics in two-dimensional cases. There are several different families of adaptive schemes that can be used to improve the quality of solutions in complex flow simulations. Among these are: (1) r-methods (node-redistribution or moving mesh methods) in which a fixed number of nodal points is allowed to migrate to points in the mesh where high error is detected; (2) h-methods, in which the mesh size h is automatically refined to reduce local error; and (3) p-methods, in which the local degree p of the finite element approximation is increased to reduce local error. Two of the three basic techniques have been studied in this project: an r-method for steady Euler equations in two dimensions and a p-method for transient, laminar, viscous incompressible flow. Numerical results are presented. A brief introduction to residual methods of a-posterior error estimation is also given and some pertinent conclusions of the study are listed. M.G.

MEASUREMENTS IN LIQUID FUEL SPRAYS Final Report, 15 Dec. 1983 - 14 Dec. 1985
Norman Chigier and Chien-Pei Mao 1985 51 p
(Contract NCC3-37)
(NASA-CR-177088; NAS 1.26:177088) Avail: NTIS HC A04/MF A01 CSCL 20D

A ground test facility is being established at NASA Lewis Research Center to simulate the environmental and flight conditions needed to study adverse weather effects. One of the most important components is the water spray system which consists of many nozzles fitted on spray bars. Water is injected through air-assisted atomizers to generate uniform size drops to simulate icing in clouds. The primary objective is to provide experimental data on drop size distribution over a wide range of operating conditions. Correlation equations for mean drop size and initial injection parameters are being determined to assist in the design and modification of the Altitude Wind Tunnel. Special emphasis is being placed on the study of the aerodynamic structure of the air-assisted atomizer sprays. Detailed measurements of the variation of drop size distribution and velocity as a function of time and space are being made. Accurate initial and boundary conditions are being provided for computer model evaluation. B.G.

VISCOUS FLOW COMPUTATIONS FOR ELLIPTICAL TWO-DUCT VERSION OF THE SSME HOT GAS MANIFOLD Interim Report
R. P. Roger 7 Mar. 1986 68 p
(Contract NAS8-36090)
(NASA-CR-178868; NAS 1.26:178868; LMSC-HEC-TR-D065161) Avail: NTIS HC A04/MF A01 CSCL 20D

The objective of the effort was to numerically simulate viscous subsonic flow in a proposed elliptical two-duct version of the fuel side Hot Gas Manifold (HGM) for the Space Shuttle Main Engine (SSME). The numerical results were to complement both water flow and air flow experiments in the two-duct geometry performed at NASA-MSFC and Rocketdyne. The three-dimensional character

of the HGM consists of two essentially different geometries. The first part of the construction is a concentric shell duct structure which channels the gases from a turbine exit into the second part comprised of two cylindrically shaped transfer ducts. The initial concentric shell portion can be further subdivided into a turnaround section and a bowl section. The turnaround duct (TAD) changes the direction of the mean flow by 180 degress from a smaller radius to a larger radius duct which discharges into the bowl. The cylindrical transfer ducts are attached to the bowl on one side thus providing a plane of symmetry midway between the two. Centerline flow distance from the TAD inlet to the transfer duct exit is approximately two feet. Details of the approach used to numerically simulate laminar or turbulent flow in the HGM geometry are presented. Computational results are presented and discussed. Author

PROBLEMS OF LARGE GAS FLOW MEASUREMENTS AT HIGH AND LOW PRESSURES [PROBLEME DER MESSUNG GROSSER GASSTROEME IM HOCH- UND NIEDERDRUCKBEREICH]
Ludwig Narjes, ed. Jul. 1985 458 p In GERMAN; ENGLISH summary Presented at Physik.-Tech. Bundesanstalt 45th Symp., Brunswick, 24-25 Jan. 1984
(PTB-Me-58; ISSN-0341-6720; ESA-86-96927) HC A20/MF A01

Precision measurement facilities of large gas flowrates and evaluation criteria are reviewed. Metrological principles, industrial measurement techniques, and normal measuring instruments were discussed. Laser Doppler anemometry applications to fluctuant gas flows; application of turbine wheel gas counters; vortex flowmeters; gas measuring bells; and the charging procedure for determination of stationary mass flowrates of gases are presented. For individual titles, see N86-30963 through N86-30982.

METROLOGICAL EVALUATION CRITERIA FOR PRECISION MEASUREMENT OF LARGE GAS FLOWS [METROLOGISCHE BEWERTUNGSKRITERIEN ZUR PRAEZISIONSMESSUNG GROSSER GASSTROEME]
L. Narjes *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 7-15 In GERMAN (For primary document see N86-30962 22-34)
Avail: NTIS HC A20/MF A01

Metrological evaluation criteria, based on principles of flow physics, for a metrological connection system are presented, as well as calibrating curve and time-stability; classified measurement inaccuracy; number of connection phases for calibrating curve production; and connection procedure. Experience in using rotary reverse gas meters, turbine disk gas meters, and critical Venturi nozzles in precision measurement of large gas flows is reviewed. Calibrating curves are plotted to determine errors. Three high pressure gas meter test benches are compared. Test points are within the statistical inaccuracy. ESA

TWO COMPONENT VELOCITY MEASUREMENTS IN FLUCTUATING GAS FLOWS USING A LASER DOPPLER ANEMOMETER (LDA) [2-KOMPONENTEN-GESCHWINDIGKEITSMESSUNGEN IN FLUKTUIERENDEN GAS-STROEMUNGEN MIT HILFE EINES LASER-DOPPLER-ANEMOMETERS (LDA)]
K. A. Buetefisch, V. Strunck, F.-R. Grosche, J. Kompenhans, H.-R. Hoefer, and K.-H. Sauerland *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 43-51 In GERMAN (For primary document see N86-30962 22-34)
Avail NTIS HC A20/MF A01

A two component Laser Doppler Anemometer (LDA) to determine velocity distribution in large wind tunnels was developed and tested. The anemometer operates in backscattering mode with up to 2.30 m operating interval allowing positioning with a transverse fixture. Measurement is performed automatically in a 1 m x 1 m x 0.5 m field point area through a computer system. Three velocity components can be measured. High scattering of LDA data due to wall distance distortion through model variations is noted. Measurements in turbulent pipe flows were performed to assess accuracy. Results compared to pressure sensor readings show good agreement. The device can be applied to determine volume flows accurately and to give complete velocity profiles. ESA

N86-30966# Physikalisch-Technische Bundesanstalt, Brunswick (West Germany).
VELOCITY PRECISION MEASUREMENTS USING LASER DOPPLER ANEMOMETRY [PRAEZISIONSMESSUNGEN VON GESCHWINDIGKEITEN MITTELS LASER-DOPPLER-ANEMOMETRIE] c35
D. Dopheide, G. Taux, and L. Narjes *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 52-81 In GERMAN (For primary document see N86-30962 22-34)
Avail NTIS HC A20/MF A01

A Laser Doppler Anemometer (LDA) was calibrated to determine its applicability to high pressure measurements (up to 10 bars) for industrial purposes. The measurement procedure with LDA and the experimental computerized layouts are presented. The calibration procedure is based on absolute accuracy of Doppler frequency and calibration of interference strip intervals. A four-quadrant detector allows comparison of the interference strip distance measurements and computer profiles. Further development of LDA is recommended to increase accuracy (0.1% inaccuracy) and to apply the method industrially. ESA

N86-30967# Physikalisch-Technische Bundesanstalt, Brunswick (West Germany).
EUROPEAN ECONOMIC COMMUNITY (EEC) TEST STAND COMPARISON [VERGLEICH DER EG-PRUEFSTAENDE] c09
B. Harbrink *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 82-116 In GERMAN Original document contains color illustrations (For primary document see N86-30962 22-34)
Avail NTIS HC A20/MF A01

The accuracy of different EEC test stands is compared using gravimetry and volumetry for primary test stands, and dispersion methods for secondary test stands. The comparison shows a systematic relative inaccuracy of 0.3%. Laser Doppler Anemometry (LDA) could be used to measure volume stream with accuracy. An LDA high pressure test stand would allow direct calibration within a measurement range of 0 to 3000 cubic meter/hr with flow rate determined with 0.1% inaccuracy. ESA

N86-30968# Physikalisch-Technische Bundesanstalt, Brunswick (West Germany).
ACCURACY OF HIGH PRESSURE GAS METER CALIBRATION IN THE NETHERLANDS [GENAUIGKEIT DER HOCHDRUCKGASZAEHLEREICHUNG IN DEN NIEDERLANDEN] c35
P. M. A. vanderKam *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 117-144 In GERMAN (For primary document see N86-30962 22-34)

Avail NTIS HC A20/MF A01

High pressure test facilities for industrial gas meters in the Netherlands are described. The calibration procedures and systems are presented. Gas compressibility effects on calibration and test facility accuracy are studied. Quality follow-up of the test facilities is described. ESA

N86-30969# Physikalisch-Technische Bundesanstalt, Brunswick (West Germany).

MEASUREMENT AND CALCULATION OF THE DENSITY OF NATURAL GASES [MESSUNG UND BERECHNUNG DER DICHTE VON ERDGASEN]

M. Jaeschke *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 144-186 In GERMAN (For primary document see N86-30962 22-34)

Avail: NTIS HC A20/MF A01

The density of natural gases is calculated from a state equation based on the AGA NX-19 calculation procedure, with 0.3% accuracy. The density is measured by weighing in laboratory with interferometric layout on a refraction index with an accuracy of 0.03% and with densitometers based on the oscillation procedure with variable accuracy according to the gases studied. The effects of the sonic velocity on the density measurement and their correction are described. With Solartron density cells, the sound dependency is compensated for by a thermal action on the spring constant of the oscillating system. Results with the densitometers show good agreement with the densities measured in the laboratory. ESA

N86-30970# Physikalisch-Technische Bundesanstalt, Brunswick (West Germany).

PRESSURE AND TEMPERATURE MEASUREMENTS ON NATURAL GASES ALONG ISOCHORES IN THE TECHNICALLY IMPORTANT STATE RANGING FROM 270 TO 300 K AND AT PRESSURES UP TO 60 BARS [P,T-MESSUNGEN AN ERDGASEN ENTLANG ISOCHOREN IM TECHNISCH WICHTIGEN ZUSTANDSBEREICH VON 270 K BIS 300 K UND BEI DRUECKEN BIS 60 BAR]

R. Weiss *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 187-204 In GERMAN (For primary document see N86-30962 22-34)

Avail: NTIS HC A20/MF A01

An isochoric test facility consisting of two pressure vessels, a thermostat, and fixtures for pressure and temperature measurement was used to calculate the gas density from pressure and temperature analytical data and measured values. The facility is analyzed for accuracy and to determine the virial factors for methane measured in a one-phase area. The composition of Ekofiskfeld natural gas samples is studied in a two-phase area based on measurement of the refraction index and of the expansion behavior. A simple state equation is used to compare measured values with the theoretical state parameters. Results show a relative inaccuracy of 2 per mill. The virial equation is applied to 4 other natural gases and shows good results for a temperature from 0 to 20 C and for a density up to 70 kg/C meter. ESA

N86-30971# Physikalisch-Technische Bundesanstalt, Brunswick (West Germany).

FIRST MEASUREMENTS WITH A LASER DOPPLER ANEMOMETER IN A HIGH PRESSURE NATURAL GAS PIPE [ERSTE MESSUNGEN MIT EINEM LASER-DOPPLER-ANEMOMETER IN EINER HOCHDRUCK-ERDGASLEITUNG]

D. Dopheide, G. Taux, and L. Narjes *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 205-228 In GERMAN (For primary document see N86-30962 22-34)

Avail: NTIS HC A20/MF A01

The applicability of Laser Doppler Anemometry (LDA) to velocity measurement in a natural gas pipe and the inaccuracy of the Doppler frequencies are studied. Test measurements show that the measuring procedure and the calibration methods can be applied at high pressure. The frequency inaccuracy is measured using a remote control programmable interference generator to obtain the signal-to-interference ratio required. The LDA emitting and receiving optics is studied, based on light particle forward scattering and backscattering for signal-to-interference ratio measurement. Bad signal quality due to high fluid velocity can be compensated for with higher laser performance. The frequency of the laser Doppler signals can be measured with an accuracy of 0.0001. ESA

N86-30972# Physikalisch-Technische Bundesanstalt, Brunswick (West Germany).

ORIFICE PLATE AND DIFFERENTIAL PRESSURE MEASUREMENT [BLENDEN- UND WIRKDRUCKMESSUNG]

W. Kerkmann *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 229-258 In GERMAN (For primary document see N86-30962 22-34)

Avail: NTIS HC A20/MF A01

The dynamics of the static pressure in the inlet distance of the plus and minus sides of a standard orifice plate with direct connection to a piezoelectric pressure indicator and along differential pressure pipes were studied. The static pressure is due to vortices and cavitation in the pipe. The dynamics of the outlet signal of the differential pressure transmitter was measured. The high pressure behavior of volume and turbine gas meters and of rotary lobe meters is discussed. ESA

N86-30973# Physikalisch-Technische Bundesanstalt, Brunswick (West Germany).

MODERN DIFFERENTIAL PRESSURE GAS COUNTER (WIGZ) MEASUREMENT [MODERNE WIRKDRUCK-GASZAEHLERMESSUNG] **c35**

O. Brandt *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 259-300 In GERMAN (For primary document see N86-30962 22-34)

Avail: NTIS HC A20/MF A01

The differential pressure gas counter facility developed to measure gas flow rate on orifice plates in the pipe system transporting Soviet gas to West Germany and France was equipped with small computers which record all the parameters of a measuring system and calculate the standard volume and the quantity of heat. These parameters are used to calibrate the facility. The differential pressure indicators and operating densitometers, the standard densitometers, pressure and temperature sensors, and calorific value indicators are described. The operation of and processing by the 16-bit microprocessor computers of all parameters are summarized. The central computer and the performance recording facility are presented. ESA

N86-30974# Physikalisch-Technische Bundesanstalt, Brunswick (West Germany).

PRACTICAL EXPERIENCES WITH HIGH PRESSURE (HP) GAS COUNTERS. PROBLEMS OF OPERATING CALIBRATION WITH HP [PRAKTISCHE ERFAHRUNGEN MIT HOCHDRUCK-GASZAEHLERN. PROBLEME DER BETRIEBSEICHUNG MIT HOCHDRUCK] **c35**

Buresch *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 301-314 In GERMAN (For primary document see N86-30962 22-34)

Avail: NTIS HC A20/MF A01

The experience gained in the use of lobed impeller meters in natural gas supply is reviewed. The problems arising from the application of turbine gas counters in high pres e measurement resulting from an unbalanced force ratio between the driving impulse of the flowing gas volume on the wheel and the frictional and inertial forces are presented. The financial and technical problems of calibration of counters for application at HP are reported. The European HP calibration test benches and the availability of accurate HP norms are discussed. ESA

N86-30975# Physikalisch-Technische Bundesanstalt, Brunswick (West Germany).

BEHAVIOR OF TURBINE WHEEL GAS COUNTERS AT HIGH PRESSURES [VERHALTEN VON TUR-

BINENRADGASZAEHLERN IM HOCHDRUCKBEREICH] c35
Dieter Schmitter *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 315-355 In GERMAN (For primary document see N86-30962 22-34)
Avail. NTIS HC A20/MF A01

The rpm rate of a turbine wheel gas meter rotor was used to determine the flow velocity of the gas. The behavior of the turbine wheel gas counters depends on the rpm measurement errors, on the total pressure loss in the counter and on the flow axial force in high pressure pipes. The forces and moments on the measuring wheel, the flow resistance, and the optimal layout of a flow channel are described. The HP deviations depend on the Reynolds number and the resonance sensitivity. A neutral behavior of the turbine can be achieved by optimizing the manufacture and installation. ESA

PRIMARY MEASUREMENT [PRIMAERE MESSUNG]
Fischer *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 356-368 In GERMAN (For primary document see N86-30962 22-34)
Avail: NTIS HC A20/MF A01

The economical aspects of accurate gas measurement with orifice plates and turbine gas counters are reviewed. The economical application of test benches and facilities for analysis and calibration of the counters is discussed. Vortex and supersonic counters are investigated for long-time stability and repeatability as well as the effects of the installation methods. Cost-to-accuracy analysis of the measuring instruments and the flow computers for automatic temperature and pressure correction and for calculation of the gas compressibility is reported. The introduction of computer monitoring of the entire pipe system and of an information system is presented. ESA

N86-30977# Physikalisch-Technische Bundesanstalt, Brunswick (West Germany).
MEASUREMENT OF SMALL PRESSURE DIFFERENCES AT A HIGH STATIC PRESSURE [MESSUNG KLEINER DRUCKDIFFERENZEN BEI HOHEM STATISCHEN DRUCK]
G. Klingenberg *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 369-390 In GERMAN (For primary document see N86-30962 22-34)
Avail: NTIS HC A20/MF A01

Test procedures using differential pressure transducers are presented. The effects of static pressure on measurement accuracy are studied. The effects of heating, time, resistance, and interference voltages on the transducers are presented and the ripple of the outlet parameter is determined. The results show voltage displacement, temperature hysteresis, and a calibration error greater than 0.3%. Float-type pressure gages, double piston gages, and fluid gages are tested. All measures show that no pressure difference greater than 12 Pa appears with the static pressure increasing to 8 MPa. ESA

N86-30978# Physikalisch-Technische Bundesanstalt, Brunswick (West Germany).
INFLUENCE OF THE FORM OF THE VORTEX BODIES ON THE TECHNICAL PERFORMANCE OF A VORTEX METER [EINFLUSS DER WIRBELKOERPERFORM AUF DAS MESSTECHNISCHE VERHALTEN DER WIRBELDURCHFLUSSMESSER]
H.-G. Kalkhof *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 391-407 In GERMAN (For primary document see N86-30962 22-34)
Avail: NTIS HC A20/MF A01

The performance of the vortex meter is reviewed. The measuring properties of the vortex meter depend on the behavior of the Strouhal, Reynolds, and Mach numbers. The vortex cavitation frequency is measured with an isothermal hot-film anemometer. Vortex bodies with T and delta profiles are studied by measuring the signal frequency period. The body thickness and length and the Reynolds number influence the Strouhal number and the relative standard difference of the period. Results are compared with measurements with a differential pressure flowmeter. The pressure loss of the vortex meter is smaller than that of the orifice plate, equal to that of the nozzle, and greater than that of the venturi nozzle. ESA

EFFECTS OF PREVIOUS DISTURBANCES ON THE METER FACTORS OF A VORTEX METER [EINFLUESS VON VORSTOERUNGEN AUF ZAEHLERFAKTOREN VON WIRBELZAEHERN] c35
J. Boehm *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 408-428 In GERMAN (For primary document see N86-30962 22-34)
Avail: NTIS HC A20/MF A01

Pulsations (100 to 120 dB) generated by a pressure chamber amplifier are studied to determine their effects on the vortex meter. The vortex meter is disturbed when the pulsating frequency is in phase with the vortex cavitation frequency. Perturbations in the velocity profile through curvatures and slide valves lead to meter factor displacement. The residual angular momentum vectors behind a bundle of pipes and behind the aperture plates are in opposite directions. The effects of a chamber curvature without and with the installation of a rectifier are presented. Gas density indicators are used to study the gas type influence with a bifurcated oscillator and a pipe oscillator. The pressure differences depend on the oscillating and sonic velocity and on the gas density. The gas type influence can be corrected by reducing the oscillating velocity of the structure and by applying the error difference of two density indicators with differential oscillating velocity. ESA

VORTEX GAS COUNTER TYPE WBZ 08. PRACTICAL EXPERIENCE [WIRBELGASZAEHLER TYP WBZ 08 - PRAXISERFAHRUNGEN] c35
Hans-Juergen Kastner *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 429-444 In GERMAN (For primary document see N86-30962 22-34)
Avail: NTIS HC A20/MF A01

The performance of the vortex gas counter type WBZ 08 is reviewed. The counter consists of vortex bodies with T profiles, a thermistor for vortex scanning, and an electronic monitoring unit. Error curves from low and high pressure test benches show a measurement accuracy of 0.3%. The vortex gas counter shows good robustness, stability and reproductibility. The theoretical self-cleaning of the vortex bodies through vortex cavitation is confirmed. The theoretical counter factors show good agreement with the ones measured through dry calibration. The functional error safety of the entire measuring facility can be optimized by connecting flow computers. ESA

THE GAS MEASURING BELL: A BASIC NORMAL EQUIPMENT FOR THE REPRESENTATION OF VOLUME UNIT FOR GASES [DIE GASMESSGLOCKE - EIN BASISNORMALGERAET ZUR DARSTELLUNG DER VOLUMENEINHEIT FUER GASE] c35
H. Brunnemann and A. Aschenbrenner *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 445-449 In GERMAN (For primary document see N86-30962 22-34)
Avail: NTIS HC A20/MF A01

A 1 cubic meter gas meter was used to determine the volume unit. A bell cylinder sinks into spindle oil used as a sealing liquid in a bell tank, which causes compression of an air volume. The volume is determined by a geometrical measurement of the bell cylinder along six mantle lines. A table gives the bell volume at 5 mm intervals. The intermediate values can be determined accurately through interpolation. The bell position is determined with an optoelectronic distance indicator with a resolution of 0.01 mm. The conversion of the compressed air

volume to the testpiece can be done with pressure and temperature measurements at different points of the bell and of the testpiece. Evaluation of the measurements is done with a microcomputer. The BASIC software allows the state-dependent calculation of the gas volume, and the representation of the testpiece error curves. A reproductibility of 0.03% and a measuring inaccuracy of the bell of 0.1% are achieved. ESA

A NEW METHOD FOR THE DETERMINATION OF STATIONARY MASS FLOW RATES OF GASES [NEUARTIGES VERFAHREN ZUR BESTIMMUNG STATIONAEREH MASSESTROEME VON GASEN]
L. Narjes and M. Zander *In its* Problems of Large Gas Flow Measurements at High and Low Pressures Jul. 1985 p 450-452 In GERMAN; ENGLISH summary (For primary document see N86-30962 22-34)
Avail: NTIS HC A20/MF A01

The feasibility of a one-step connection of gas measuring instruments was studied. The method consists of a pressure regulator, the gas counter to be checked, a nozzle, and a charging vessel. The method is based on the enthalpy differential equation of the first law of thermodynamics for an open adiabatic system with time-dependent variation of the quantity of energy. Thermostatting of the charging vessel is studied. The method allows instantaneous, dynamic measurement acquisition. ESA

BOUNDARY LAYER EQUATIONS AND METHODS OF SOLUTION
R. Grundmann *In its* Introduction to Computational Fluid Dynamics 1986 31 p (For primary document see N86-30983 22-34)
Avail: NTIS HC A18/MF A01

Laminar boundary layer theory, starting from Prandtl's ideas is described. The hierarchy of the boundary layer equations is discussed, and the relationship of the different types of boundary layer equations to the Navier-Stokes equations is demonstrated. Transformation techniques to reduce the problems of solution are indicated. A generalized discretization scheme is applied to a set of laminar compressible boundary layer equations and a numerical solution scheme for calculating the remaining tridiagonal linear difference equations is shown. A laminar boundary layer along the symmetry line of a highly inclined ellipsoid is calculated. ESA

SOLUTION METHOD OF PARABOLIZED NAVIER-STOKES EQUATIONS
R. Grundmann *In its* Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings 1986 22 p (For primary document see N86-30988 22-34)
Avail: NTIS HC A22/MF A01

Laminar and turbulent incompressible flow through curved channels is studied via artificially parabolized Navier-Stokes equations. It is shown how the laminar secondary flow develops if at the inlet of a streamwise curved channel a rigid body vortex moving in the cross section is prescribed. For low Reynolds numbers where no separation is expected, the fully parabolic Navier-Stokes equations can be applied. Using a grid spacing of 21 x 21 points in the cross flow section, the computer time needed

for one calculation is less than 30sec on a Cray-1S. A solution method for engineering purposes to calculate turbulent flows in curved three dimensional ducts with variable cross sections was developed. Calculation time on the Cray-1S (21 x 21 grid) is less than 48 sec. ESA

NUMERICAL MODELING OF NAVIER-STOKES EQUATIONS
M. Borsboom *In its* Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings 1986 67 p (For primary document see N86-30988 22-34)
Avail: NTIS HC A22/MF A01

It is argued that the relative magnitude of the truncation error rather than the order of accuracy of a discretization scheme determines how well a solution procedure predicts the solution of a system of differential equations. For the numerical simulation of the Navier-Stokes equations at high Reynolds number, this means that only a very small amount of numerical diffusion can be tolerated in regions where the viscous effects are relatively important. A technique using artificial diffusion, in the form of turbulent viscosity, to damp out high frequency modes of solution where a high concentration of grid points is not available, is outlined. The method is extended to blade-to-blade flow calculations and unsteady calculations. The time derivative is considered as a part of the source term, and is discretized in space using a trapeziodal rule. The discretization scheme combines high accuracy on a wide variety of grid structures with ease of programming, as is demonstrated by the calculation of the flow over a backward facing step, where excellent results are obtained using a highly distorted grid. storted grid. INTRODUCTION TO GRID GENERATION SYSTEMS IN TURBOMACHINERY
R. Camarero, B. Ozell, M. Reggio, and A. Caron *In* Von Karman Inst. for Fluid Dynamics Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings 1986 75 p (For primary document see N86-30988 22-34)
Avail: NTIS HC A22/MF A01

Body-fitted curvilinear grid generation for the numerical simulation of three dimensional flow in turbomachines is introduced. The grids yield coordinate curves aligned with the domain boundaries. The numerical scheme for the governing equations is carried out on a rectangular mesh, giving a simpler and more accurate algorithm since bondaries coincide with coordinate grids, and no interpolation is required. The geometric complexity, through the transformation, is imbedded into the coefficients of the governing equations, affording the possibility of writing generalized codes applicable to a variety of geometries. This results in a great saving in the code development effort. ESA

A FUNDAMENTAL STUDY OF DRAG AND AN ASSESSMENT OF CONVENTIONAL DRAG-DUE-TO-LIFT REDUCTION DEVICES
John E. Yates and Coleman duP. Donald Washington NASA Sep. 1986 34 p
(Contract NAS1-18065)
(NASA-CR-4004; NAS 1.26:4004; ARAP-577) Avail: NTIS HC A03/MF A01 CSCL 20D

The integral conservation laws of fluid mechanics are used to assess the drag efficiency of lifting wings, both CTOL and various out-of-plane configurations. The drag-due-to-lift is separated into two major components: (1) the induced drag-due-to-lift that depends on aspect ratio but is relatively independent of Reynolds number; (2) the form drag-due-to-lift that is independent of aspect ratio but dependent on the details of the wing section design, planform and Reynolds number. For each lifting configuration there is an optimal load distribution that yields the minimum value of drag-due-to-lift. For well designed high aspect ratio CTOL wings the two drag components are independent. With modern design technology CTOL wings can be (and usually are) designed with a drag-due-to-lift efficiency close to unity. Wing tip-devices (winglets, feathers, sails, etc.) can improve drag-due-to-lift efficiency by 10 to 15% if they are designed as an integral part of the wing. As add-on devices they can be detrimental. It is estimated that 25% improvements of wing drag-due-to-lift efficiency can be obtained with joined tip configurations and vertically separated lifting elements without considering additional benefits that might be realized by improved structural efficiency. It is strongly recommended that an integrated aerodynamic/structural approach be taken in the design of (or research on) future out-of-plane configurations. Author

PERFORMANCE OF OIL PUMPING RINGS: AN ANALYTICAL AND EXPERIMENTAL STUDY Final Report
M. W. Eusepi, J. A. Walowit, O. Pinkus, and P. Holmes Jan. 1986 233 p
(Contracts DEN3-256; DE-AI01-85CE-50112)
(NASA-CR-175083; DOE/NASA-0256/1; NAS 1.26:175083; MTI-86TR17) Avail: NTIS HC A11/MF A01 CSCL 20D

A steady-state design computer program was developed to predict the performance of pumping rings as functions of geometry, applied loading, speed, ring modulus, and fluid viscosity. Additional analyses were developed to predict transient behavior of the ring and the effects of temperature rises occurring in the hydrodynamic film between the ring and shaft. The analysis was initially compared with previous experimental data and then used to design additional rings for further testing. Tests were performed with Rulon, carbon-graphite, and babbit rings. The design analysis was used to size all of the rings and to select the ranges of clearances, thickness, and loading. Although full quantitative agreement was lacking, relative agreement existed in that rings that were predicted to perform well theoretically, generally performed well experimentally. Some causes for discrepanices between theory and experiment are believed to be due to starvation, leakage past the secondary seal at high pressures, and uncertainties in the small clearances and local inlet temperatures to the pumping ring. A separate preliminary analysis was performed for a pumping Leningrader seal. This anlaysis can be used to predict the film thickness and flow rate thr ough the seal as a function of pressure, speed, loading, and geometry. M.G.

APPLICATION OF A LOW ORDER PANEL METHOD TO COMPLEX THREE-DIMENSIONAL INTERNAL FLOW PROBLEMS Interim Report
Dale L. Ashby and Doral R. Sandlin Dec. 1985 100 p
(Contract NCC2-226)
(NASA-CR-179656; NAS 1.26:179656) Avail: NTIS HC A05/MF A01 CSCL 20D

An evaluation of the ability of a low order panel method to predict complex three-dimensional internal flow fields was made. The computer code VSAERO was used as a basis for the evaluation. Guidelines for modeling internal flow geometries were determined and the effects of varying the boundary conditions and the use of numerical approximations on the solutions accuracy were studied. Several test cases were run and the results were compared with theoretical or experimental results. Modeling an internal flow geometry as a closed box with normal velocities specified on an inlet and exit face provided accurate results and gave the user control over the boundary conditions. The values of the boundary conditions greatly influenced the amount of leakage an internal flow geometry suffered and could be adjusted to eliminate leakage. The use of the far-field approximation to reduce computation time influenced the accuracy of a solution and was coupled with the values of the boundary conditions needed to eliminate leakage. The error induced in the influence coefficients by using the far-field approximation was found to be dependent on the type of influence coefficient, the far-field radius, and the aspect ratio of the panels. [THE NUMERICAL SOLUTION OF THE NAVIER-STOKES EQUATIONS FOR INCOMPRESSIBLE FLOWS AND THE APPLICABILITY OF THE STREAM FUNCTION FORMULATION OF THE NAVIER-STOKES EQUATIONS] Final Report, for 1 Jun. 1982 - 30 Jun. 1985
R. A. Nicolaides Dec. 1985 4 p
(Grant AF-AFOSR-0213-82)
(AD-A166061; AFOSR-86-0070TR) Avail: NTIS HC A02/MF A01 CSCL 20/4

This effort was focused on basic work on the numerical solution of the Navier-Stokes equations for incompressible flows. A basic problem in this theory is the compatibility of the finite element space used to approximate the pressure field. The investigator was able to devise a simple test of the finite element space. An inspection of the solution to this linear system immediately reveals whether the proposed scheme is stable. A second area of activity was an investigation of the applicability of the stream function formulation of the Navier-Stokes equations. This effort resulted in a number of publications in the scientific literature. GRA

AN EVALUATION OF A PARABOLIZED NAVIER-STOKES (PNS) CODE FOR CONE-CYLINDER-FLARED CONFIGURATIONS Final Report, Oct. 1982 - May 1984
Charles J. Cottrell and Gary T. Chapman Apr. 1986 10 p
Previously announced in IAA as A84-42361
(AD-A166650; AFATL-TR-86-16) Avail: NTIS HC A02/MF A01

CSCL 20/4

A Parabolized Navier-Stokes (PNS) code's capability to predict the onset of laminar and turbulent boundary layer separation, forces, moments, and pressure distributions was investigated. Predictions of incipient separation show good agreement with experimental results. Force and moment calculations were found to agree favorably with experimental data for a wide range of geometries for mach numbers from 2 to 4 with turbulent boundary layers. Limited comparison of pressure distribution data also showed good agreement. Skin friction and Stanton number calculations are presented to indicate the code's capability to calculate this information and hence, provide a complete data base for attached flow conditions. The sensitivity of these calculations to smoothing and marching parameter variations was examined and found to be acceptable for most design work. The code was found to be suitable to complement or reduce wind tunnel experimentation for the design of this class of configuration with regard to accuracy, cost and usability. GRA

FLOW MEASUREMENTS IN A CENTRIFUGAL DIFFUSOR TEST DEVICE Final Report, 1 Oct. 1984 - 31 May 1985
Thomas Vitting Jun. 1985 134 p
(Contract N00014-84-C-0766)
(AD-A166758; TR-8501) Avail: NTIS HC A07/MF A01 CSCL 13/7

This work sought to verify concepts used in the design of a large scale, low speed, radial cascade wind tunnel which was to be used to investigate flow phenomena in and the performance of vaned radial diffusors. A major contributor to centrifugal compressor efficiency is the performance of the vaned diffusor which closely follows the impeller of the compressor. The purpose of this diffusor is to efficiently convert most of the kinetic energy of the transonic flow entering the vane into pressure. The need for an experimental facility which could simulate adequately, at low cost and in a controlled way, the environment of the centrifugal compressor motivated the development of the Centrifugal Diffusor Test Device (CDTD). It was expected that the generation of a three dimensional flow would provide improved empirical data on annular cascade performance. This measurement program surveyed the axial and circumferential uniformity of the flow at the inlet of a transonic wedge-type blading mounted in the device. Evaluation of the results showed the flow uniformity to be unsatisfactory. Leakage and other small perturbations in the flow field in the swirl generator are believed to be amplified by the basic flow configuration of the device. GRA

EQUATIONS OF LAMINAR AND TURBULENT FLOWS IN GENERAL CURVILINEAR COORDINATES Technical Report, Nov. 1985 - Feb. 1986
M. C. Richmond, H. C. Chen, and V. C. Patel Feb. 1986 86 p
(Contract N00014-83-K-0136)
(AD-A166837; AD-E950814; IIHR-300) Avail: NTIS HC A05/MF A01 CSCL 20/4

Recent developments in computational fluid mechanics and grid generation have made it possible to consider complex three dimensional laminar and turbulent flows using nonorthogonal coordinates. However, the necessary equations in generalized nonorthogonal coordinates are not readily available in a single reference. The purpose of this report is to present these equations for an incompressible fluid. Methods of curvilinear tensor analysis are used to develop the most commonly used equations. Their relationship with the more familiar equations in orthogonal coordinates is shown. Finally, the practical problems of evaluating the many geometric coefficients which appear in these equations are examined by considering numerically generated coordinates for flow around three dimensional bodies. GRA

ERGODICITY AND MIXING IN A FIVE-MODE SPECTRAL MODEL OF TWO-DIMENSIONAL TURBULENCE Final Report
M. C. Mosher Apr. 1986 29 p
(AD-A166922; DTNSRDC-86/009) Avail: NTIS HC A03/MF A01 CSCL 20/4

A dynamical system derived by truncating to five frequencies a Fourier representation of the Euler equations for incompressible, two dimensional fluid flow is investigated. In using Fourier representations to model turbulence, investigators have assumed that the truncated systems are ergodic and mixing, although the validity of this assumption is an open question. The truncated Fourier system has seven independent constants of motion which define a three dimensional torus. Since a component of the solution to the system is quasiperiodic, the flow of the system can never be mixing and, in particular, cannot be mixing on the three dimensional tours defined by the constants of motion. TURBULENT SHEAR-LAYER/SHOCK-WAVE INTERACTION Conference Report
Eugene F. Brown 1 Apr. 1986 10 p Presented at the Symposium of the International Union of Theoretical and Applied Mechanics on Turbulent Shear-Layer/Shock-Wave Interactions, Palaiseau, France
(AD-A166934; ONRL-C-2-86) Avail: NTIS HC A02/MF A01 CSCL 20/4

This report reviews presentations given at the September 1985 symposium of the International Union of Theoretical and Applied Mechanics and concludes that calculation of two-dimensional shock-wave/boundary-layer interaction problems is advancing well. For three-dimensional flows, accurate numerical calculation needs more experimental data to clarify the mechanisms and flow structures involved. Of greatest priority in this area is obtaining accurate unsteady measurements so that the mechanisms of shock oscillation and its results on the flow field can be better understood. GRA

THREE-DIMENSIONAL SHOCK WAVE AND TURBULENT BOUNDARY LAYER INTERACTIONS Final Report, 1 Aug. 1981 - 31 Jul. 1984
Seymour M. Bogdonoff Sep. 1985 75 p
(Contract F49620-81-K-0018)

(AD-A167086; Rept-1723-MAE; AFOSR-85-1242TR) Avail: NTIS HC A04/MF A01 CSCL 20/4

An extensive experimental study of three-dimensional shock wave turbulent boundary layer interactions caused by shock generators defined solely by angles has been carried out at Mach 3. Sharp fins, sharp swept fins, swept wedges, and semi-cones have been used to generate a wide range of shock waves. The interaction of these waves with turbulent boundary layers has been investigated by surface flow visualization, mean surface static pressure distributions, flowfield surveys of total pressure and yaw, and several flowfield visualization techniques. Some exploratory high frequency surface pressure measurements have been carried out to evaluate the steadiness of these interactions. Scaling laws for both surface and flowfield features have been derived. Some limited studies were carried out at a Mach number of 2. A flowfield study has shown that the initial part of interactions caused by the same strength and geometrical shock wave generated by different shock generators are all similar. The footprints of the interactions, as shown by surface flow visualization, can be categorized as approximately conical or cylindrical, and the boundaries between these two regions have been defined for both Mach 3 and Mach 2. There are still questions with regards to the detailed flowfield structures and physical mechanisms, but the three-dimensional interactions appeared to be less unsteady than that of two-dimensional separated flows. Some procedures have been developed to analyze the flowfield of highly underexpanded axisymmetric ring jets operated at high altitudes. The Method of Characteristics (MOS) was used to compute the Prandtl Meyer expansion fan and flow parameters in that region. The MOC may also be used to obtain some indications about the repetitive expansion compression behavior of the jet as well as the divergent shape of the compression part downstream, when the ambient pressure goes below certain limits. The continuum methods may be used as far as the limit where translational equilibrium ceases to exist. The breakdown of the continuum theory may be evaluated using the experimental breakdown parameter. Beyond this limit, the molecular Direct-Simulation-Monte-Carlo method (DSMC) is applied. The axisymmetric Monte Carlo Simulation begins outside the nozzle, where the breakdown parameter has a value of approximately 0.05. The actual shape of this breakdown limit is a closed lobe surface which starts at the nozzle lips, approximately follows a specific Mach wave in the Prandtl Meyer fan and closes back to the axis far downstream. Because our interest is limited to the close vicinity of the corners, there the shape of this limit may be approximated to a straight line (for an axisymmetric flow making cone). GRA

BURSTS AND PRESSURE FLUCTUATIONS IN TURBULENT BOUNDARY LAYERS Final Report, Nov. 1984 - Nov. 1985
P. Bradshaw and J. F. Morrison Jan. 1986 52 p
(Contract DAJA45-84-C-0049; DA Proj. 1L1-61102-BH-57)
(AD-A167186) Avail: NTIS HC A04/MF A01 CSCL 20/4

Surface pressure fluctuations below turbulent boundary layers were studied, in part, because they can be regarded as footprints of passing turbulent eddies. The pressure fluctuations are formally described by a Poisson equation, implying that the pressure fluctuation at a given point is mathematically represented by the integral of a source term over the whole flow field, with a weighting inversely proportional to the distance of the source from the given point. In turbulent boundary layers, fluctuations were made in a low-speed constant pressure the high-frequency part of the wall pressure fluctuations is generated mainly within the inner layer - say, the first 20% of the boundary layer thickness - and the low-frequency part is generated mainly in the outer layer. Measurements of velocity and surface-pressure turbulent boundary layer well downstream of an extensive region of wall roughness. The turbulence near the wall was representative of a smooth-wall flow, while that in the outer layer was typical of the upper stream rough-wall flow. Comparison with previous measurements on an entirely smooth wall illustrates the relative contributions of the inner and outer layers to the surface pressure fluctuations. GRA

MAP MODELS OF THE TRANSITION TO TURBULENCE IN TWO AND THREE DIMENSIONAL PIPE FLOW
J. A. Viecelli 3 Feb. 1986 42 p
(Contract W-7405-eng-48)
(DE86-006842; UCID-20661) Avail: NTIS HC A03/MF A01

Couette flow, at least when the outer cylinder is fixed, seems to be yielding gradually to theoretical analysis, but Couette flow with the outer cylinder rotating, and Poiseuille flow are still not well understood. These latter cases exhibit a snap transition from laminar to turbulent flow which is not well explained by traditional theory. Certainly, the predictions of linearized stability theory do not agree with observed transition Reynolds numbers, and although a number of nonlinear theories have evolved, they have not been more successful. Especially difficult from the viewpoint of traditional theory is the existence of intermittency; near the Reynolds number at which the flow snaps from laminar to turbulent short burst of turbulence spaced at random intervals are observed. Reported here are studies of the properties of dissipative coupled implicit map models, how they are related to a stochastic model of turbulence, and to the Navier-Stokes equations. Power spectra of the solutions and comparisons of the implicit map model predictions with experimental observations are included. Bifurcation diagrams, velocity profiles, and flow resistance coefficients are covered. Finally, some findings on the general shape of velocity return maps for pipe flow are discussed. DOE

Principles for utilization of binary mixtures and variable temperatures in heat pumps as well as the theory of a compressor heat pump are shortly examined in the report. A theoretical study on liquid cycle process and variable temperatures is made. The mixtures in the study, were the following refrigerants: R22/E181, R22/DMF, R12/R13, R22/R113, and H2O/NH3. The use of binary mixtures in a cold vaporization process was examined by a special test and measuring equipment. At least part of the waste heat of a compressor could be utilized in heating, but the compressor must be then cooled sufficiently. DOE

DRAG OF BODIES OF REVOLUTION IN CAVITATING FLOW
W. L. Oberkampf and W. P. Wolfe 1986 10 p Presented at the 4th Fluid Mechanics Plasma Dynamics and Laser Conference, Atlanta, Ga., 12 May 1986 Previously announced in IAA as A86-38487

(Contract DE-AC04-76DP-00789)
(DE86-005171; SAND-85-2324C; CONF-860517-1) Avail: NTIS HC A02/MF A01

The present paper describes work in progress concerning the fluid dynamics of cavitating flow. The flow field and drag of bodies of revolution at zero angle of attack is predicted for cavity coefficients from fully-wetted flow to sigma = 0. Excellent agreement for drag coefficient is demonstrated between theory and a water tunnel experiment. It is shown that skin friction drag is the dominant drag component for zero cavity coefficient. Excellent agreement is also demonstrated between theory and a high-speed water entry experiment. This agreement corroborates the experimental measurement that the cavity pressure is equal to the water vapor pressure, contrary to low-speed water entry. DOE

SIMULATING SOME STATISTICAL FEATURES OF DUSTY GAS TURBULENT FLOW
A. C. Buckingham 15 Nov. 1985 6 p Presented at the 4th Fluid Mechanics Plasma Dynamics and Laser Conference, Atlanta, Ga., 12 May 1986
(Contract W-7405-eng-48)
(DE86-005774; UCRL-93615; CONF-860517-2) Avail: NTIS HC A02/MF A01

Described is the application of numerical simulations as extensions of turbulent flow experiments. These computations are designed to predict the interactive influences of solid dispersants on the turbulent continuous gas phase that entrains them. Interest derives from the view that these interactions may contribute significant modulating influence to turbulent phase constituent and molecular component evolution, reactive mixing, heat, and mass transfer in solid propellant combustion. The numerical simulation procedure utilizes spectral transform projection and spectral averaging collocation methods to represent the continuous phase Navier-Stokes equations. The continuous phase is iteratively matched at discrete time intervals to a random-walk Lagrangian statistical sampling procedure for the dispersed phase momenta and position expectancies. Ensemble averaging produces statistical velocity moments for both dispersed and continuous phases. DOE

NUMERICAL EXPERIMENTS WITH CONCHAS-SPRAY: INSTALLATION OF THE FLOE ALGORITHM
Lawrence D. Cloutman Feb. 1986 35 p
(Contract W-7405-eng-36)
(DE86-007575; LA-10626-MS) Avail: NTIS HC A03/MF A01

The rezoning phase of the CONCHAS-SPRAY program models the advection terms in the Navier-Stokes equations. Consequently, this code suffers from all the numerical difficulties associated with these terms, except for pure Lagrangian calculations. In particular, the use of any of the available differencing options other than pure donor cell can create artificial oscillations in the solution through the dispersive truncation errors. This report describes the installation of a flux-limiting procedure similar to Chapman's FRAM technique that suppresses these oscillations by locally adding enough donor-cell differencing to prevent nonphysical growth of local maxima and minima. ACOUSTIC DAMPING FOR EXPLICIT CALCULATIONS OF FLUID FLOW AT LOW MACH NUMBER
J. D. Ramshaw, P. J. ORourke, and A. A. Amsden Jan. 1986 15 p
(Contract W-7405-eng-36)
(DE86-007576; LA-10641-MS) Avail: NTIS HC A02/MF A01

A method is proposed for damping the sound waves in explicit calculations of fluid flow at low Mach number, where sound waves are usually not of interest but may distract attention from other flow features. The method is based on the introduction of an artificial pressure q of the form q = - q0rhoc(2)(DELTA)t(del x u - del x u0), where q0 is a coefficient of order unity, rho is the density, c is the sound speed, (DELTA)t is the time step, and u0 is the velocity field that would obtain at zero Mach number. When del x u0 is zero, the method becomes equivalent to the use of an artificial bulk viscosity q0rhoc(2)(DELTA)t. However, del x u0 can be substantially different from zero in problems with heat or mass sources (e.g., combustion), and its inclusion is then essential to obtain the correct pressure field. The method is well suited for use in conjunction with explicit numerical schemes that employ acoustic subcycling or artificial reduction of the sound speed for improved efficiency at low Mach number. The beneficial effects of the method are illustrated by means of calculations with an acoustic subcycling computer program. DOE

INTEGRATED GRADIENTS: A DERIVATION OF SOME DIFFERENCE FORMS FOR THE EQUATION OF MOTION FOR COMPRESSIBLE FLOW IN TWO-DIMENSIONAL LAGRANGIAN HYDRODYNAMICS, USING INTEGRATION OF PRESSURES OVER SURFACES
Philip L. Browne Feb. 1986 86 p
(Contract W-7405-eng-36)
(DE86-008325; LA-10587-MS) Avail: NTIS HC A05/MF A01

This paper describes a method of deriving gradients (that is, accelerations) for difference calculations of the equations of motion (momentum conservation) in two-dimensional Lagrangian meshes in an r-z coordinate system. The method basically considers various ways of defining the masses associated with each vertex and methods of integrating pressures over the surfaces of those masses, and then combining them in various ways to conserve momentum transfer between vertices. These gradients are derived analytically for planes, cylinders, and spheres to test for uniform motion. All results described have been tested with actual numerical calculations. DOE

APPROXIMATE ANALYSIS OF THE FORMATION OF A BUOYANT SOLID SPHERE IN A SUPERCOOLED MELT
A. D. Solomon, D. G. Wilson, and V. Alexiades Mar. 1986 16 p
(Contract DE-AC05-84OR-21400)
(DE86-007882; ORNL-6212) Avail: NTIS HC A02/MF A01

A mathematical model is presented for the idealized formation and development of a buoyant sphere solidifying in an infinite pool of supercooled liquid. The solid and liquid are of the same pure material and the solid is less dense than the liquid. Initially the liquid is at a uniform temperature that is below its equilibrium freezing temperature, T/sub cr/, but above the so called hypercooled temperature, T/sub cr/ - H/c/sub L/. Here H and c/sub L/ are the latent heat of solidification and the specific heat of the liquid, respectively. An approximate solution is derived based on the Megerlin approximation method. DOE

Preparations for the study of naphthalene diffusion dissolved in the supercritical fluids carbon dioxide and ethylene have proceeded as follows. We plan to use the fixed field gradient NMR technique to monitor the diffusion of the dissolved naphthalene. However, the technique is not feasible in systems with spin-spin coupling among the nuclei of interest; unfortunately the protons on naphthalene exhibit this coupling. We thus intend to use totally deuterated naphthalene and monitor the deuterium signal, a nucleus whose coupling is negligible. We therefore have designed and built a new high pressure NMR probe for the measurement of deuterium. This probe is similar to the one used in the previous naphthalene solubility study, and accommodates the same supercritical sample cells. The probe is machined from Vespel SP-1 (a high temperature plastic), and houses a 17-1/2 turn solenoid NMR coil along with thermocouples located slightly above and below the sample area. The probe has been successfully tested to 2 kbar gas pressure. The data acquisition system for the NMR spectrometer used for supercritical fluid studies has been developed and described in this report. DOE

COMPUTER CODE CONDIF-01 (RELEASE 2) FOR TRANSIENT CONVECTIVE-CONDUCTIVE HEAT TRANSFER: USER'S MANUAL
S. Giuliani and H. Laval 1984 85 p
(DE86-780411; EUR-9448) Avail: NTIS (US Sales Only) HC A05/MF A01

CONDIF-01 is a finite element computer code developed at J.R.C. Ispra to solve natural and forced convection problems, for use in Post Accident Heat Removal studies following a hypothetical fast-reactor core meltdown. The new version of the code is capable of analyzing problems in which there exists initially a liquid (solid) region which may change phase to solid (liquid), as time proceeds. A variant of the enthalpy method is employed to model the phase change process. The presence of structures enclosing the liquid (solid) region is accounted for, but such structures are assumed to remain in the solid phase. Plane and axisymmetric situations may be analyzed. The essential characteristics of the code are outlined here. This report gives instructions for preparing input data to CONDIF-01, release 2, and describes two test problems in order to illustrate both the input and the output of the code. DOE

VOID FRACTION MEASUREMENT IN TWO-PHASE FLOW WITH X-RAYS
W. Hufschmidt and E. deClercq 1984 4 p Prepared in cooperation with Commission of the European Communities, Ispra, Italy
(DE86-780422; EUR-9487) Avail: NTIS (US Sales Only) HC A02/MF A01

The exact knowledge of the void fraction in two phase flow systems with water and vapor is of great importance for water reactors. A measurement method not disturbing the fluid flow is the absorption technique x rays. This method has been tested for the present case of small absorption lenghts (about 16mm). In collaboration with the Lehrstuhl fuer Elektronische Schaltungen of the Ruhruniversitaet, Bochum (FRG), a rapid measurement device has been developed using ionization chambers. At present steady state fluid in vertical tubes with homogeneous distribution of the two phase water vapor are tested at pressures in the range from 70 to 150 bars and rather good agreements with calculated values are found. TIME INTEGRATION AND CONJUGATE GRADIENT METHODS FOR THE INCOMPRESSIBLE NAVIER-STOKES EQUATIONS
P. M. Gresho Jan. 1986 25 p Presented at the 6th International Conference on Finite Elements in Water, Lisbon, Portugal, 1 Jun. 1986
(Contract W-7405-eng-48)
(DE86-007177; UCRL-94000; CONF-860681-1) Avail: NTIS HC A02/MF A01

This paper addresses one class of iterative methods that are promising for cost effective Navier-Stokes simulations. The approach is based on the conjugate gradient (CG) method for solving linear algebraic systems with a symmetric positive-definite (SPD) matrix. These methods have many important characteristics: monotone convergence (in an appropriate error norm), optimal error minimization, finite termination, the direct exploitation of sparseness in the matrix, and no need to estimate iteration parameters. DOE

REMARKS ON THE CHOICE OF A STIFF ORDINARY DIFFERENTIAL EQUATION SOLVER FOR THE SOLUTION OF FLUID FLOW PROBLEMS
S. Thompson Mar. 1986 39 p
(Contract DE-AC05-84OR-21400)
(DE86-010080; ORNL-6189) Avail: NTIS HC A03/MF A01

Several aspects of the solution of fluid flow problems are discussed. A model problem is described which captures several of the salient characteristics of such problems. The model problem is derived from the one-dimensional Euler equations. It corresponds to the subcooled liquid region of a three region reactor steam generator model. The defining partial differential equations are discretized spatially using the method of pseudo-characteristics. The resulting system of ordinary differential equations is then solved by the method of lines using each of several available ordinary differential equation (ode) solvers. In addition to demonstrating that fluid flow problems can be solved effectively using adaptive mathematical software, the results also illustrate the typical performance of each solver as well as the relative merits of special solver features (eg., automatic method switching and exploitation of problem sparsity or bandedness). The model problem is also modified and used to illustrate several commonly observed characteristics of fluid flow models. The results illustrate the potential effect of solver performance of characteristics such as inaccurate water property calculations. Consequently, they explain apparent anomalies often attributed incorrectly to poor solver design and algorithmic implementation. The results also support the choice of the sparse ordinary differential solver LSODES for the solution of fluid flow problems. DOE

CHEMICALLY REACTING TURBULENT FLOW Final Report, 1 Oct. 1982 - 30 Sep. 1985
W. M. Pitts and T. Kashiwagi Mar. 1986 43 p Sponsored by AF
(PB86-196722; NBSIR-85/3299) Avail: NTIS HC A03/MF A01 CSCL 20D

Summarized are the results of the first three years of a study on chemically reacting turbulent flow. The development of new diagnostics for variable density flows are described. These include Rayleigh light scattering for real-time, spatially-resolved concentration measurements, combined Rayleigh light scattering and hot-wire anemometry for simultaneous concentration and velocity measurements, and the development of a digital line camera which has allowed the concentration measurements to be made along a line. A study of heat transfer from heated cylinders is discussed which

has generated a much improved correlation of experimental results. These studies have also included a limited investigation of Reynolds number (Re) effects. The observed dependence of the mixing behavior on the density ratio and Re have led us to make new hypotheses concerning the nature of turbulent mixing. GRA

SUPPORT OF THE BALLOON-BORNE ULTRAVIOLET STELLAR SPECTROGRAPH Final Report
J. G. Timothy May 1986 14 p
(Contract NASw-3935)
(NASA-CR-177152; NAS 1.26:177152) Avail: NTIS HC A02/MF A01 CSCL 14B

A (256 x 1024)-pixel imaging ultraviolet Multi-mode Microchannel Array (MAMA) detector system for flight was fabricated, evaluated, and environmentally tested for flight on the Balloon Borne Ultraviolet Stellar Spectrograph (BUSS). The goal of the program was to replace the existing SEC Vidicon with the pulse-counting MAMA detector in order to, first, improve the overall sensitivity of the BUSS telescope and spectrograph for observations of stars down to m sub v = 7 and fainter, and, second, to improve the spectral resolution and wavelength accuracy by eliminating the image drifts in the Vidicon caused by magnetic field effects. A sealed MAMA detector tube structure employing a remotely processed photocathode mounted on a window in proximity focus with the front face of the MCP was developed to avoid contamination produced by a noisy and unstable device. The configuration of the BUSS detector system in its flight ready configuration is shown. The quantum efficiency curve for the semi-transparent Cs2Te photocathode is also shown. E.R.

ANALYSIS OF A DOUBLY COUPLED SINGLE FIBER RESONATOR M.S. Thesis
Richard L. Glover Dec. 1985 67 p
(AD-A166851; AD-E950814; AFIT/CI/NR-86-52T) Avail: NTIS HC A04/MF A01 CSCL 17/7

An analysis of a doubly coupled single fiber resonator has been made. The addition of a second coupler to a typical single coupler resonator with less than 100 percent coupling is shown to greatly improve the finesse and sensitivity to fiber attenuation of the resonator. A simple method of achieving extremely high finesse with approximately 70 percent coupling is also shown. With typical fiber and coupler loss values from the literature included in the calculations, this device shows a minimum detectable signal on the order of 20 picometers as a microbend sensor and .17 microradians per second as a laser gyroscope. GRA

DEVELOPMENT OF A PULSE HEIGHT ANALYZER M.S. Thesis
E. S. Moreira 1984 119 p In PORTUGUESE
(DE86-700768; INIS-BR-387) Avail: NTIS (US Sales Only) HC A06/MF A01

The development of a Pulse Height Analyzer is described. This equipment is essential to analize data coming from detectors producing information codified in pulse amplitudes. The system developed consists of a Signal Input Module connected to a Controller Module based on a 8085A microprocessor capable of memorizing pulses up to 1 uS in 256 channels with a resolution

better than 20 mV. A Communication Module with a serial interface is used for data transfer to a host computer using RS232c protocol. The Monitoring and Operation Module consists of a hexadecimal Keybord, a 6 digit 7-segment display and a XY analog output enabling real time visualization of data on a XY monitor. The hardware and the software designed for this low cost system were optimized to obtain a typical dead time of approximately 100 uS. This device was used to acquire curves at the Small Angle X-ray Scattering Laboratory in this department. The appraratus performance was tested by comparing its data with a Northern Pulse Height Analizer model NS633 output, with favorable results. DOE

AE MONITORING INSTRUMENTATION FOR HIGH PERFORMANCE SUPERCONDUCTING DIPOLES AND QUADRUPOLES, PHASE 2 Progress Report, 1 Feb. 1985 - 31 Jan. 1986
Y. Iwasa 22 Jan. 1986 105 p
(Contract DE-AC02-83ER-40121)
(DE86-007414; DOE/ER-40121/6) Avail: NTIS HC A06/MF A01

In the past year and a half, attention has been focused on the development of instrumentation for on-line monitoring of high-performance superconducting dipoles and quadrupoles. This instrumentation has been completed and satisfactorily demonstrated on a prototype Fermi dipole. Conductor motion is the principal source of acoustic emission (AE) and the major cause of quenches in the dipole, except during the virgin run when other sources are also present. The motion events are mostly microslips. The middle of the magnet is most susceptible to quenches. This result agrees with the peak field location in the magnet. In the virgin state the top and bottom of the magnet appeared acoustically similar but diverged after training, possibly due to minute structural asymmetry, for example differences in clamping and welding strength; however, the results do not indicate any major structural defects. There is good correlation between quench current and AE starting current. The correlation is reasonable if mechanical disturbances are indeed responsible for quench. Based on AE cumulative history, the average frictional power dissipation in the whole dipole winding is estimated to be approx. 10 (MU)W cm(-3). We expect to implement the following in the next phase of this project: Application of room-temperature techniques to detecting structural defects in the dipole; application of the system to other dipoles and quadrupoles in the same series to compare their performances; and further investigation of AE starting current approx. quench current relationship. Work has begun on the room temperature measurements. Preliminary Stress Wave Factor measurements have been made on a model dipole casing. DOE

THEORY AND OPERATION OF THE REAL-TIME DATA ACQUISITION SYSTEM FOR THE NASA-LaRC DIFFERENTIAL ABSORPTION LIDAR (DIAL) Final Report, 1 Jan. - 31 Dec. 1985
Carolyn Butler Jun. 1986 55 p
(Contract NCC1-28)
(NASA-CR-177151; NAS 1.26:177151; GSTR-86-4) Avail: NTIS HC A04/MF A01 CSCL 20E

The improvement of computer hardware and software of the NASA Multipurpose Differential Absorption Lidar (DIAL) system is documented. The NASA DIAL system is undergoing development and experimental deployment at NASA Langley Research Center for the remote measurement of atmospheric trace gas concentrations from ground and aircraft platforms. A viable DIAL system was developed capable of remotely measuring O3 and H2O concentrations from an aircraft platform. Test flights of the DIAL system were successfully performed onboard the NASA Goddard Flight Center Electra aircraft from 1980 to 1985. The DIAL Data Acquisition System has undergone a number of improvements over the past few years. These improvements have now been field tested. The theory behind a real time computer system as it applies to the needs of the DIAL system is discussed. This report is designed to be used as an operational manual for the DIAL DAS. E.R.

DESIGN AND CHEMICAL SYNTHESIS OF IODINE-CONTAINING MOLECULES FOR APPLICATION TO SOLAR-PUMPED I* LASERS Semiannual Progress Report, 1 Jan. - 30 Jun. 1986
Christopher S. Shiner 1986 4 p
(Grant NAG1-437)
(NASA-CR-176854; NAS 1.26:176854) Avail: NTIS HC A02/MF A01 CSCL 20E

The design and chemical synthesis of new media for solar pumped iodine molecule lasers are explored. In an effort to prepare an iodo fluorocarbon compound absorbing strongly at 300 nm or above, the synthesis of perfluoro allylic iodides was investigated. These compounds furnish especially stable allylic radicals upon photodissociation. The desired red shift is anticipated in the absorption maximum could correlate with increasing radical stability. This expectation was based upon the analysis, previously reported, of the structures and absorption maxima of compounds studied earlier. A previously unknown substance was prepared, a prototypical target molecule, perfluoro-3-iodocyclopent-1-ene. It was obtained by reaction of perfluorocyclopentene with sulfur trioxide under the influence of antimony pentafluoride catalyst, followed by treatment of the resulting allylic fluorosulfonate with sodium iodide in sulfoland solvent. Preliminary data indicate that the absorption maximum for the iodo fluorocarbon is not shifted significantly to longer wavelength. It is not certain whether this result reflects an unexpected influence of the cyclic structure upon the position of the absorption maximum. E.R.

Lasing Characteristics of High Quality Nd:YAG Crystals Grown by Temperature Gradient Technique are discussed. A Nd:YAG crystal of 05x50 mm in size was grown by a temperature gradient technique. It has good optical homogeneity (interference fringe number is zero) and an efficiency of 1% at 1 or 2 pps. It is easy to be operated in TEM sub 00 mode. Antireflective Coating has high efficiency at 1.06 micrometers. The error of the two-layer antireflective coating is analysed. It is shown that optical properties of the film composed of non-quarter wavelength stack are more stable that those of the film composed of quarter wavelength stack. The two-layer antireflective film has been made on K9 substrate and Ta2O5 and SiO2 used as coating material. Its reflectivity at one surface is lower than 0.03% and laser induced damage threshold is over 7 GW/cc (at 1.06 micrometer and 1 ns). GRA

(AD-A167087; AFOSR-86-0168TR) Avail: NTIS HC A07/MF A01 CSCL 20/5

The goal of this research program is the development of coherent X-ray sources is the kilovolt range. An initial application of short wavelength radiation in the vacuum ultraviolet region for photoemission studies of GaHz surfaces has been performed demonstrating the feasibility of this class of experiments. A basic and long-standing problem in the field of coherent sources is that associated with the generation of coherent energy in the extreme ultraviolet and soft x-ray regions. During the last three years, picosecond rare gas halogen (RGH) excimert laser technology, on account of the very favorable scaling relationships governing the spectral brightness of these sources, has emerged as a key factor in new techniques useful for generation of coherent radiation below 100 nm. The operation of RGH systems will be extended down into the femtosecond region, a development that will enable sources with peak powers P in the 1TW < or = 10TW range to be used in physical studies. Light sources of this kind should permit the generation of focal intensities above approx 10 to the 20th power S/c c. GRA

TRIPLE CAVITY LASER Patent Application
L. Smith, inventor (to Air Force) Filed 4 Mar. 1986 21 p
(AD-D012292; US-Patent-Appl-SN-836043) Avail: NTIS HC A02/MF A01 CSCL 20/5

The invention comprises a semiconductor laser having an attached etalon which imposes two additional reflective cavity resonance conditions on a laser diode. The etalon has partially reflective front surface and an inner surface which act in conjunction with the internal cavity of the laser diode to reduce side mode emission from the laser. This results in laser emission of a single dominant mode, i.e., a single discrete wavelength of coherent light, from the surface. GRA

OPTIMIZED FLASHLAMP PUMPING OF DISC AMPLIFIERS
J. E. Murray, H. T. Powell, and B. W. Woods 17 Jan. 1986 56 p Presented at the Los Angeles Symposium and Exhibition on Optical and Electro-optical Engineering, Los Angeles, Calif., 19 Jan. 1986
(Contract W-7405-eng-48)
(DE86-007121; UCRL-93321; CONF-860117-6) Avail: NTIS HC A04/MF A01

Disk amplifier design for inertial fusion lasers has evolved with changing fusion-driver requirements from a primary emphasis on gain to a primary emphasis on efficiency. In this paper we compare Shiva and Nova amplifiers to a developmental amplifier (SSA) and show greater than a two-fold improvement in efficiency over past designs under all operating conditions. Experiments to optimize the efficiency of the SSA show that preionization of the flashlamps produces significant benefits and that the packing fraction of lamps is more important than the flashlamp reflector shape. They also show that the optimized flashlamp pulselength and reflector geometry depend on the desired stored energy in the laser medium. We have demonstrated a 7% storage efficiency at a stored fluence per disk of 0.5 J/cm(2) (stored energy density of 0.06 J/cm(3)) and 4% at 2.0 J/cm(2) (0.25 J/cm(3)). Comparison of SSA measurements with storage-efficiency calculations show that our flashlamp model accurately predicts the single-pass pumping of disk amplifiers. DOE

INVESTIGATION OF OPTICAL DAMAGE VIA RESONANCE IONIZATION MASS SPECTROMETRY
R. C. Estler and N. S. Nogar 1985 7 p Presented at the 17th Annual Symposium on Optical Materials for High-Power Lasers, Boulder, Colo., 28 Oct. 1985
(Contract W-7405-eng-36)
(DE86-007369; LA-UR-86-769; CONF-851052-4) Avail: NTIS HC A02/MF A01

Resonance ionization mass spectrometry (RIMS) has been used as a diagnostic for interrogating optical damage events. RIMS involves multistep laser photoionization, generally through real intermediate states, followed by mass separation and detection. It is a sensitive and selective means of detection, and has the potential for detection of ultratrace inclusions in substrates and/or coatings. In initial experiments, damage on uncoated CaF2 substrates was initiated by pulses of 1.06-(MU)m light from a Q-switched ND(+3):YAG laser. Interrogation of the spalled plume revealed CaF radicals only when damage events occurred. No Ca atoms were observed, and no attempt was made to detect F atoms or CaF2. In subsequent experiments conducted at laser intensities below the damage threshold, we observed the presence of surface adsorbents and a correlation between the presence of the adsorbents and the occurrence of optical damage. FREE-ELECTRON LASERS FOR STRATEGIC DEFENSE: THE BENEFITS OF SCIENTIFIC OPEN SCIENTIFIC EXCHANGE
W. A. Barletta 24 Feb. 1986 8 p Presented at the International Seminar on Nuclear War, Erice, Italy, 19 Aug. 1985
(Contract W-7405-eng-48)
(DE86-008033; UCRL-94166; CONF-8508154-3) Avail: NTIS HC A02/MF A01

A dominant theme of the Fifth International Seminar on Nuclear War, held at Erice, Sicily, (August 19-24, 1985), was the appeal for openness in science and in technological research. In his address to the seminar, Italian Foreign Minister Giulio Andreotti cited the remarkable achievements at the European Center for Nuclear Research (CERN), as an inspiring example of the benefits of scientific collaboration across national borders - science without frontiers. Dr. Edward Teller eloquently argued that, thanks to a nearly complete lack of official secrecy, computer technology has flourished in the free societies of the United States, Japan, and Western Europe. The superiority of this technology, vis-a-vis its status in the Soviet bloc, has enhanced both the national security and the economic vitality of the United States and its allies. A further example of the success of science without secrecy can be found in another technology of major importance to the goals of America's Strategic Defense Initiative (SDI). The technology of note is the free electron laser (FEL). DOE

BETATRON MOTION AND OPTICAL DEFLECTION IN FREE ELECTRON LASERS
T. J. Karr Oct. 1985 49 p
(Contract W-7405-eng-48)
(DE86-009556; UCRL-53718) Avail: NTIS HC A03/MF A01

Transverse displacement of the electron beam at input to the wiggler induces betatron oscillation, imparting a sinusoidal transverse displacement to the gain medium seen by the optical beam. As the light propagates down this rippled medium it is guided by the dispersion, thereby acquiring some transverse sinusoidal displacement. At output from the wiggler the optical beam in general has acquired some transverse component of velocity, that is, it propagates off-axis. As the e-beam displacement fluctuates statistically with every pulse, the optical output direction jitters around the nominal axis. The jitters is estimated with a model that includes off-axis optical propagation through a rippled gain medium but neglects feedback of the off-axis light on the e-beam. The model is solved in perturbation theory. The jitter is calculated at the final aperture of the optical system beyond the wiggler. DOE

FUEL COMPONENT AND HETEROATOM EFFECTS ON DEPOSITS AND WEAR Interim Report, 1 Oct. 1981 - 30 Sep. 1984
E. A. Frame Dec. 1985 50 p
(Contracts DAAK70-85-C-0007; DAAK70-82-C-0001)
(AD-A166839; AD-E950814; BFLRF-190) Avail: NTIS HC A03/MF A01 CSCL 21/4

The objective of this project was to investigate the effects of fuel heteroatom compounds on diesel engine performance, particularly engine deposition and wear. This work involved operating a single-cylinder diesel research engine using a highly controlled base fuel (JP-7) which was extremely low in sulfur and nitrogen. The engine lubricant was a synthetic polyalphaolefin material, also free of sulfur and nitrogen. Thus, wear and deposit effects observed during the 60-hour single-cylinder laboratory engine test were directly related to the heteroatom compound added to the base fuel. Through these controlled laboratory engine tests, wear and deposit effects were studied using four different types of known fuel sulfur complexes, and two different fuels containing naturally occurring sulfur compounds. Fuel sulfur type did not appear to directly influence wear rate, whereas the disulfide-type sulfur was found to produce high piston deposit tendencies. No increase in engine wear was observed for three fuels each of which contain a different known nitrogen compound. Fuel injector deposits and fouling occurred with some of the nitrogen-containing fuels. A fuel containing a combination of both known sulfur and nitrogen hetero-atoms was tested and no synergistic effects on wear or deposits were observed. GRA

LOW TEMPERATURE RATE CONTROLLER Patent
Arthur Holmberg, Jr. and Earl M. Altman, inventors (to Air Force) Issued 25 Feb. 1986 4 p Supersedes AD-D011029
(AD-D012277; US-Patent-4,572,488; US-Patent-Appl-SN-559612; US-Patent-Class-267-8R) Avail: NTIS Avail: US Patent and Trademark Office CSCL 22/2

This invention relates generally to shock absorbers, and, more particularly, to shock absorbers that are used in outer space applications. The present invention uses a pair of flexible metal bellows sealed to a piston and a housing by continous welds. A gas occupies sealed volumes external to the bellows on either side of the piston and is metered through a resistive channel to that volume on the opposite side of the piston. A center volume between these volumes is open to the external environment. This center volume, is a typical shock absorber, internal to the two bellows is filled with a damping fluid. An actuator rod is attached to the piston and one end is attached to a load while the other end is attached to a stable platform. A spring that is used to drive the load in a given direction is attached to the rod and motion thereof is damped by the rate controller. One object of the present invention is to provide in outer space. Another object of the present invention is to provide a rate controller that is hermetically sealed. GRA

Robotic vehicles offer potential to the Army for force multiplication and removing the soldier from hazardous environments. The Army robotic vehicle program will provide a supervised autonomy capability with full battlefield mobility. To accomplish this the control system will require a person in the control loop at least part of the time. The Army program incorporates several technologies including a digital terrain data base, product generation capabilities, stereo vision, and an inertial position and attitude unit. These technologies allow for vehicle operation over-the-hill and beyond line-of-sight. This paper will discuss the detailed use of terrain data and terrain data products, such as route planning and three-dimensional synthetic scenes, in the interactive control of a robotic vehicle. Of particular importance is the relation of the terrain data to the vision data and position and attitude data. This paper will also discuss the similarities and difference between GIS requirements for interactive robotic vehicle control and autonomous vehicles, such as in the DARPA Autonomous Land Vehicle Program. DOUBLE-STAGE AIR FILTER Patent Application
W. D. Craig, inventor (to Navy) Filed 10 Feb. 1986 20 p
(AD-D012307; US-Patent-Appl-SN-827589) Avail: NTIS HC A02/MF A01 CSCL 13/11

This patent application discloses an improved double-stage air filter of modular construction for attachment between aligned openings of a spaced double wall structure to supply filtered air flow to a controlled area. The filter is generally made up of casing means and combined plate means and sleeve means. Both the casing means and plate are provided with a flange means. The sleeve means is provided with a series of perforations and the plate means flange means is provided with a plurality of relatively

spaced slots. The casing means flange means is affixed to the outer wall so that the casing means extends between the walls. The plate means includes retainer means that is affixed to the inner wall so that the sleeve means is inserted in the casing means. Inner and outer filter means for cleaning and purifying an air flow are disposed about the sleeve means. Retainer means are connected to the casing means flange means so as to hold the filter means in sealing engagement between the last mentioned retainer means and the plate means. During filter use, an airflow to be filtered is directed through the sleeve perforations, the filter means, and the slots of the plate flange means thereby supplying filtered air to the controlled area. (Contract DE-FG01-82CE-15141)
(DE86-005095; DOE/CE-15141/T1) Avail: NTIS HC A05/MF A01

The engine heating device development project was supported by DOE grant No. DE-FG01-82CE15141. The engine heating device recovers waste engine exhaust heat and stores it for later use in rewarming the cold engine prior to starting. Heat is stored in the phase change and sensible heat capacity of a storage material. This device finds application in the cold weather starting of gasoline and diesel engines. During the grant period three major technical issues were addressed: (1) design optimization; (2) quantifying device performance, and (3) field testing. Two totally different designs were looked at during design optimization, i.e., a horizontally mounted unit and a vertically mounted unit. The latter, with its up and down concentric flow pattern, proved to be the best design. This is because of its superior heat storage ability and its simpler design. A number of different heat storage materials were looked at during this stage of the program. The material selected best for this application was Lithium Nitrate (LiNO3). A problem of low heat transfer rates from the heat storage material was solved by the insertion of wire mesh into the storage material. DOE

TRITIUM GAS TRANSFER PUMP DEVELOPMENT
C. L. Sharpe 1985 14 p Presented at the 46th DAMSUL Committee Meeting, Oak Ridge, Tenn., 5 Jun. 1985
(Contract DE-AC09-76SR-00001)
(DE86-007164; DP-MS-85-108; CONF-8506255-1) Avail: NTIS HC A02/MF A01

Non-lubricated, hermetically sealed pumps for tritium service have been selected to replace Sprengel pumps in the existing Tritium Facility. These pumps will be the primary gas-transfer pumps in the planned Replacement Tritium Facility. The selected pumps are Metal Bellows Corporation's bellows pumps and Normetex scroll pumps. Pumping range for a Normetex/Metal Bellows system is from 0.01 torr suction to 2300 torr discharge. Performance characteristics of both pumps are presented. DOE

PREDICTION OF ELECTRON BEAM WELDING DEPTH OF PENETRATION
W. H. Giedt Feb. 1986 26 p
(Contract DE-AC04-76DR-00789)
(DE86-007837; SAND-86-8205) Avail: NTIS HC A03/MF A01

Analytical and experimental results showing the relationship between electron beam welder settings and penetration depth were reviewed. This led to the development an equation for representing the relation between partial penetration and the independent variables involved in electron beam welding. Beam focus current deviation was found to have the greatest influence on predicted penetration. The priority for precision in machine settings was concluded to be: (1) optimum beam focus current; (2) beam voltage or current; (3) travel speed; and (4) focus coil to work distance. M.G.

ZIRCONIA TO CAST IRON BRAZING FOR UNCOOLED DIESEL ENGINES
M. L. Santella, J. P. Hammond, S. A. David, and W. A. Simpson 1985 8 p Presented at the 21st Automotive Technology Development Contractors' Coordination Meeting, Dearborn, Mich., 14-17 Nov. 1983
(Contract DE-AC05-84OR-21400)
(DE86-008982; CONF-8510103-7) Avail: NTIS HC A02/MF A01

Partially stabilized zirconia has been successfully brazed to nodular cast iron by the active substrate process. The process involves coating the ceramic with an agent that promotes wetting and allows the use of commercially available ductile brazing alloys. Process details and the microstructure of zirconia-cast iron joints are described. A method of testing the shear strength of braze interfaces is outlined, and data for zirconia interfaces tested at 25 and 400(0)C are presented. Joints between zirconia and cast iron or titanium develop shear strengths typically in excess of 130 MPa at 25(0)C, but strength at 400(0)C is lower. The reduced strength is related to porosity in the braze joints, and a means of eliminating this porosity is discussed. Preliminary observations indicate that aging at 400(0)C produces no major microstructural changes in the braze joints. Also, the brazing of 115-mm-diameter discs of zirconia and cast iron, and the nondestructive examination of these brazements, is discussed. DOE

DUTY CYCLE TESTING AND PERFORMANCE EVALUATION OF THE SM-229 TELEOPERATOR
R. S. Stoughton and D. P. Kuban Nov. 1985 28 p Presented at the 20th Aerospace Mechanism Symposiu, Cleveland, Ohio, 7 May 1986 Prepared in cooperation with Oak Ridge National Lab., Tenn.
(Contract DE-AC05-84OR-21400)
(DE86-004780; CONF-860560-1) Avail: NTIS HC A03/MF A01

This paper contains the first known experimental studies and analyses of teleoperator performance for specific duty cycles. The results are presented in two distinct areas as position usage patterns, and as three-dimensional power grids. The position usage patterns are a valuable means to assess the available motion range. The power grids are a unique concept for evaluating joint performance. Final conclusions contain recommendations to upgrade the teleoperator for optimum performance. DOE

OIL HYDRAULICS IN ARCTIC REGIONS
H. Vainio, M. Lehmusto, and S. Mikkonen Dec. 1984 37 p In FINNISH
(DE86-751569; VTT-TIED-395) Avail: NTIS (US Sales Only) HC A03/MF A01

Oil hydraulics in arctic conditions has been studied. Seals, oils and hydraulic motors were tested down to the temperature -50 deg C. Some seals operated satisfactory at the temperature -50 deg C when lightly loaded. Because of good viscosity properties the hydraulic oils used for aeroplanes are well suited for use in cold environments. High speed low torque-hydraulic motors operated satisfactory in cold environment. A hydraulic system of a cargo hatch in an arctic vessel was tested in a cold room. The effects of large differences in temperature must be taken into account when planning hydraulic systems. DOE

ROBOT-ASSISTED TORQUE MEASUREMENT
J. R. Lembke Mar. 1986 27 p
(Contract DE-AC04-76DP-00613)
(DE86-009129; BDX-613-3478) Avail: NTIS HC A03/MF A01

An Intelledex 605T robot was used to evaluate the feasibility of automating the measurement of rotary solenoid torque, with the goal of improving productivity. The solenoid chosen for the evaluation is expected to be produced in relatively large quantities for several programs. A new measurement concept was devised, in which the robot connects the solenoid shaft to a torque sensor,

rotates the solenoid housing, and correlates rotational data with digitized torque measurements. Prototype tooling was designed and fabricated, and the measurement concept was evaluated in comparison with the manual method which is presently used. The automatic robot-based measurement system was shown to yield results that are in good agreement with manual measurements. The technique automatically performs all necessary operations once the solenoids have been placed into a part loading fixture, with a cycle time significantly reduced from the manual method. Manual interpretation of chart data is not required, because the results are digitized. The system can compare the measured torque to specification limits and can provide a printed report of acceptance or rejection. its and can provide a printed report of acceptance or rejection. DOE

CALORIMETRY OF PULSED VERSUS CONTINUOUS GAS TUNGSTEN ARC WELDS
G. A. Knorovsky and P. W. Fuerschbach 1986 19 p Presented at the ASM International Trends in Welding Research Meeting, Gatlinburg, Tenn., 18 May 1986
(Contract DE-AC04-76DP-00789)
(DE86-009285; SAND-86-0818C; CONF-860594-1) Avail: NTIS HC A02/MF A01

A technique to measure heat input to welds is used in conjunction with metallography to compare the heat inputs, penetrations, volumes melted, and arc and melting efficiencies of pulsed versus conventional Gas Tungsten Arc autogenous standing edge welds in thin gauge 304L stainless steel. These results are a necessary link between computer models and real weld machine settings. Results show that machine output and heat input correlate better with RMS values of current than with average values. Arc efficiency increased slightly and melting efficiency increased dramatically for increased travel speed at nominally constant heat inputs. Also, for two conditions of average current and travel speed corresponding to similar nominal heat inputs, one an efficient combination (81 amps at 12.2 mm/s) the other an inefficient combination (42 amps at 6.3 mm/s), current pulsing increased penetration only for the inefficient case. Comparing the processes on the basis of penetration divided by heat input, the continuous weld made under efficient conditions was best. However, some nonreproducible pulsed welds gave an exceptionally high value for this parameter. It is believed that resonance between the liquid pool motion and the pulse frequency may explain this phenomenon. DOE

GAS-ENGINE HEAT PUMP TEST PROCEDURES Topical Report, Oct. 1985 - Feb. 1986
S. G. Talbert and A. L. Rutz Apr. 1986 67 p
(Contract GRI-5084-242-1118)
(PB86-201662; GRI-86/0083) Avail: NTIS HC A04/MF A01 CSCL 13A

The purpose is to establish standardized procedures for testing gas engine-driven heat pumps,and to define the various engine heat pump performance factors. The recommended test methods outlined should enable Gas Research Institute to better monitor the several research projects now underway to develop gas engine heat pumps for residential and light commercial use. Altogether, 17 performance test points are described which will be sufficient to describe the heating and cooling performance of a variable speed heat pump over its expected range of outdoor temperatures. The tests include 11 steady-state tests, two part-load tests one defrost test, one auxiliary heater test, and two domestic water heating tests. Equations and procedures also are outlined so that the various heat pump performance factors can be calculated, as well as its expected seasonal and annual performance. GRA

DESIGN OF BOLTED JOINTS IN COMPOSITES
1985 27 p Presented at the 60th Meeting of the Structures and Materials Panel of AGARD, San Antonio, Tex., 21-26 Apr. 1985
(AGARD-R-727; ISBN92-835-1531-5) Avail: NTIS HC A03/MF A01

This publication contains three papers heard by the Structures and Materials Panel Sub-Committee on Mechanically Fastened Joints in Composites. The papers survey the various parameters governing the behaviour of bolted joints, and give some experimental data representative of behaviour under load. It is concluded that poor static strength, rather than good fatigue strength, is a characteristic of this type of joint; a Panel Specialists Meeting is to review the topic. Author

IMPROVED MAGNETIC PARTICLE INSPECTION OF SMALL THREADED FASTENERS
J. A. Brunk Mar. 1986 21 p
(Contract DE-AC04-76DP-00613)
(DE86-009324; BDX-613-3283) Avail: NTIS HC A02/MF A01

Magnetic particle inspection is required for over 100 types of threaded fasteners used at Bendix Kansas City Division of Allied Corporation. Most are purchased screws and bolts made to AN, MS, and NAS specifications. These specifications invariably require that testing be in accordance with MIL-I-6868E, Inspection Process, Magnetic Particle. This specification includes directions for magnetization of test objects that are inappropriate for many small parts, particularly for screws and bolts of less than about 8-mm thread diameter. Following those directions is more likely to interfere with the detection of serious defects than to ensure that they will be found. Alternate testing techniques that make it easier to find and correctly interpret defect indications have been developed. A new semiautomatic magnetic particle testing machine for threaded fasteners and other small parts up to 9.5 mm in

diameter and 150 mm in length is being built to BKC specifications, with delivery scheduled for April, 1985. Interim procedures using existing equipment have been adopted to improve the reliability of magnetic particle inspection of small fasteners. DOE

EXPERIMENTAL AND ANALYTICAL RESULTS OF LARGE-SCALE PRESSURIZED THERMAL SHOCK TESTING
A. Sauter, H. Huber, and T. Nguyen-Huy 1986 33 p Transl. into ENGLISH from "Experimentelle und Analytische Ergebnisse eines Grossversuchs zur Notkuehlsimulation" Stuttgart, West Germany 33 p Presented at the 11th MPA Seminar, Stuttgart, West Germany, 10-11 Oct. 1985
(BLL-Risley-TR-5282-(9091.9F)) Avail: British Library Lending Div., Boston Spa, England

The systems engineering activity concentrated on evaluation of emission model characteristics and the requirements they impose on the Orbit Transfer Vehicles (OTV), establishing debris/meteoroid shielding criteria, and updating Mission and Systems Requirements document. The Macintosh based computer system was expanded to encompass performance calculations coupled with the mission model. Two configuraton updates were indicated for the baseline vechicles: the ground based vehicle will have debris/meteoroid shielding added to the propellant tanks; the space based vehicle will be resized to accommodate the new driving manned GEO sortie mission (probably to the vicinity of 75,000 pounds propellant load). The optimum cargo bay appears to be tending towards the shortest possible configuration, the torous LOX tank version. The definition of the aeroassist trade vehicles is progressing, but conclusions are not yet available. The trajectory control evaluations were conducted for all 14 STS upper atmosphere profiles, and the guidance algorithm performs accurately in all cases. B.G.

SENSTITIVTY ANALYSIS AND OPTIMIZATION OF NODAL POINT PLACEMENT FOR VIBRATION REDUCTION
Jocelyn I. Pritchard, Howard M. Adelman, and Raphael T. Haftka (Virginia Polytechnic Inst. and State Univ., Blacksburg.) Jul. 1986 34 p
(NASA-TM-87763; NAS 1.15:87763) Avail: NTIS HC A03/MF A01 CSCL 20K

A method is developed for sensitivity analysis and optimization of nodal point locations in connection with vibration reduction. A straightforward derivation of the expression for the derivative of noda' locations is given, and the role of the derivative in assessing design trends is demonstrated. An optimization process is developed which uses added lumped masses on the structure as design variables to move the node to a preselected location - for example, where low response amplitude is required or to a point which makes the mode shape nearly orthogonal to the force distribution, thereby minimizing the generalized force. The optimization formulation leads to values for added masses that adjust a nodal location while minimizing the total amount of added mass required to do so. As an example, the node of the second mode of a cantilever box beam is relocated to coincide with the centroid of a prescribed force distribution, thereby reducing the generalized force substantially without adding excessive mass. A comparison with an optimization formulation that directly minimizes the generalized force indicates that nodal placement gives essentially a minimum generalized force when the node is appropriately placed. AEROELASTIC CONSIDERATIONS FOR TORSIONALLY SOFT ROTORS
Wayne R. Mantay and William T. Yeager, Jr. Aug. 1986 20 p Presented at the AHS 2nd Decennial Specialists' Meeting on Rotorcraft Dynamics, Moffett Field, Calif., 7-9 Nov. 1984
(NASA-TM-87687; NAS 1.15:87687; USAAVSCOM-TR-86-B-1)
Avail: NTIS HC A02/MF A01 CSCL 20K

A research study was initiated to systematically determine the impact of selected blade tip geometric parameters on conformable rotor performance and loads characteristics. The model articulated rotors included baseline and torsionally soft blades with interchangeable tips. Seven blade tip designs were evaluated on the baseline rotor and six tip designs were tested on the torsionally soft blades. The designs incorporated a systemmatic variation in geometric parameters including sweep, taper, and anhedral. The rotors were evaluated in the NASA Langley Transonic Dynamics Tunnel at several advance ratios, lift and propulsive force values, and tip Mach numbers. A track sensitivity study was also conducted at several advance ratios for both rotors. Based on the test results, tip parameter variations generated significant rotor performance and loads differences for both baseline and torsionally soft blades. Azimuthal variation of elastic twist generated by variations in the tip parameters strongly correlated with rotor performance and loads, but the magnitude of advancing blade elastic twist did not. In addition, fixed system vibratory loads and rotor track for potential conformable rotor candidates appears very sensitive to parametric rotor changes. Author

STRESS ANALYSIS OF THE CRACKED LAP SHEAR SPECIMENS: AN ASTM ROUND ROBIN
W. S. Johnson Aug. 1986 87 p
(NASA-TM-89006; NAS 1.15:89006) Avail: NTIS HC A05/MF A01 CSCL 20K

This ASTM Round Robin was conducted to evaluate the state of the art in stress analysis of adhesively bonded joint specimens. Specifically, the participants were asked to calculate the strain-energy-release rate for two different geometry cracked lap shear (CLS) specimens at four different debond lengths. The various analytical techniques consisted of 2- and 3-dimensional finite element analysis, beam theory, plate theory, and a combination of beam theory and finite element analysis. The results were examined in terms of the total strain-energy-release rate and the mode I to mode II ratio as a function of debond length for each specimen geometry. These results basically clustered into two groups: geometric linear or geometric nonlinear analysis. The geometric nonlinear analysis is required to properly analyze the CLS specimens. The 3-D finite element analysis gave indications of edge closure plus some mode III loading. Each participant described his analytical technique and results. Nine laboratories participated. Author

STRUCTURAL INELASTICITY 28: A FINITE ELEMENT VECTORIZATION METHOD FOR THE SOLUTION OF CRACK GROWTH PROBLEMS IN 2 OR 3 DIMENSIONS Final Report
Philip G. Hodge, Jr. Feb. 1986 34 p
(Contract N00014-82-K-0020)
(AD-A166545; AEM-H2-4) Avail: NTIS HC A03/MF A01 CSCL 20/11

A summary and bibliography are presented of the investigations of structural inelasticity. Research conducted under this contract included two distinct projects. The first was concerned with using simple truss models to illustrate certain critical aspects of nonlinear material behavior. The other project was concerned with using a constant-strain finite element method to find complete solutions for the stress and displacement in a plate with a centered crack. The elastic solution was obtained first. The elastic/plastic solution was completed after the expiration of this contract. GRA

USE OF THE SHADOW SPOT METHOD IN EVALUATING J FOR DUCTILE STEELS
A. Marchand, L. B. Freund, C. C. Ma, and J. Duffy Feb. 1986 50 p
(Contract N00014-85-K-0597)
(AD-A166834; ONR-0597/1) Avail: NTIS HC A03/MF A01 CSCL 20/11

Caustic curve patterns obtained by the shadow spot method have been used in the past to give direct optical measurement of the elastic stress intensity factor in nominally brittle material. An advantage of the optical shadow spot method is that it provides a direct measure of the intensity of the crack tip stress field. The method is based on the idea that the value of the stress intensity factor can be related to features of the optical field obtained by transmitting parallel light through the crack tip region of a transparent specimen or by reflecting light from the surface of an opaque specimen. Most structural materials that contain cracks undergo substantial plastic deformation under rising load prior to onset of crack growth. Recently, the range of applicability of the shadow spot method was extended to the elastic-plastic power hardening materials. It was noted that the value of Rice's J-integral can be viewed as a plastic strain intensity factor. Methods for measuring values of J for ductile fracture specimens are available but the methods are indirect, in the sense that values of J are inferred from other measured quantities, typically load-deflection data. The shadow spots obtained in the test should be formed by reflection of light arrays from points well within the crack tip plastic zone where the one parameter plastic intensity singular field is dominant. The method of caustics provides a measurement which is customarily interpreted on the basis of plane stress. GRA

THE STRESS INTENSITY FACTOR HISTORY DUE TO THREE DIMENSIONAL TRANSIENT LOADING OF THE FACES OF A CRACK
L. B. Freund Feb. 1986 28 p
(Contract N00014-85-K-0597; Grant NSF MSM-85-13096)
(AD-A166835) Avail: NTIS HC A03/MF A01 CSCL 20/11

A procedure is described for determining dynamic stress intensity factor histories for a half plane crack in an otherwise unbounded elastic body, with the crack faces subjected to tractions that result in variation of the stress intensity factor along the crack edge. The procedure is based on integral transform methods and the properties of analytic functions of a complex variable. The procedure is illustrated for the case of a pair of opposed line loads suddenly applied on the crack faces along a line perpendicular to the crack edge. An exact expression is obtained for the resulting mode I stress intensity factor as a function of time for any point along the crack edge. Some features of the solution, as well as possible extensions of the procedure, are discussed. Author (GRA)

A DESIGN METHOD FOR AUTOFRETTAGED THICK-WALLED CYLINDERS WITH OUTSIDE DIAMETER DISCONTINUITIES Final Technical Report
J. J. Busuttil, Jr. and J. A. Kapp Feb. 1986 29 p
(AD-A166881; AD-E440321; ARCCB-TR-86009) Avail: NTIS HC A03/MF A01 CSCL 20/11

A design method has been developed to determine the fatigue life of thickwalled autofrettaged cylinders containing outside diameter (OD) notches which act as failure initiation sites. The method uses local strain analysis for fatigue crack initiation and fracture mechanics analysis for crack propagation to failure. The method is relatively easy to program and thus can be used to optimize cylinder designs with respect to OD initiated failures. The computer program developed requires only minimal input to estimate life: cylinder dimensions, notch depth and root radius, internal pressure, and material yield strength. Other material properties (low cycle fatigue data, fracture toughness, and crack growth law) and permanently stored. The program calculates the elastic stress concentration factor using a Neuber diagram as a default. If the elastic kt is known from other sources, this feature of the program can be overridden. The stress concentration factor is used to calculate notch root stresses from which local strains are estimated. Once the local strains are known, crack initiation life is estimated using the stored low cycle fatigue data. A crack is then assumed to exist and a power law is integrated to determine crack propagation life to failure. The total life is the sum of the initiation and propagation lives. The applicability of the design method is demonstrated by using it to predict the total fatigue lives of existing cylinder designs with measured fatigue lives. GRA

DYNAMIC RESPONSE OF RANDOM PARAMETERED STRUCTURES WITH RANDOM EXCITATION
L. J. Branstetter and T. L. Paez Feb. 1986 161 p
(Contract DE-AC04-76DP-00789)
(DE86-007246; SAND-85-1175) Avail: NTIS HC A08/MF A01

A Taylor series expansion technique is used for numerical evaluation of the statistical response moments of a linear

multidegree of freedom (MDF) system having random stiffness characteristics, when excited by either stationary or nonstationary random load components. Equations are developed for the cases of white noise loading and single step memory loading, and a method is presented to extend the solution to multistep memory loading. The equations are greatly simplified by the assumption that all random quantities are normally distributed. A computer program is developed to calculate the response moments of example systems. A program user's manual and listing (DYNAMO) are included. Future extensions of the work and potential applications are discussed. DOE

DYNAMIC RESPONSE MOMENTS OF RANDOM PARAMETERED STRUCTURES WITH RANDOM EXCITATION
L. J. Branstetter and T. L. Paez 1986 8 p Presented at the 3rd ASCE Engineer Mechanics Specialty Conference on Dynamic Response of Structures, Los Angeles, Calif., 31 Mar. 1986
(Contract DE-AC04-76DP-00789)
(DE86-004567; SAND-85-1887C; CONF-860371-1) Avail: NTIS HC A02/MF A01

First and second order statistical response are formulated for linear multi-degree of freedom dynamical systems having both random load and random structural characteristics. A matrix, ordinary differential equation describing system response is discretized in time, integrated, and then rewritten in the form of a Taylor series expansion of each random element about its mean value. This equation is then used to form response moment expression. Evaluation of the moments is made possible by the development of useful recursive formulas. Results are verified with analytic solutions. The method is useful for the analysis of static or dynamic random response. DOE

TWO-SURFACE PLASTIC MODEL FOR CONCRETE AND GEO-MATERIALS
J. C. Chern, F. B. Lin, and A. H. Marchertas 1986 7 p Presented at the International Conference on Computational Mechanics, Tokyo, Japan, 25 May 1986 Prepared in cooperation with National Taiwan Univ., Taipei and Northwestern Univ., Evanston, Ill.
(Contract W-31-109-eng-38)
(DE86-007475; CONF-860585-1) Avail: NTIS HC A02/MF A01

A constitutive model based on the elastic-plastic formulation coupled with the critical state theory used in soils is presented. A conventional elastic-plastic model is applied to represent the structural behavior up to the maximum strength capacity of material. Beyond this point, the modified critical state theory is used to simulate the material response. In this way, the softening (or hardening) of the material can be accounted for. The softening (or hardening) of the material is facilitated by the shrinkage (or expansion) of a limiting surface in the stress space. This surface is assumed to coincide with the failure surface at the maximum strength of material. It is derived with the help of the five-parameter Willam-Warnke failure surface. The shape of the limiting surface has the same angular dependence as the failure surface of the deviatoric plane. In the meridian plane, the shape is assumed to be that of a slanted ellipse. The described constitutive model is very simple, requiring a minimum of experimental data for input. It is applicable to concrete, geomaterials, and other materials which have different strengths in tension and compression. DOE

FLEXURE STRENGTH ANALYSIS OF LOS ALAMOS CERAMIC BODIES Al-13, Al-18, AND MgO-Y2O3
Jack H. Enloe, Frank G. Gac, and Eralio J. Trujillo Feb. 1986 29 p
(Contract W-7405-eng-36)
(DE86-008576; LA-10617-MS) Avail: NTIS HC A03/MF A01

Flexure strength was determined by four-point loading and analyzed using Weibull analysis for selected Los Alamos National Laboratory ceramic materials including an MgO-3 wt % Y2O3 body and alumina bodies AL-13 and AL-18. Fractographic and microstructural characterizations were also performed on the materials. Results of the Weibull analysis conclude that AL-13 has exceptionally high strength reliability, whereas AL-18 and MgO-3 wt% Y2O3 have strength reliabilities comparable to most ceramic materials. Strength data were also compared to data for similar materials from commercial literature. DOE

EFFECTIVE TEARING MODULUS: A MODEL FOR BRITTLE FRACTURE AND TEARING INSTABILITY
B. D. Macdonald Mar. 1986 38 p
(Contract DE-AC12-76SN-00052)
(DE86-008785; KAPL-4190) Avail: NTIS HC A03/MF A01

The objective of this study was to determine a model for the transition regime and upper shelf fracture resistance of low-strength/high-toughness structural steels. The success of the model was measured in two ways: (1) the condition for fracture specimen maximum load, intersection of applied and material effective tearing modulus curves, was satisfied for compact tension data in the transition and upper shelf fracture regimes; (2) maximum load attained by surface-flawed intermediate test vessels (ITV's) was accurately calculated by using the model and associated compact tension data. The fracture model attribute of stress-dependent plastic zone constraint was thought to be primarily responsible for its thickness insensitivity. Metallurgical fracture mode insensitivity of the model in the transition regime was thought to be primarily due to the use of a plastic zone addition to the physical crack size. Calculation of the fracture model parameters (crack driving/resistance forces and their derivatives with respect to the plastic-zone-corrected crack) was enhanced by the availability of and relationship to linear elastic fracture mechanics formulas. Ligament size criteria consistent with the fracture model were determined empirically for the compact tension specimen. Pressure vessel analyses indicated that model accuracy was acceptable provided that the average hoop stress was less than the yield stress. DOE

THE PROSPECTS FOR FINITE ELEMENT ANALYSIS METHODS FOR STRUCTURAL QUALIFICATION
Apr. 1986 15 p Presented at the 61st Meeting of the Structures and Materials Panel of AGARD, Oberammergau, West Germany, 8-13 Sep. 1985
(AGARD-R-736; ISBN92-835-1526-9) Avail: NTIS HC A02/MF A01

As part of its 61st Meeting the AGARD Structures and Materials Panel considered whether or not it should set up an activity to examine the possibilities of Structural Qualification by using Finite Element Analytical Methods in place of testing. As a preliminary to its discussions it heard the two papers printed here. The first of these looks in general terms at the capabilities of existing organisations and systems vis- a-vis the standards which must necessarily be established before FEM qualification procedures can be implemented. The second paper looks in rather more detail at how non-linear FEM may be applied in support of structural tests. Author

Experiments to study how spaceborne imaging radar can improve geological mapping capability and capacity are proposed for the X-SAR/SIR-C mission. Complementary data X-SAR-type imagery can provide at regional to global scales as compared to information from Landsat sensors is discussed. Expected information on rocks, soils, and structures is assessed. Effect of radar operating parameters (illumination geometry, frequency, and polarization) on radar backscatter of rock units and surficial deposits in diverse type of terrain (arid, semi-arid, Mediterranean, humid, tropical areas; plains, rolling country, hilly and mountainous terrain) is considered. Test areas to evaluate the application potential of multifrequency, multipolarization, and multi-incidence-angle imagery for regional and global geological mapping projects are suggested. ESA

GEOPOTENTIAL RESEARCH MISSION, SCIENCE, ENGINEERING AND PROGRAM SUMMARY
Thomas Keating, ed., Patrick Taylor, ed., Werner Kahn, ed., and Francis Lerch, ed. Jul. 1986 209 p
(NASA-TM-86240; Rept-86B0409; NAS 1.15:86240) Avail: NTIS HC A10/MF A01 CSCL 08E

This report is based upon the accumulated scientific and engineering studies pertaining to the Geopotential Research Mission (GRM). The scientific need and justification for the measurement of the Earth's gravity and magnetic fields are discussed. Emphasis is placed upon the studies and conclusions of scientific organizations and NASA advisory groups. The engineering design and investigations performed over the last 4 years are described, and a spacecraft design capable of fulfilling all scientific objectives is presented. In addition, critical features of the scientific requirements and state-of-the-art limitations of spacecraft design, mission flight performance, and data processing are discussed. Author

EARTH OBSERVING SYSTEM. DATA AND INFORMATION SYSTEM. VOLUME 2A: REPORT OF THE EOS DATA PANEL
1986 63 p
(NASA-TM-87777; NAS 1.15:87777) Avail: NTIS HC A04/MF A01 CSCL 05B

The purpose of this report is to provide NASA with a rationale and recommendations for planning, implementing, and operating an Earth Observing System data and information system that can evolve to meet the Earth Observing System's needs in the 1990s. The Earth Observing System (Eos), defined by the Eos Science and Mission Requirements Working Group, consists of a suite of instruments in low Earth orbit acquiring measurements of the Earth's atmosphere, surface, and interior; an information system to support scientific research; and a vigorous program of scientific research, stressing study of global-scale processes that shape and influence the Earth as a system. The Eos data and information system is conceived as a complete research information system that would transcend the traditional mission data system, and include additional capabilties such as maintaining long-term, time-series data bases and providing access by Eos researchers to relevant non-Eos data. The Working Group recommends that the Eos data and information system be initiated now, with existing data, and that the system evolve into one that can meet the intensive research and data needs that will exist when Eos spacecraft are returning data in the 1990s. A COMPARISON OF ADOS (AFRICAN DOPPLER SURVEY) POINT POSITIONING RESULTS FROM VARIOUS SOFTWARES Final Report
Thomas J. Knopp 27 Feb. 1986 16 p Presented at the International Geodetic Symposium on Satellite Positioning, Austin, Tex., 28 Apr. - 2 May 1986
(AD-A166840; AD-E950814) Avail: NTIS HC A02/MF A01 CSCL 08/5

The African Doppler Survey project (ADOS) is a multi-national effort to establish primary control (via Doppler satellite observations) on the African continent. There are four Computing Centers under the ADOS project which use three different point positioning programs. These programs are: DOPL79, GEODOP V, and ORB-SPP. The differences observed in the computations using the various softwares were recently investigated. This paper presents preliminary results of this study. GRA

DISTRIBUTED GEOGRAPHIC MAPPING USING A CENTRALIZED DISSPLA-BASED MAPPING SYSTEM AND AUTOCAD PC SOFTWARE
M. Snider 1986 7 p Presented at the ISSCO Week, New Orleans, La., 10 Mar. 1986
(Contract W-31-109-eng-38)
(DE86-009184; CONF-860363-2) Avail: NTIS HC A02/MF A01

This paper describes procedures devised for transferring mapped information between a DISSPLA-based geographic

mapping system on a centralized computer and an AUTOCAD system on a PC. The centralized mapping system is used as a repository for the large map data bases and to provide capabilities for drawing maps on various output devices including graphics terminals. The map data from any map drawn on the centralized system can be down-loaded to the PC. AUTOCAD is then used to view and edit the map and to add information. Final maps can be drawn using the AUTOCAD software or the AUTOCAD files can be sent to the centralized system to be included in the central data bases. These procedures allow us to take advantage of DISSPLA software, data management facilities, and graphical analytic functions available on the central system, while using the more interactive features available in AUTOCAD for viewing, entering, and editing the data. PHASE A TECHNICAL STUDY SUMMARY REPORT FOR A TROPICAL EARTH RESOURCES SATELLITE (TERS)
1984 116 p Prepared in cooperation with National Aerospace Lab., Amsterdam, Netherlands, Signaal, Utrecht State Univ., Netherlands, and Technische Physische Dienst TNO-TH, Delft, Netherlands
(JTERS-84-07; ESA-86-97496) Avail: NTIS HC A06/MF A01

The high (1681 km) equatorial orbit of the Tropical Earth Resources Satellite with its particle radiation hazards (as compared to an alternative low near equatorial orbit with operational complications) was studied. Selective viewing by cloud sensor and cross track instrument pointing was analyzed. The consequences of the high spectral resolution (20 m color, 10 m panchromatic) for the designs of instrument, satellite systems, data handling, and ground data processing were assessed. Ground observations at different solar illumination angles and view angles were simulated. A satellite configuration concept was defined. The concept seems feasible, although it is technologically challenging. Radiation aspects require a careful development and may influence the design of instrument and spacecraft systems. ESA

N86-31098# Royal Netherlands Aircraft Factories Fokker, Amsterdam.
PROPOSAL TO NIVR FOR A SYSTEM DEFINITION STUDY OF A TROPICAL EARTH RESOURCES SATELLITE (TERS)
1984 158 p Prepared in cooperation with National Aerospace Lab., Amsterdam, Netherlands, Signaal, Utrecht State Univ., Netherlands, and Technische Physische Dienst TNO-TH, Delft, Netherlands
(NTERS-84-11; ESA-86-97497) Avail: NTIS HC A08/MF A01

A study to provide a technical definition of the Tropical Earth Resources Satellite (TERS) spacecraft, ground station, data preprocessing facilities and satellite operations in sufficient detail for a reliable estimate of the required budget and time for the realization of a TERS project is proposed. It should also provide a better insight into the feasibility aspects of such a project. The technical definition includes system and subsystem design specifications, and definition of the products to be supplied to the users. The execution of the project is defined up to and including the in-orbit checkout. ESA

ELECTROLYTE FOR USE IN HIGH ENERGY LITHIUM BASED RECHARGEABLE ELECTROCHEMICAL CELL AND RECHARGEABLE ELECTROCHEMICAL CELL INCLUDING THE ELECTROLYTE Patent Application
Robert J. Mammone and Michael Binder, inventors (to Army) Filed 17 Apr. 1986 12 p
(AD-D012310; US-Patent-Appl-SN-855855) Avail: NTIS HC A02/MF A01 CSCL 03B

The general object of this invention is to provide a lithium based rechargeable electrochemical cell having an improved capacity. A more specific object of the invention is to provide an electrolyte for such a cell. A still further object of the invention is to provide such a cell. A still further object of the invention is to provide such a rechargeable electrochemical cell that permits the oxidation of dithionite to occur without using chlorine as an intermediate oxidizing agent. It has now been found that the aforementioned objects can be attained by providing an electrolyte including bromine dissolved in the liquid complex Li(s02)3A1C14. GRA

SYSTEM PERFORMANCE ANALYSIS OF STRETCHED MEMBRANE HELIOSTATS
J. V. Anderson, L. M. Murphy, W. Short, and T. Wendelin Dec. 1985 8 p Presented at the ASME Solar Energy Division Conference, Anaheim, Calif., 14 Apr. 1986
(Contract DE-AC02-83CH-10093)
(DE85-016885; SERI/TP-253-2819; CONF-860406-5) Avail: NTIS HC A02/MF A01

The optical performance of both focused and unfocused stretched membrane heliostats was examined in the context of the overall cost and performance of central receiver systems. The sensitivity of optical performance to variations in design

parameters such as the system size (capacity), delivery temperature, heliostat size, and heliostat surface quality was also examined. The results support the conclusion that focused stretched membrane systems provide an economically attractive alternative to current glass/metal heliostats over essentially the entire range of design parameters studied. In addition, unfocused stretched membrane heliostats may be attractive for a somewhat more limited range of applications, which would include the larger plant sizes (e.g., 450 MW) and lower delivery temperatures (e.g., 450(0)C), or situations in which the heliostat size could economically be reduced. DOE

TECHNICAL AND ECONOMIC ASSESSMENTS OF ELECTROCHEMICAL ENERGY STORAGE SYSTEMS. VOLUME 1: EXECUTIVE SUMMARY Final Report, Sep. 1978 - May 1985
J. L. DelMonaco, M. P. Chavaraju, and A. W. Quade 1 Aug. 1985 63 p
(Contract DE-AC02-78ET-26950)
(DE86-006855; DOE/ET-26950/1-Vol-1) Avail: NTIS HC A04/MF A01

Results show that it is technically feasible to use the four types of batteries (ZnCl2, Na2S, ZnBr2 and Pb/acid) as load-leveling energy storage devices. In terms of short circuit impact, stability and reliability, no adverse problems were uncovered. Economic benefits of using batteries for load-leveling are marginal. Preliminary assessment of possible cost reductions in battery cost estimates show that batteries can be economical for some load-leveling applications. The relationship of battery breakeven cost vs battery system cost projections indicates that some types of battery systems would be economical for peaking duty, compared with combustion turbines (CT's). Since one of the battery systems studied had the lowest estimated installed cost and the highest breakeven cost, it would justify up to a 3% penetration. Initial estimates indicate that several battery systems are clearly not competitive with CT's, or only competitive at low penetration levels. Battery breakeven costs decline with increasing battery penetration. However, this trend is in step with the reduced unit costs which will hopefully be achieved with maturing production processes. Potential for cost reduction is estimated at about 25%. DOE

DEVELOPMENT OF AN ELASTIC-IMPULSE POWER TRANSMISSION FOR WIND ENERGY CONVERSION SYSTEMS Final Report
B. Pahl Jan. 1986 43 p
(DE86-900708; NMERDI-2-73-4627) Avail: NTIS HC A03/MF A01

A multiload-capable elastic-impulse power transmission for use in Wind Energy Conversion Systems (WECS) was designed, prototype constructed and bench tested. The transmission interposes a temporary energy storage device between the input and output shafts, and therefore allows the two shafts to rotate at virtually independent speeds. For utility interface induction generators which must run at essentially constant speed, the transmission allows the turbine rotor to run at variable speed, thereby maintaining the constant tip-speed ratio corresponding to the peak-power point. The transmission was found to work in principle, but the first construction prototype exhibited low efficiencies (24%) due to the constraints imposed by the utilization of commercial components. DOE

SPACE POWER USING SOLAR PHOTOVOLTAIC PANELS: COSTS AND LIMITATIONS
Kent A. Williams Mar. 1986 80 p
(Contract DE-AC05-84OR-21400)
(DE86-008953; ORNL/TM-9856) Avail: NTIS HC A05/MF A01

Solar photovoltaic panels (SPPs) have been suggested as a possible prime space power source for multi-kilowatt applications within a ballistic missile defense (BMD) system. As a first step in an attempt to assess the affordability of possible BMD space power sources, the limitations and costs of space power satellites using SSPs in conjunction with an electrochemical energy storage system have been investigated. Both high and low earth orbital missions are considered. An extensive literature search was conducted to determine values for the principal technology-driven performance and cost figures of merit. A small computer code was then developed to evaluate the total power cost, including launch, in dollars per watt of desired space power load. The unit costs obtained were found to be heavily influenced by the nature of the mission (altitude) and the attainable specific power for the two major system components. DOE

(DE86-008518; ANL-86-12) Avail: NTIS HC A03/MF A01

Cycle life of the 15-electrode Advanced-1 design, utilizing the all lead-plastic grids, was increased from less than 150 to 296 cycles (C-420) by using an additive to strengthen the positive active material (PAM). This cell demonstrated a specific energy of 44.6 Wh/kg at the C/3 rate. The utilization of the PAM was increased from 45.2 Ah/1b PAM to 58.4 Ah/1b PAM. The 58.4 Ah/1b value represents an increase of 91% in the utilization as compared to an EV-2300 at the same rate. The flow-through cell operates in an oxygen recombination mode and the cell design controls the efficiency of the recombination. The main failure mode of the cells was the loss of the preferred structure of the PAM, resulting in the cracking and dislodging of pellets. A secondary failure mode is the change of the physical and chemical properties of the negative active material. A new, cell component (diffuser) increased the uniformity of the electrolyte flow through the positive electrode. Die cutting Lexan sheet stock reduced test cell building labor costs by 75%. A 3-electrode screening cell design was develope d which utilizes a gasketing material to seal the assembly. DOE

WIND ENERGY IN ELECTRIC POWER PRODUCTION, PRELIMINARY STUDY
R. Lento and E. Peltola Jan. 1984 134 p In FINNISH
(DE86-751566; VTT-TIED-282) Avail: NTIS (US Sales Only) HC A07/MF A01

The wind speed conditions in Finland have been studied with the aid of the existing statistics of the Finnish Meteorological Institute. With the aid of the statistics estimates on the available wind energy were also made. Eight hundred wind power plants, 1.5 MW each, on the windiest west coast would produce about 2 TWh energy per year. Far more information on the temporal, geographical and vertical distribution of the wind speed than the present statistics included is needed when the available wind energy is estimated, when wind power plants are dimensioned optimally, and when suitable locations are chosen for them. The investment costs of a wind power plant increase when the height of the tower or the diameter of the rotor is increased, but the energy production increases, too. Thus, overdimensioning the wind power plant in view of energy needs or the wind conditions caused extra costs. The cost of energy produced by wind power can not yet compete with conventional energy, but the situation changes to the advantage of wind energy, if the real price of the plants decreases (among other things due to large series production and increasing experience), or if the real price of fuels rises. The inconvinience on the environment caused by the wind power plants is considered insignificant. The noise caused by the plant attenuates rapidly with distance. No harmful effects to birds and other animals caused by the wind power plants have been observed in the studies made abroad. Parts of the plant getting loose during an accident, or ice forming on the blades are estimated to fly even from a large plant only a few hundred meters. DOE

DETERMINATION OF OPTIMUM MOUNTING CONFIGURATIONS FOR FLAT-PLATE PHOTOVOLTAIC MODULES BASED ON A STRUCTURED FIELD EXPERIMENT AND SIMULATED RESULTS FROM PVFORM, A PHOTOVOLTAIC SYSTEM PERFORMANCE MODEL
D. F. Menicucci Jan. 1986 42 p
(Contract DE-AC04-76DP-00789)
(DE86-009539; SAND-85-1251) Avail: NTIS HC A03/MF A01

The performance of a photovoltaic (PV) system is affected by its mounting configuration. The optimal configuration is unclear because of lack of experience and data. Sandia National Laboratories, Albuquerque (SNLA), has conducted a controlled field experiment to compare four types of the most common module mounting. The data from the experiment were used to verify the accuracy of PVFORM, a new computer program that simulates PV performance. PVFORM was then used to simulate the performance of identical PV modules on different mounting configurations at 10 sites throughout the US. This report describes the module mounting configurations, the experimental methods used, the specialized statistical techniques used in the analysis, and the final results of the effort. The module mounting configurations are rank ordered at each site according to their annual and seasonal energy production performance, and each is briefly discussed in terms of its advantages and disadvantages in various applications. DOE

FALLING FILM FLOW CHARACTERISTICS OF THE DIRECT ABSORPTION RECEIVER
T. A. Newell, K. Y. Wang, and R. J. Copeland Mar. 1986 57 p
(Contract DE-AC02-83CH-10093)
(DE86-004432; SERI/TR-252-2641) Avail: NTIS HC A04/MF A01

This report examines the characteristics of a thin, falling film used in a direct absorption receiver, investigates the system performance, and discusses the flow similarities between water and salt. In this receiver concentrated radiation is directly absorbed within a thin layer of molten carbonate salt flowing down near vertical wall. System capacities of 25 to 360 MW/sub t/ were analyzed. The experiments were isothermal; therefore, heat transfer characteristics were determined from film shear stress. A 25 MW/sub t/ receiver at a high turn-down ratio (5:1) marginally violates a film breakdown criterion. At high film flow rates gas and liquid interactions can cause a droplet removal phenomenon. Neither of these should affect film flow stability. Film thickness is also important in predicting operating characteristics. A rough wall surface significantly enhances wall-to-film heat transfer, but the roughness height should not exceed what the film's thickness would be over a smooth surface. In general, a molten carbonate salt film should be stable over the anticipated range of receiver capacities and operating conditions. Only small systems at low flow conditions may be near a critical opration limit. DOE

GROUND BASED OZONE MEASUREMENTS IN AN EQUATORIAL RAINFOREST
Volker W. J. H. Kirchhoff Apr. 1986 30 p Presented at the Spring AGU Meeting, Baltimore, Md., 19-23 May 1986 Sponsored by the Fundo Nacional de Desenvolvimento Cientifico e Tecnologico
(INPE-3858-PRE-922) Avail: NTIS HC A03/MF A01

Ozone concentrations have been measured in Manaus (3 deg. S, 60 deg. W) during NASA's ABLE expedition of July 1985. Diurnal variations of surface ozone were measured using UV surface ozone sensors, and 14 ozonesondes were launched to obtain vertical profiles of ozone in the troposphere and stratosphere. The diurnal variations are rather strong. At night it is not uncommon to obtain zero mixing ratios, diurnal values being around 10-20 ppbv, maximizing around 13 L.T. Tropospheric mixing ratios are much lower than at Natal (6 deg. S, 35 deg. W), and the mixing ratio gradient close to the ground is more than twice as large as at Natal. Author

VOLCANIC IMPACT ON STRATOSPHERIC AEROSOL CHEMISTRY Final Report, Mar. 1980 - Dec. 1983
William H. Zoller 1984 16 p
(Grant NAG2-28)
(NASA-CR-176901; NAS 1.26:176901) Avail: NTIS HC A02/MF A01 CSCL 13B

Samples collected by the National Center for Atmospheric Research (NCAR) using the multiple-filter sampler on the U-2 were analyzed. The sampler is capable of exposing a number of 110 mm filters in sequence to ram air flow. Two types of filters, IPC cellulose and polystrene, were used, both of which have high blank levels for the trace elements determined. The levels of most trace elements in the stratosphere are so low under normal circumstances that none can be seen. Results from the eruption of Mt. St. Helens, a mystery cloud (probably volcanic in origin) in 1982, and the El Chichonal eruption in 1983 are discussed. To improve the collection of particles for chemical analysis, a new sampling system was developed for use on the U-2. The sampler consisted of an electrostatic collection of particles between 1 and 0.001 micron diameter dierectly onto electron microscopic grids, followed by a thermal precipitation for the smaller particles. The system was built and tested in the laboratory, but never flown on the U-2. B.G.

ACID DEPOSITION: A NATIONAL PROBLEM
George R. Hendrey 1985 15 p Presented at the Acid Deposition: Environmental, Economic, and Policy Issues, Plattsburgh, N.Y., 10 Jun. 1983
(Contract DE-AC02-76CH-00016)
(DE86-007810; BNL-36875; CONF-8306288-1) Avail: NTIS HC A02/MF A01

The deposition of excessive quantities of sulfur and nitrogen from the atmosphere constitutes a problem encompassing all of the United States east of the Mississippi River. It also occurs in some areas of the western US. Calculations based on emission inventories and simplifying assumptions indicate electric utilities account for 66% of SO2 emissions, 29% of NO/sub x/ emissions and about half of precipitation acidity. Acidification of clearwater lakes and streams is a widespread problem only in areas receiving rain with an average acidity less than or equal to 4.7. The dominant anion in such waters is SO4(2-) and concentrations of aluminum derived from watershed acidification may exceed 200 (MU)g 1(-1). Changes in assemblages of aquatic biota become increasingly apparent as pH decreases below 6.0, and elimination of fish from some waters has been documented. The sensitivity of surface saters is controlled by and represents an integration of biogeochemical processes in their edaphic settings. Changes in surface water chemistry imply changes in the terrestrial environment. Direct evidence of changes in terrestrial environments is sparse. Nevertheless, observations of forest dieback in the US and abroad suggest that acid deposition may contribute to the problem. Very few credible studies are available which allow an evaluation of acid precipitation effects on crops. DOE

Reconnaissance field work has led to the recognition of extensive Early Tertiary gneiss and schist which are distinguished by weakly developed to highly conspicous northeast to east-trending stretching lineation commonly accompanied by low-dipping foliation. This structural fabric has been imposed on Precambrian to Paleogene rocks. Regionally, minimum ages of deformation are based upon interpreted U-Pb isotopic ages from suites of cogenetic zircon from the Paleogene orthogneiss. Locally, the interpreted ages indicate that ductile deformation continued as late as Oligocene (Anderson and others, 1980; Silver and Anderson, 1984). The consistency of the deformational style is such that, although considerable variation in intensity exists, the fabric can be recognized and correlated in rocks away from the Paleogene orthogneiss. Extensional tectonism, which dominates middle- and late-Tertiary geology in western Arizona, southeastern California, and southern Nevada, is characterized by normal regionally extensive, low-angle detachment faults. The decollement movement of Fupper plate rocks relative to lower plate assemblages created extensive zones of dilatency, including synthetic and antithetic listric normal faults, tear faults, tectonic crush breccias, shatter breccias, and gash veins in lithologic units above and below the detachment. The tectonically enhanced permeability above and below the detachment fault permitted mass migration of large volumes of hydrothermal solutions along the fault zone during and following upper plate movement. Major quantities of MgO, CaO, K2O, FeO/Fe2O3, SiO2 and CO2 were added to rocks in and near the detachment and related structures. Also introduced were varying amounts of trace elements including Mn, Cu, S, Mo, Ba, Au, Pb, Zn, U and/or Ag. Minerals containing fluid inclusions were collected from all of these loci at locations in detachment faulted terranes in western Arizona and southeastern California. Author

HEAT FLOW AND CONTINENTAL BREAKUP: THE GULF OF ELAT (AQABA)

Zvi Ben-Avraham and Richard P. VonHerzen (Woods Hole Oceanographic Institution, Mass.) *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 10-11 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

Heat flow measurements were made in the major basins of the Gulf of Elat (Aqaba), northern Red Sea. The gulf is located at the southern portion of the Dead Sea rift which is a transform plate boundary. Gradient measurements at each site were made with a probe which allows multiple penetration of the bottom during a single deployment of the instrument. Thermal conductivity was determined by needle probe measurements on sedimentary cores. The mean heat flux, about 80 mWm(-2), is significantly above the continental mean, and probably also above that from the adjacent Sinai and Arabian continental blocks. The heat flow appears to increase from north to south. Such an increase may be related to the more advanced rifting stage of the Red Sea immediately to the south, which presently includes creation of an oceanic crust. This trend also corresponds to the general trend of the deep crustal structure in the gulf. Evidence from various geophysical fields suggest a gradual thinning of the crust towards the direction of the Red Sea where a normal oceanic crust exists. The heat flow data, together with other geophysical data, indicate a propagation of mature rifting activity from the Red Sea into the Gulf of Elat. This process is acting simultaneously with the transform motion along the Dead Sea rift. Author

EVOLUTION OF BASIN AND RANGE STRUCTURE IN THE RUBY MOUNTAINS AND VICINITY, NEVADA

D. D. Blackwell, N. M. Reese, and S. A. Kelley *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 12-14 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

Results from various age dating techniques, seismic reflection profiling hydrocarbon maturation studies, and structural analysis were used to evaluate the Cenozoic deformation in the Ruby Mountains and adjoining ranges (pinyon Range and Cortez Range) in Elko and Eureka Counties, Nevada. Age dating techniques used include potassium-argon ages of biotites from granites published by Kistler et al. (1981) and fission track ages from apatite and zircon. Fission track ages from apatite reflect a closing temperature of 100 plus or minus 20 deg C. Zircon fission track ages reflect a closing temperature of 175 plus or minus 25 deg C and potassium-argon ages from brotite reflect a closing temperature of 250 plus or minus 30 deg C. Thus these results allow a reasonably precise

tracking of the evolution of the ranges during the Cenozoic. Seismic reflection data are available from Huntington Valley. Access to seismic reflection data directly to the west of the Harrison Pass Pluton in the central Ruby Mountains was obtained. In addition results are available from several deep exploration holes in Huntington Valley. Author

LATE CRETACEOUS EXTENSIONAL TECTONICS AND ASSOCIATED IGNEOUS ACTIVITY ON THE NORTHERN MARGIN OF THE GULF OF MEXICO BASIN

R. L. Bowen and D. A. Sundeen *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 15-17 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

Major, dominantly compressional, orogenic episodes (Taconic, Acadian, Alleghenian) affected eastern North America during the Paleozoic. During the Mesozoic, in contrast, this same region was principally affected by epeirogenic and extensional tectonism; one episode of comparatively more intense tectonic activity involving extensive faulting, uplift, sedimentation, intrusion and effusion produced the Newark Series of eposits and fault block phenomena. This event, termed the Palisades Disturbance, took place during the Late Triassic - Earliest Jurassic. The authors document a comparable extensional tectonic-igneous event occurring during the Late Cretaceous (Early Gulfian; Cenomanian-Santonian) along the southern margin of the cratonic platform from Arkansas to Georgia. A REGIONAL 17-18 MA THERMAL EVENT IN SOUTHWESTERN ARIZONA

William E. Brooks *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 18-21 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

A regional thermal event in southwestern Arizona 17 to 18 Ma ago is suggested by discordances between fission track (FT) and K-Ar dates in Tertiary volcanic and sedimentary rocks, by the abundance of primary hydrothermal orthoclase in quenched volcanic rocks, and by the concentration of Mn, Ba, Cu, Ag, and Au deposits near detachment faults. A high condont alteration index (CAI) of 3 to 7 is found in Paleozoic rocks of southwestern Arizona. The high CAI may have been caused by this mid-Tertiary thermal event. Resetting of temperature-sensitive TF dates (2) 17 to 18 Ma with respect to K-Ar dates of 24 and 20 Ma has occurred in upper plate volcanic rocks at the Harcuvar and Picacho Peak detachments. Discordances between FT and K-Ar dates are most pronounced at detachment faults. However, on a regional scale Ft dates from volcanic and sedimentary rocks approach 17 to 18 Ma event in areas away from known detachment faults. Effects of detachment faulting on the K-Ar system suggest that dates of correlative rocks will be younger as the detachment fault is approached. Author

GEOMETRIC AND CHRONOLOGIC EVOLUTION OF THE VERDE AND PAYSON BASINS OF CENTRAL ARIZONA AND POSSIBLE RELATIONSHIPS TO DETACHMENT FAULTING

D. S. Brumbaugh *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 22-24 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

The Transition Zone of Arizona and the structural basins therein have been poorly understood features from a structural standpoint. This is true both of their overall geometry as well as their formation. Yet these basins have developed within the last 13 million years and thus represent perhaps the most recent phase of development related to the extensional tectonics of the Basin and Range province. Recent work (Smith, 1984; Vance, 1983) as well as some older studies (Anderson and Creasy, 1985; Pedersen and Royce, 1970) provide data on the geometry of the Verde and Payson basins which can be used to constrain some hypotheses related to the development of these basins. The work of Cloos (1868), Anderson et. al. (1983), Wernicke and Burchfiel (1982) and Davis et. al. (1980) suggest a spatial and chronologic relation exists between planar high angle normal faults and low angle detachment faults. Perhaps one of the clearest examples from the Basin and Range area appears to be from seismic reflection profiles of the Sevier Desert Basin area of Utah (Fig. 1). These profiles suggest the existence fault-controlled extension basin development above it. Faults that appear either listric or planar intersect it from above. Author

POTASSIUM METASOMATISM OF VOLCANIC AND SEDIMENTARY ROCKS IN RIFT BASINS, CALDERAS AND DETACHMENT TERRANES

C. E. Chapin and J. I. Lindley (North Carolina Univ., Chapel Hill.) *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 25-31 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

The chemical, mineralogical, and oxygen-isotopic changes accompanying K-metasomatism are described. The similarities with diagenetic reactions in both deep marine and alkaline, saline-lake environments are noted. The common occurrence of K-metasomatism in upper-plate rocks of detachment terranes indicates that the early stage of severe regional extension causes crustal downwarping and, in arid to semi-arid regions, development of closed hydrographic basins. EXTENSIONAL TECTONICS AND COLLAPSE STRUCTURES IN THE SUEZ RIFT (EGYPT)

P. Y. Chenet, B. Colletta, G. Desforges (Gameat Dowal Arabia, Cairo (Egypt).), E. Ousset, and E. A. Zaghloul *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 32-33 (For primary document see N86-31119 22-46)

Avail NTIS HC A08/MF A01 CSCL 08G

The Suez Rift is a 300 km long and 50 to 80 km wide basin which cuts a granitic and metamorphic shield of Precambrian age, covered by sediments of Paleozoic to Paleogene age. The rift structure is dominated by tilted blocks bounded by NW-SE normal faults. The reconstruction of the paleostresses indicates a N 050 extension during the whole stage of rifting. Rifting began 24 My ago with dikes intrusions; main faulting and subsidence occurred during Early Miocene producing a 80 km wide basin (Clysmic Gulf). During Pliocene and Quaternary times, faulting is still active but subsidence is restricted to a narrower area (Present Gulf). On the Eastern margin of the gulf, two sets of fault trends are predominant: (1) N 140 to 150 E faults parallel to the gulf trend with pure dip-slip displacement; and (2) cross faults, oriented NOO to N 30 E that have a strike-slip component consistent with the N 050 E distensive stress regime. The mean dip cross fault is steeper (70 to 80 deg) than the dip of the faults parallel to the Gulf (30 to 70 deg). These two sets of fault define diamond shaped tilted block. The difference of mechanical behavior between the basement rocks and the overlying sedimentary cover caused structural disharmony and distinct fault geometries. Author

TECTONIC DETERMINATIONS OF LITHOSPHERIC THICKNESS ON GANYMEDE AND CALLISTO c91

Steven K. Croft *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 34-37 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

The concept of the Maxwell time of a viscoelastic material (4.5) is used in conjunction with calculated thermal profiles to evaluate the significance of tectonic estimates of lithospheric thickness. Thermal lithospheric thicknesses provide fundamental constraints on planetary thermal histories that complement the constraints provided by dateable surface deposits of endogenic origin. Lithospheric constraints are of particular value on the icy satellites where our understanding of both rheology and surface ages is considerably poorer than it is for the terrestrial planets. Certain extensional tectonic features can and have been used to estimate lithospheric thicknesses on Ganymede and Callisto. These estimates, however, refer to the depth of the elastic lithosphere defined by the zone of brittle failure. The relation between the elastic lithosphere and the thermal lithosphere (generally defined by the zone of conductive heat transport) is not straightforward, because the depth of brittle failure depends not only on the thermal profile, but also on rheology and strain rate (or the characteristic time over which stresses build towards failure). Characteristic time considerations are not trivial in this context because stresses generating brittle failure on the icy satellites may be produced by impacts, with characteristic times of seconds to days, or by geologic processes with time scales of hundreds of millions of years. METAMORPHIC CORE COMPLEXES: EXPRESSION OF CRUSTAL EXTENSION BY DUCTILE-BRITTLE SHEARING OF THE GEOLOGIC COLUMN

G. H. Davis *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 38-39 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

Metamorphic core complexes and detachment fault terranes in the American Southwest are products of stretching of continental crust in the Tertiary. The physical and geometric properties of the structures, fault rocks, and contact relationships that developed as a consequence of the extension are especially well displayed in southeastern Arizona. The structures and fault rocks, as a system, reflect a ductile-through-brittle continuum of deformation, with individual structures and faults rocks showing remarkably coordinated strain and displacement patterns. Careful mapping and analysis of the structural system has led to the realization that strain and displacement were partitioned across a host of structures, through a spectrum of scales, in rocks of progressively changing rheology. By integrating observations made in different parts of the extensional system, especially at different inferred depth levels, it has been possible to construct a descriptive/kinematic model of the progressive deformation that achieved continental crustal extension in general, and the development of metamorphic core complexes in particular. THERMAL HISTORY OF A METAMORPHIC CORE COMPLEX

Roy K. Dokka, Michael J. Mahaffie, and Arthur W. Snoke (Wyoming Univ., Laramie.) *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 40-41 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

Fission track (FT) thermochronology studies of lower plate rocks of the Ruby Mountains-East Humbolt Range metamorphic core complex provide important constraints on the timing an nature of major middle Tertiary extension of northeast Nevada. Rocks analyzed include several varieties of mylonitic orthogneiss as well as amphibolitic orthognesses from the non-mylonitic infrastructural core. Oligocene-age porphyritic biotite granodiorite of the Harrison Pass pluton was also studied. The minerals dated include apatite, zircon, and sphene and were obtained from the same rocks that have been previously studied. FT ages are concordant and range in age from 26.4 Ma to 23.8 Ma, with all showing overlap at 1 sigma between 25.4 to 23.4 Ma. Concordancy of all FT ages from all structural levels indicates that the lower plate cooled rapidly from temperatures above approx. 285 C (assumed sphene closure temperature (2)) to below approx. 150 C (assumed apatite closure temperature) near the beginning of the Miocene. This suggests that the lower plate cooled at a rate of at least approx. 36 deg C/Ma during this event. Rapid cooling of the region is considered to reflect large-scale tectonic denudation (intracrustal thinning), the vertical complement to intense crustal extension. FT data firmly establish the upper limit on the timing of mylonitization during detachment faulting and also coincide with the age of extensive landscape disruption. Author

THERMAL-MECHANICAL RESPONSE TO SIMPLE SHEAR EXTENSION

K. P. Furlong *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 42-44 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

The mechanism of extension in the continental crust is apparently much more complex than that acting in the oceanic lithosphere. Recently, Wernicke has proposed that a significant fraction of extension in the continental lithosphere may occur by a simple shear mechanism along discrete fault/shear zones which cut the crust, and perhaps extend into the uppermost mantle. Clearly much of the surface evidence for extension supports this concept, but the depth extent of simple shear extension in the continental crust is unclear. Using numerical simulations, the thermal and associated mechanical behavior of the continental lithosphere in response to lithosphere extension along a low-angle simple shear zone which cuts through the lithospheric plate was determined in order to evaluate the resolving ability of thermal (heat flow and metamorphic P-T-time paths) and elevation observations in constraining the mode of continental extension. LITHOSPHERIC STRENGTH OF GANYMEDE: CLUES TO EARLY THERMAL PROFILES FROM EXTENSIONAL TECTONIC FEATURES **c91**

M. P. Golombek and W. B. Banerdt *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 45-49 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

While it is generally agreed that the strength of a planet's lithosphere is controlled by a combination of brittle sliding and ductile flow laws, predicting the geometry and initial characteristics of faults due to failure from stresses imposed on the lithospheric strength envelope has not been thoroughly explored. Researchers used lithospheric strength envelopes to analyze the extensional features found on Ganymede. This application provides a quantitative means of estimating early thermal profiles on Ganymede, thereby constraining its early thermal evolution. Author

IO: MOUNTAINS AND CRUSTAL EXTENSION

M. J. Heath *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 50-54 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

It is argued that there is good reason to conclude that mountains on Io, like those on Earth, are subject to growth and decay. The decay of mountains will be assisted by the ability of SO sub 2 to rot silicate rock and by explosive escape of sub-surface SO sub 2 from aquifers (Haemus Mons is seen to be covered by bright material, presumably fallout from a SO sub 2 rich plume

which had been active on the mountain flanks). On the west side of the massif at 10 degrees S, 270 degrees W a rugged surface consists of long ridges running perpendicular to the downslope direction, suggesting tectonic denudation with crustal blocks sliding down the mountain flank. Tectonic denudation may be assisted, as in the case of the Bearpaw Mountains, Montana by overloading mountain flanks with volcanic products. The surfaces of some massifs exhibit a well developed, enigmatic corrugated terrain, consisting of complex ridge systems. Ridges may bifurcate, anastomose to form closed depressions and form concentric loops. Taken together, observations of morphology, heat flux, surface deposits and styles of volcanism may point to the existence of lithosphere domains with distinct compositions and tectonic regimes. PN VELOCITY BENEATH WESTERN NEW MEXICO AND EASTERN ARIZONA

Lawrence H. Jaksha *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 55-57 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

The experiment involved observing Pn arrivals on an areal array of 7 seismic stations located in the transition zone and along the Jemez lineament. Explosions in coal and copper mines in New Mexico and Arizona were used as energy sources as well as military detonations at White Sands Missile Range, New Mexico, Yuma, Arizona, and the Nevada Test Site. Very preliminary results suggest a Pn velocity of 7.94 km/s (with a fairly large uncertainty) beneath the study area. The Pn delay times, which can be converted to estimates of crustal thickness given knowledge of the velocity structure of the crust increase both to the north and east of Springerville, Arizona. As a constraint on the velocity of Pn, researchers analyzed the reversed refraction line GNOME-HARDHAT which passes through Springerville oriented NW to SE. This analysis resulted in a Pn velocity of 7.9-8.0 km/s for the transition zone. These preliminary results suggest that a normal Pn velocity might persist even though the crust thins (from north to south) by 15 km along the length of the Arizona-New Mexico border. If the upper mantle is currently hot anywhere in western New Mexico or eastern Arizona then the dimensions of the heat source (or sources) might be small compared to the intra-station distances of the seismic arrays used to estimate the velocity of Pn. BRITTLE EXTENSION OF THE CONTINENTAL CRUST ALONG A ROOTED SYSTEM OF LOW-ANGLE NORMAL FAULTS: COLORADO RIVER EXTENSIONAL CORRIDOR

Barbara E. John and Keith A. Howard *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 58 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

A transect across the 100 km wide Colorado River extensional corridor of mid-Tertiary age shows that the upper 10 to 15 km of crystalline crust extended along an imbricate system of brittle low-angle normal faults. The faults cut gently down a section in the NE-direction of tectonic transport from a headwall breakaway in the Old Woman Mountains, California. Successively higher allochthons above a basal detachment fault are futher displaced from the headwall, some as much as tens of kilometers. Allochthonous blocks are tilted toward the headwall as evidenced by the dip of the cappoing Tertiary strata and originally horizontal Proterozoic diabase sheets. On the down-dip side of the corridor in Arizona, the faults root under the unbroken Hualapai Mountains and the Colorado Plateau. Slip on faults at all exposed levels of the crust was unidirectional. Brittle thinning above these faults affected the entire upper crust, and wholly removed it locally along the central corridor or core complex region. Isostatic uplift exposed metamorphic core complexes in the domed footwall. These data support a model that the crust in California moved out from under Arizona along an asymmetric, rooted normal-slip shear system. Ductile deformation must have accompanied mid-Tertiary crustal extension at deeper structural levels in Arizona. Author

THERMOMECHANICAL MODELING OF THE COLORADO PLATEAU-BASIN AND RANGE TRANSITION ZONE

Michael D. Londe *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 59-63 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

The Colorado Plateau (CP) basin and range (B & R) boundary is marked by a transition zone on the order of 75 to 150 km in width. As one moves westward across this transition from the CP interior to the B & R there is a variation in the surface topography, surface heat flow, Bouguer gravity, seismicity, and crustal structure. This transition extends eastward into the western CP from the Wastach-Hurricane fault line and is largely coincident with the high plateaus of Utah and the Wasatch Mountains. It has been suggested that this transition zone marks a thermal and tectonic encroachment of the CP by the B & R. A simple two dimensional numerical model of the thermal regime for the transition zone was constructed to test the hypothesis that the observed geophysical signatures across the transition are due to lateral heat conduction from steady state uniform extension within the B & R lithosphere. Surface heat flow, uplift due to flexure from thermal buoyant loading, and regional Bouguer gravity are computed for various extension rates, crustal structures, and compensation depths. Author

HEAT AND DETACHMENT IN CORE-COMPLEX EXTENSION

Ivo Lucchitta *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 64-68 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

It is proposed here that the Miocene to Recent structural and volcanic features of the Basin and Range Province can be explained by a single thermotectonic process acting through time. This process consists of a thermal pulse resulting in a high-temperature regime that includes a steep thermal front moving first up toward the topographic surface, then down owing to cooling induced by a combination of convection and conduction. Within the front is a condition defining a critical surface that separates brittle from ductile behavior, and is marked by a nearly horizonal detachment fault. The most prominent and structurally highest position of the detachment results from interaction between the critical surface and a hydrothermal system near the topographic surface. These various features can be superposed on older ones through thermal remobilization or structural reactivation. Author

HEAT FLOW INCREASE FOLLOWING THE RISE OF MANTLE ISOTHERMS AND CRUSTAL THINNING

Jean-Claude Mareschal and George Bergantz *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension and Continents and Planets 1985 p 69-70 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

Heat flow measurements in the western United States define a zone of high heat flow which coincides with the Basin and Range Province where extension has taken place recently. In this region, the average reduced heat flow is approx 30 mW sq. meters higher than in stable continental provinces; locally (e.g. Battle Mountain High), the heat flow anomaly can be more than 100 mW/sq meters above average. Estimates of the amount of extension range between 30% and 100% for the past 30 Ma. In the Colorado Plateau, which has been uplifted without major

tectonic deformation, the heat flow is only slightly above average. Analytical calculations show that an abrupt change in heat flow at the base of the lithosphere 30 Ma ago would not affect the surface significantly. Uplift would proceed at a slow rate. A thermal perturbation at the base of a 40 km thick crust, however, would reach the surface faster and, after 30 Ma, the increase in surface heat flow would be about 75% of the amplitude of the heat flow anomaly. The number of volcanic rocks in the Basin and Range suggests that magma intrusions may provide an effective heat transfer mechanism. It can be show that if the source of the intrusions is at the base of the lithosphere, the response time will be much longer than 30 Ma, and most ot the heat transferred from the asthenosphere will be absorbed in the lithosphere.

RELATIONS BETWEEN EXTENSIONAL TECTONICS AND MAGMATISM WITHIN THE SOUTHERN OKLAHOMA AULACOGEN
D. A. McConnell and M. C. Gilbert *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 71-75 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

Variations in the geometry, distribution and thickness of Cambrian igneous and sedimentary units within southwest Oklahoma are related to a late Proterozoic - early Paleozoic rifting event which formed the Southern Oklahoma aulacogen. These rock units are exposed in the Wichita Mountains, southwest Olkahoma, located on the northern margin of a Proterozoic basin. identified in the subsurface by COCORP reflection data. Overprinting of the Cambrian extensional event by Pennsylvanian tectonism obsured the influence of pre-existing basement structures and contrasting basement lithologies upon the initial development of the aulacogen.

HOT-SPOT TECTONICS ON IO **c91**
Alfred S. McEwen *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 76-80 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

The thesis is that extensional tectonics and low-angle detachment faults probably occur on Io in association with the hot spots. These processes may occur on a much shorter timescale on Ion than on Earth, so that Io could be a natural laboratory for the study of thermotectonics. Furthermore, studies of heat and detachment in crustal extension on Earth and the other terresrial planets (especially Venus and Mars) may provide analogs to processes on Io. The geology of Io is dominated by volcanism and hot spots, most likely the result of tidal heating. Hot spots cover 1 to 2% of Io's surface, radiating at temperatures typically from 200 to 400 K, and occasionally up to 700K. Heat loss from the largest hot spots on Io, such as Loki Patera, is about 300 times the heat loss from Yellowstone, so a tremendous quantity of energy is available for volcanic and tectonic work. Active volcanism on Io results in a resurfacing rate as high as 10 cm per year, yet many structural features are apparent on the surface. Therefore, the tectonics must be highly active.

THE HEART MOUNTAIN FAULT: IMPLICATIONS FOR THE DYNAMICS OF DECOLLEMENT
H. J. Melosh *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 81-84 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

The Hart Mountain docollement in Northwestern Wyoming originally comprised a plate of rock up to 750m thick and 1300 sq kilometers in area. This plate moved rapidly down a slope no steeper than 2 deg. during Early Eocene time, transporting some blocks at least 50m from their original positions. Sliding occurred just before a volcanic erruption and was probably accompanied by seismic events. The initial movement was along a bedding plane fault in the Bighorn Dolomite, 2 to 3 meters above its contact with the Grove Creek member of the Snowy Range formation. The major pecularity of this fault is that it lies in the strong, cliff-forming Bighorn Dolomite, rather than in the weaker underlying shales. The dynamics of decollement are discussed.

OCEANIC STRUCTURES OF THE EARTH AND THE NORTH DEPRESSION OF MARS: A COMPARISON OF THE FORMATION MECHANISMS
E. E. Milanovsky and A. M. Nikishin *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 85-88 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

The system of contemporary oceans on Earth and the North Depression of Mars are quasi-symmetrical in reference to the centers of of the hemispheres. Both systems had been formed over the common megacycle of evolution of planets and their origin is likely to have similar features. The formation of the Earth's oceanic system within the South Hemisphere seems to have proceeded in three stages: (1) the formation of a network of passive rifts at the center of the Gondwana; (2) the formation of the system of active rifts at the zones of forthcoming spreading; and (3) the spreading of the oceanic crust. The formation of the Mar's North Depression seems to have proceeded in two stages: (1) a formation of a dense network of grabens and faults at the center of the North Hemisphere over the upper mantle zone characterized by an anomalous warm-up and a density decrease; and (2) a collapse of the ancient crust and it's overflowing by basalts. The first stage of the ocean formation on Earth and Mars is similar. But there seems to have been a thinner lithosphere on Mars. The dense areal rifting was immediately followed by a total collapse.

THE EVOLUTION OF RIFTING PROCESS IN THE TECTONIC HISTORY OF THE EARTH
E. E. Milanovsky and A. M. Nikishin *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 89-90 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

The continental rifting is the response of the lithosphere to the oriented tension. The distribution of viscosity in the lithosphere plays an essential role during all stages of the rifting. The viscosity is a function of the temperature, the lithostatic pressure, the rock composition, the deformation rate and other factors. The temperature is the most important factor. The vertical section of continental lithosphere of the rift zone may be divided into the following layers: the upper crust, in which brittle deformation prevails; the medial-crust, in which the role of plastic deformation increases; the lower crust, in which plastic deformation prevails; and the uppermost plastic part of the mantle overlapping asthenosphere. The depth of the boundaries in the crust layers are mainly controlled by the temperature.

The saturnian satellites were imaged by the Voyager spacecraft at sufficient resolutions to reveal landforms that indicate histories of extensional tectonics for several of these bodies. The re-

lationships among landforms on various satellites imply that extensional tectonism is a consequence of several different energy sources. Case histories of several satellites are discussed to illustrate the interaction of various phenomena associated with extensional tectonism. Author

LITHOSPHERIC AND CRUSTAL THINNING
I. Moretti *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 93-96 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

In rift zones, both the crust and the lithosphere get thinner. The amplitude and the mechanism of these two thinning situations are different. The lithospheric thinning is a thermal phenomenon produced by an asthenospherical uprising under the rift zone. In some regions its amplitude can exceed 200%. This is observed under the Baikal rift where the crust is directly underlaid by the mantellic asthenosphere. The presence of hot material under rift zones induces a large negative gravity anomaly. A low seismic velocity zone linked to this thermal anomaly is also observed. During the rifting, the magmatic chambers get progressively closer from the ground surface. Simultaneously, the Moho reflector is found at shallow depth under rift zones. This crustal thinning does not exceed 50%. Tectonic stresses and vertical movements result from the two competing effects of the lithospheric and crustal thinning. On the one hand, the deep thermal anomaly induces a large doming and is associated with extensive deviatoric stresses. On the other hand, the crustal thinning involves the formation of a central valley. This subsidence is increased by the sediment loading. The purpose here is to quantify these two phenomena in order to explain the morphological and thermal evolution of rift zones. Author

THERMAL CONTROL OF THE STYLE OF EXTENSIONAL TECTONICS
Paul Morgan *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 97-98 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

Crustal extension is accommodated by a wide range of structural styles ranging from high-angle normal faults to low-angle detachments. In some areas different structural styles are superposed by multiple extension events, and in other areas different structural styles are juxtaposed. As shown with examples from the Rio Grande rift and the Red Sea-Gulf of Aden rift system, high strains and low-angle faulting are commonly spatially and temporally associated with a hot and probably thin lithosphere as indicated by major magmatic activity. Theoretical studies of strength profiles in the lithosphere suggest that there may effectively be a critical range for the geotherm above which low-angle faulting and crustal decollement may be favored over high-angle faulting. Intracontinental zones of extensional tectonic style are commonly of finite width and length. Associated sedimentary troughs are fault-controlled. The evolution of those structures is accompanied by volcanic activity of variable intensity. The characteristic surface structures are usually underlaid by a lower crust of the transitional type while deeper subcustal areas show delayed travel times of seismic waves especially at young tectonic provinces. A correspondence between deep-seated processes and zones of continental extension appears obvious. A sequential order of mechanisms and their importance are discussed in the light of modern data compilations and quantitative kinematic and dynamic approaches. The Cenozoic exensional tectonics related with the Rhine River are discussed. Author

ON THE DIFFERENCES IN CONTINENTAL RIFTING AT THE EARTH, MARS AND VENUS
A. M. Nikishin and E. E. Milanovsky *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 101 - 103 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

During the process of continental rifting on Earth, the lower ductile crust stretches, forming a neck, while the upper brittle crust is broken in blocks by faults, and the blocks sink down the thinned lower crust; if the stretching continues, the neck may break and a newly originated oceanic crust is formed at this place. The rift system structure depends on the depth of the boundary surface between the brittle crust and the ductile crust, the litospheric thickness, the tension value, etc.. The rigid brittle rifting when narrow necks form in the lower crust is characteristic of the contemporary Earth; on Mars the brittle rifting with large subsidence was characteristic of the Tharsis upland formation epoch. The ductile rifting is typical of the Venus. The differences in rheologic features of the lithospheres of different planets causes the variation in types of rifting. Author

HEAT AND EXTENSION AT MID- AND LOWER CRUSTAL LEVELS OF THE RIO GRANDE RIFT
Kenneth H. Olsen, W. Scott Baldridge, and Jonathan F. Callender (New Mexico Univ., Albuquerque.) *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 104 - 105 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

The process by which large amounts (50 to 200 percent) of crustal extension are produced was concisely described by W. Hamilton in 1982 and 1983. More recently, England, Sawyer, P. Morgan and others have moved toward quantifying models of lithospheric thinning by incorporating laboratory and theoretical data on rock rheology as a function of composition, temperature, and strain rate. Hamilton's description identifies three main crustal layers, each with a distinctive mechanical behavior; brittle fracturing and rotation in the upper crust, discontinuous ductile flow in the middle crust and laminar ductile flow in the lower crust. The temperature and composition dependent brittle-ductile transition essentially defines the diffuse boundary between upper and middle crust. It was concluded that the heat responsible for the highly ductile nature of the lower crust and the lensoidal and magma body structures at mid-crustal depths in the rift was infused into the crust by relatively modest (< 10 percent by mass) magmatic upwelling (feeder dikes) from Moho levels. Seismic velocity-versus-depth data, supported by gravity modeling and the fact that volumes of rift related volcanics are relatively modest (< 6000 cubic km) for the Rio Grande system, all imply velocities and densities too small to be consistent with a massive, composite, mafic intrusion in the lower crust. Tectonic extension within continental crust creates a variety of major features best classed as extensional orogens. These features have come under increasing attention in recent years, with the welding of field observation and theoretical concepts. Most recent advances have come from the Basin and Range Province of the southwestern United States and from the North Sea. Application of these geometric and isostatic concepts, in combination with seismic interpretation, to the southern Gulf of Suez, an active extensional orogen, allows generation of detailed structural maps and geometrically balanced sections which suggest a regional structural model. Geometric models which should prove to be a valuable adjunct to numerical and thermal models for the rifting process are discussed. Author

THE RELATIONSHIP OF EXTENSIONAL AND COMPRESSIONAL TECTONICS TO A PRECAMBRIAN FRACTURE SYSTEM IN THE EASTERN OVERTHRUST BELT, USA
Howard Pohn *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 111 - 112 (For primary document see N86-31119 22-46)

The central and southern Appalachians have a long history of interrelated extensional and compressional tectonics. It is proposed that each episode was controlled by a reactivation of a fracture system in the Precambrian basement. Proprietary seismic-reflection profiles show a system of down-to-the-east Precambrian extensional faults. When under renewed extension, these faults produce features such as the western border faults of Mesozoic basins, and when under compression, probably produce tectonic ramps in the overlying sedimentary cover rocks as well as the spatially and genetically related Alleghenian folds. This system, which parallels the Appalachian trend, is cut by a system of cross-strike hinge or scissors faults that have probable strike-slip movements. Reactivation of this cross-strike system appears to have produced lateral ramps that connect decollements at different stratigraphic levels and caused abrupt changes in fold wavelength along strikes. Continued reactivation of this cross-strike system is suggested by east-west border faults and Precambrian highs between Mesozoic basins. The present activity of this system is suggested by the fact that more than 35% of recent earthquakes are coincident with cross-strike faults and lateral ramps. Author

LOW-ANGLE NORMAL FAULTS-LOW DIFFERENTIAL STRESS AT MID CRUSTAL LEVELS
W. L. Power *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 113 - 114 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

A simple model for frictional slip on pre-existing faults that considers the local stress state near the fault and the effect of non-hydrostatic fluid pressures predicts that low-angle normal faulting is restricted to areas of the crust characterized by low differential stress and nearly lithostatic fluid pressures. The model considers frictional slip on a cohesionless low-angle normal fault governed by the failure criterion tau = mu sub f (sigma (*) sub n) =mu sub f (sigma sub n - P sub f) where tau and sigma sub n are the shear and normal stresses across the fault plane, mu sub f is the static coefficient of friction, and P sub f is the pore fluid pressure. As a first approximation, the model considers a vertical greatest principal compressive stress, sigma sub 1. It is apparent that if slip on low-angle normal faults is governed by the avove frictional failure criterion, slip on the low-angle normal fault occurs only if the least effective principal stress, sigma (*) sub 3 = sigma sub 3 - P sub f, is tensile, whenever tan superscrip -1(mu sub f> d, where d is the dip of the fault. If detachment faulting occurs at any significant depth in the crust, P sub f> sigma sub 3 is required. In light of this conclusion I allow P sub f to vary as necessary to allow slip on the low-angle normal fault. Author

LATE PRECAMBRIAN AULACOGENS OF THE NORTH CHINA CRATON
Xianglin Qian *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 115 - 117 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

According to tectonic styles, the Precambrian evolution history of the North China craton may be subdivided into four stages: (1) Archean consolidation in 3.5 to 2.5 Ga, (2) Early Proterozoic rifting in 2.5 to 1.8 Ga, (3) Late Precambrian aulacogen in 1.8 to 0.8 Ga and (4) Platform regime after 0.8 Ga. In the Late Precambrian aulacogen stage of the North China craton there were two main aulacogens, Yanliao and Zhongtiao (Y and Z), developed in Middle Proterozoic time with an age 1.8 to 1.0 Ga. Their NE trend caused them to meet together in the central part of the craton and build up one great Y-Z aulacogen throughout the craton. Author

RADIAL RIFT AND BLOCK TECTONICS AROUND THE THARSIS BULGE: INTRODUCTIONAL POSTULATION
J. Raitala *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extention on Continents and Planets 1985 p 118 - 122 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

Although the Vallis Marineris canyon and radial fossae grabens have been extensively studied, their origin and formation mechanism is still the subject of numerous questions. Possible rift formation is only one point of view and does not explain the rifting mechanism and the radial pattern of these structures around the Tharsis bulge. Both active and passive rifting must be taken into account. According to the active mechanism the building of a colcanic complex like the Tharsis bulge is caused by the rising of a huge mantle plume and adjoining extrusions which tap the generated magma. The surrounding fossae and valley structures are caused by more passive crustal rifting due to tensional failure of the surface layers. The main rising mantle plume activated and regenerated failure patterns radial to the centre of activity. These radial zones of weakness are then most easily utilized by the rising mantle plume. Deep zones of weakness regulate the penetration and distribution of hot mantle rock into upper levels while, contrarily, the effective impingement of the hot mantle plume into the lithosphere opens up new weakness zones. HEAT FLOW AND THERMAL PROCESSES IN THE JORNADA DELMUERTO, NEW MEXICO
Marshall Reiter *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 123 - 127 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

Most heat flow data in rifts are uncertain largely because of hydrologic disturbances in regions of extensive fracturing. Estimates of heat flow in deep petroleum tests within a large basin of the Rio Grande rift, which has suffered little syn-rift fracturing, may begin to provide clearer insight into the relationships between high heat flow and crustal thinning processes. The Jornada del Muerto is a large basin located in the Rio Grande rift of south central New Mexico. The region of interest within the Jornada del Muerto is centered about 30 km east of the town of Truth or Consequences, and is approximately 60 km north-south by 30 km east-west. High heat flows are estimated for the region. Values increase from about 90 mWm(-2) in the northern part of the study area to about 125 mWm(-2) in the southern part. These high heat flows are rather enigmatic because in the immediate vicinities of the sites there is little evidence of Cenozoic volcanism or syn-rift extensional tectonics. It is suggested that the geothermal anomaly in the southern Jornada del Muerto (approx. 125 to approx. 95 mWm(-2)

results from some type of mass movement-heat transfer mechanism operating in the crust just below the elastic layer. This conclusion is consistent with the geologic and geophysical data which describe a thin crust, apparently devoid of features indicative of extensional-tectonics in the upper part of the lastic crust.

CENOZOIC EXTENSION AND MAGMATISM IN ARIZONA

S. J. Reynolds and J. E. Spencer *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 128 - 132 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

The Basin and Range Province of Arizona was the site of two episodes of Cenozoic extension that can be distinguished on the basis of timing, direction and style of extension, and associated magmatism. The first episode of extension occurred during Oligocene to mid-Miocene time and resulted in the formation of low-angle detachment faults, ductile shear zones (metamorphic core complexes), and regional domains of tilted fault blocks. Evidence for extreme middle Tertiary crustal extension in a NE to SW to SW to ENE to WSW direction has been recognized in various parts of the Basin and Range of Arizona, especially in the Lake Mead area and along the belf of metamorphic core complexes that crosses southern Arizona from Parker to Tucson. New geologic mapping and scrutiny of published geologic maps indicates that significant middle Tertiary extension is more widely distributed than previously thought. The state can be subdivided into regional tilt-block domains in which middle Tertiary rocks dip consistently in one direction. The dip direction in any tilt-block domain is generally toward the breakaway of a low-angle detachment fault that underlies the tilt-block domain; we interpret this an indicating that normal faults in the upper plate of a detechment fault are generally synthetic, rather than antithetic, with respect to the detachment fault.

A NUMERICAL STUDY OF FORCED LITHOSPHERIC THINNING

G. Schubert, A. Anderson (Los Alamos National Lab., N. Mex.), and E. Fishbein *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 133 - 134 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

Subsolidus lithospheric thinning by mantle plumes may be involved in the creation of swells, hotspots, and rifts. Among the major questions concerning this process are the timescale on which it occurs and the structure of the plumes. The lithosphere is known to have been substantially thinned in 10 Ma or less. Current studies are focused on the lithospheric thinning by time-dependent plumes hypothesized to have large temperature differences across them.

KINEMATICS OF A LARGE-SCALE INTRAPLATE EXTENDING LITHOSPHERE: THE BASIN-RANGE

Robert B. Smith and Paul K. Eddington *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 135 - 137 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

Upper lithospheric structure of the Cordilleran Basin Range (B-R) is characterised by an E-W symmetry of velocity layering. The crust is 25 km thick on its eastern active margin, thickening to 30 km within the central portion and thinning to approx. 25 km on the west. Pn velocities of 7.8 to 7.9 km/s characterize the upper mantle low velocity cushion, 7.4 km/s to 7.5 km/s, occurs at a depth of approx. 25 km in the eastern B-R and underlies the area of active extension. An upper-crustal low-velocity zone in the eastern B-R shows a marked P-wave velocity inversion of 7% at depths of 7 to 10 km also in the area of greatest extension. The seismic velocity models for this region of intraplate extension suggest major differences from that of a normal, thermally underformed continental lithosphere. Interpretations of seismic reflection data demonstrate the presence of extensive low-angle reflections in the upper-crust of the eastern B-R at depths from near-surface to 7 to 10 km. These reflections have been interpreted to represent low-angle normal fault detachments or reactivated thrusts. Seismic profiles across steeply-dipping normal faults in unconsolidated sediments show reflections from both planar to downward flatening (listric) faults that in most cases do not penetrate the low-angle detachments. These faults are interpreted as late Cenozoic and cataclastic mylonitic zones of shear displacement.

RIFT SYSTEMS ON VENUS: AN ASSESSMENT OF MECHANICAL AND THERMAL MODELS c91

Sean C. Solomon and James W. Head (Brown Univ., Providence, R. I.) *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 138 - 141 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

The formation and distribution of major tectonic features on Venus are closely linked to the dominant mechanism of lithospheric heat loss. Among the most spectacular and extensive of the major tectonic features on Venus are the Chasmata, deep linear valleys generally interpreted to be the products of lithospheric extension and rifting. Systems of chasmata and related features can be traced along several tectonic zones up to 20,000 km in linear extent. Mechanical and thermal models for terrestrial continental-rifting are applied to the rift systems of Venus. The models are tested against known topographic and tectonic characteristics of Venus chasmata as well as independent information on the physical properties of the Venus crust and lithosphere.

POSSIBLE ROLE OF CRUSTAL FLEXURE IN THE INITIAL DETACHMENT OF EXTENSIONAL ALLOCHTHONS

Jon E. Spencer *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 142 - 144 (For primary document see N86-31119 22-46)

Avail: NTIS HC A08/MF A01 CSCL 08G

The existence of low-angle normal faults indicates that the ratio of shear stress (TAU) to normal stress (sigma sub N) needed to cause slip on faults is substantially less than would be predicted based on experimental data. Because the tensional strength of rock at a large scale is exceedingly low, the upper plate of a low-angle normal fault cannot be pulled down the fault ramp, but must be driven down it by its own weight. The active or recently active Sevier Desert detachment fault in western Utah dips regionally at 12 deg. The radio of shear stress to normal stress due to the weight of the upper plate on a 12 deg dipping fault surface is 0.2. In contrast, laboratory experiments indicate that slip on fracture surfaces occurs with almost all rock types when (tau/sigma) reaches values of 0.6 to 0.85, corresponding to normal-fault dips of 30 deg to 40 deg. Seismological data indicate that low deviatoric stresses are associated with movement on faults of other geometrics and are not unique to low-angle normal faults. It thus appears that approximately planar fault zones with surface areas of hundreds to thousands of square kilometers have different mechanical properties than would be predicted based on laboratory studies of fractured rock. Modeling of stresses indicates that deviatoric stresses greater than 5kb exist and are sustainable in oceanic lithosphere, and that failure occurs when tau/sigma sub N approaches 0.6 to 0.85.

The deformation by stretching of a continental type lithosphere has been formulated so that the problem can be solved by a continuum mechanical approach. The deformation, stress state, and temperature distribution are constrained to satisfy the physical laws of conservation of mass, energy, momentum, and an experimentally defined rheological response. The conservation of energy equation including a term of strain energy dissipation is given. The continental lithosphere is assumed to have the rheology of an isotropic, incompressible, nonlinear viscous, two layered solid. Author

GEOMETRY OF MIOCENE EXTENSIONAL DEFORMATION, LOWER COLORADO RIVER REGION, SOUTHEASTERN CALIFORNIA AND SOUTHWESTERN ARIZONA: EVIDENCE FOR THE PRESENCE OF A REGIONAL LOW-ANGLE NORMAL FAULT
R. M. Tosdal and D. R. Sherrod *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 147 - 151 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

The geometry of Miocene extensional deformation, which changes along a 120 km-long, northeast-trending transect from the southestern Chocolate Mountains, southeastern California, to the Trigo and southern Dome Rock Mountains, southwestern Arizona is discussed. Based upon regional differences in the structural response to extension and estimated extensional strain, the transet can be divided into three northwesterly-trending structural domains. From southwest to northeast, these domains are: (1) southestern Chocolate-southernmost Trigo Mountains; (2) central to northern Trigo Mountains; and (3) Trigo Peaks-southern Dome Rock Mountains. All structures formed during the deformation are brittle in style; fault rocks are composed of gouge, cohesive gouge, and local microbreccia. In each structural domain, exposed lithologic units are composed of Mesozoic crystalline rocks unconformably overlain by Oligocene to Early Miocene volcanic and minor interbedded sedimentary rocks. Breccia, conglomerate, and sandstone deposited synchronously with regional extension locally overlie the volcanic rocks. Extensional deformation largely postdated the main phase of volcanic activity, but rare rhyolitic tuff and flows interbedded with the syndeformational clastic rocks suggest that deformation began during the waning stages of valcanism. K-Ar isotopic ages indicate that deformation occurred in Miocene time, between about 22 and m.y. ago. Author

SIMILARITIES AND CONTRASTS IN TECTONIC AND VOLCANIC STYLE AND HISTORY ALONG THE COLORADO PLATEAUS-TO-BASIN AND RANGE TRANSITION ZONE IN WESTERN ARIZONA: GEOLOGIC FRAMEWORK FOR TERTIARY EXTENSIONAL TECTONICS
R. A. Young, E. H. McKee, J. H. Hartman, and A. M. Simmons *In* Lunar and Planetary Inst. Papers Presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets 1985 p 152 - 155 (For primary document see N86-31119 22-46)
Avail: NTIS HC A08/MF A01 CSCL 08G

The overall temporal and spatial relations between middle Tertiary volcanism and tectonism from the Basin and Range province onto the edge of the Colorado Plateaus province suggest that a single magnetic-tectonic episode affected the entire region more or less simultaneously during this period. The episode followed a post-Laramide (late Eocene through Oligocene) period of 25 million years of relative stability. Middle Tertiary volcanism did not migrate gradually eastward in a simple fashion onto the Colorado Plateau. In fact, late Oligocene volcanism appears to be more voluminous near the Aquarius Mountains than throughout the adjacent Basin and Range province westward to the Colorado River. Any model proposed to explain the cause of extension and detachment faulting in the eastern part of the Basin and Range province must consider that the onset of volcanism appears to have been approximately synchronous from the Colorado River region of the Basin and Range across the transition zone and onto the edge of the Colorado Plateaus. AN ATLAS OF OBJECTIVELY ANALYZED ATMOSPHERIC CROSS SECTIONS, 1973-1980
Jindra Goodman, Steven E. Gaines, and R. Stephen Hipskind Sep. 1985 197 p
(Contract NCC2-73)
(NASA-CR-176937; NAS 1.26:176937) Avail: NTIS HC A09/MF A01 CSCL 04A

Atmospheric variability over time scales greater than one month is conceptually simplified and readily recognized from vertical cross-sections of zonal-monthly mean data. The reduction to two dimensions, latitude and height, explicitly eliminates all zonal waves but implicity retains their effects on the thermal-pressure fields and the dynamically related zonal wind fields. This atlas contains 96 examples, spanning all latitudes in both the northern and southern hemispheres and two decades in pressure, from 1000 to 10 mb. Four analyses, representing each month from January 1973 through December 1980, depicts the potential virtual temperature, the observed zonal wind velocity, the virtual temperature and the geostrophic zonal wind velocity. Each variable is contoured at a close interval to facilitate visual estimates of stability and vorticity via their gradients. The analyses are generated and contoured by objective computer methods from just one data source: in situ measurements from the conventional rawinradiosonde system. Although the analyses are independently made at constant pressure levels (the mandatory levels) the cross-sections are drawn with geopotential height as the ordinate. With this ordinate one can observe the seasonal expansion and contraction of the earth's atmosphere, especially that of the polar stratosphere. Also, the quasi-biannual cycle can be identified and studied directly from successive cross-sections. M.G.

A STUDY OF ULTRAVIOLET EMISSIONS FROM THE OXIDES OF CARBON IN THE MESOSPHERE AND SHUTTLE ENVIRONMENT M.S. Thesis
Robert P. Tomic 1985 77 p
(AD-A166376; AFIT/CI/NR-86-4T) Avail: NTIS HC A05/MF A01 CSCL 04/1

This study seeks to determine if carbon oxide (CO, CO(+), CO2(+)) ultraviolet emissions in the mesosphere are observable, thus presenting an alternate method of determining the concentrations of these species. By developing photochemical models for CO(+) and CO2(+) it is shown that the concentration levels of CO(+) and CO2(+) are not adequate to produce UV band emissions bright enough to be detectable by spectrometric instruments. For CO, actual measurements of the concentrations were used in conjunction with g-factors to predict volume emission rates. These predictions indicate that only the CO fourth positive bands will be bright enough to measure by optical techniques. Mesospheric ultraviolet spectra obtained by the Imaging Spectrometeric Observatory (ISO) on the Spacelab 1 Mission are examined for the presence of the CO fourth positive bands and several bands are identified which are believed to be CO fourth positive. The CO fourth positive 1-6 band is used to calculate a density height profile for mesospheric CO. These calculations closely agree with measurements by others for mesospheric CO. This band system provides a viable method for measuring CO in the 80 km

to 110 km altitude region. A second study objective is to investigate whether carbon oxide emissions are found in the major products of shuttle engine exhaust and carbon materials are found to undergo significant mass loss on orbit. GRA

A STUDY OF ATMOSPHERIC REACTIONS OF NEUTRAL SODIUM SPECIES AND OTHER METALS OF METEORIC ORIGIN Final Report, 10 Nov. 1982 - 9 Feb. 1986
J. A. Silver and C. E. Kolb 10 Feb. 1986 112 p
(Contract F19628-83-C-0010)
(AD-A166561; ARI-RR-508; AFGL-TR-86-0010) Avail: NTIS HC A06/MF A01 CSCL 04/1

The reactions of metallic species introduced into the atmosphere by meteor ablation may play a significant role in the chemistry of the lower thermosphere and upper stratosphere. The work described in this report summarizes a series of experimental rate constant measurements for reactions pertinent to these atmospheric regions. Prior to this work, virtually no direct kinetic parameters had been measured for the reactions of alkalis, and in particular sodium, which are believed to occur between 30 and 100 km in altitude. Model predictions of excited sodium emissions, expected concentration levels of the various alkali species, and the potential impact of alkali chemistry on the ozone balance all depended on theoretical estimates of reaction rate constants and product branching rations. Using a high temperature fast flow reactor and a variety of atomic and molecular species source and detection techniques, we have measured rate constants for over a dozen reactions. GRA

DETAILED GRAVITY ANOMALIES AND SEA SURFACE HEIGHTS DERIVED FROM GEOS-3/SEASAT ALTIMETER DATA
Richard H. Rapp Aug. 1985 134 p
(Contract F19628-82-K-0022)
(AD-A166593; OSU/DGSS-365; AFGL-TR-85-0191; SR-9) Avail: NTIS HC A07/MF A01 CSCL 08/5

Gravity anomalies and sea surface heights have been computed on a 0.125 deg grid in the ocean areas from a combined Geos-3/Seasat altimeter data set. The basic procedure used least squares collocation estimation where model covariance models were tailored to individual areas through altimeter residual variance scaling. Preliminary tests led to production prediction procedures using a reference model defined by a set of potential coefficients complete to degree 180. Comparisons of the predicted anomalies with ship derived values showed agreements varying from + or - 9 to + or - 30 mgals. No corrections to the altimeter implied sea surface heights were made for sea surface topography effects. The maximum anomaly predicted was 396 mgals near Hawaii and the most negative anomaly was -361 mgals over the Puerto Rican Trench. The 0.125 data set has been used to display the results using color plots, contour maps, and perspective views. The gridded data was used to compute 1 deg x 1 deg and 0.5 x 0.5 deg mean values. 1 deg mean anomalies were compared to terrestrial data where a difference of f + or - 7 mgals was found in comparing 10139 values. Recent models of earth structure suggest large horizontal gradients, especially in shear velocities. Some changes in existing methods are required to construct synthetics for broadband signals in many situations, especially when energy can reach the receiver by up-going as well as down going paths. This can be accomplished by allowing locally dipping structure and making some modifications to generalized ray theory. Local ray parameters are expressed in terms of a global reference which allows a de Hoop contour to be constructed for each generalized ray with the usual application of the Cagniard de Hoop technique. Synthetics generated from this method are compared with finite-difference runs using an advanced stable free surface boundary condition where lateral velocity and density variations at the free surface are treated properly. The method is implicit, but only requires a simple pentadiagonal system solver to implement. When coupled with second- and fourth order interior solutions, the overall problems appears to be stable for shear to compressional wave velocity greater than 0.01 and 0.02, respectively. The method is compared with other published algorithms for accuracy and stability. GRA

INFRARED AIRGLOW CLUTTER Final Report, 15 Jul. 1983 - 30 Nov. 1985
J. Ulwick, K. Baker, and A. J. Steed Jan. 1986 46 p
(Contract F49620-83-C-0122)
(AD-A166994; AFOSR-86-0152TR) Avail: NTIS HC A03/MF A01 CSCL 04/1

A rocket and ground-based measurement programs was conducted to investigate infrared airglow and atomic oxygen density as part of the international MAP/WINE campaign in northern Scandinavia. The mean OH Meinel rotational temperature was approximately 199 K during a stratospheric warning event measured by a ground-based interferometer at ESRANGE in Sweden. This temperature is approximately 30 to 40 degress cooler than measurements taken when no stratospheric events were taking place and confirms the coupling theory that stratospheric warming results in mesospheric cooling. The atomic oxygen profiles measured by a rocket-borne resonance lamp technique showed a peak concentration of approximately 10 to the 11th power/cc between 90 and 100 km. The rocket results obtained between 90 and 180 km altitude show densities consistently almost an order of magnitude less than predicted by standard models. However, the rocket results are consistent with other measurements taken under similar conditions: winter nights with no particle precipitation. The 1.6 micrometer rocket-borne infrared radiometer also provided excellent altitude profiles of OH emissions. The STATE campaign examined some of the same phenomena with sounding rockets and in-situ probes launched from the Poker Flat Research Range, Alaska. GRA

THE ORIENTATION DISTRIBUTION OF NONSPHERICAL AEROSOL PARTICLES WITHIN A CLOUD Final Report
Isaiah Gallily Dec. 1985 37 p
(Contract DAJA45-83-C-0004; DA Proj. 1T1-61102-BH-57)
(AD-A167326) Avail: NTIS HC A03/MF A01 CSCL 04/1

The orientation distribution of non-spherical particles within a cloud was studied. Theoretically, the subject was treated for a general laminar flow of immediate as well as weak and strong character, and for a turbulent flow whose Kolmogoroff scale was much larger than the particles themselves. The laminar flow served as one realization for the turbulent field within the cloud. It is found that the orientation distribution function in a laminar medium is generally structured with a preferred orientation while that of the turbulent medium is random on the average but with a significant dispersion. Experimentally, a horizontal wind tunnel was erected for orientation measurements; it was equipped with a dedicated hot-wire computerized system for turbulence characterization, which was shown to conform to the determinations of Laufer. Light scattering signals were used as the orientation-gauge. GRA

EVALUATION OF THE TOTAL MAGNETOSPHERIC ENERGY OUTPUT PARAMETER, U/SUB T/
R. D. Zwickl, L. F. Bargatze, D. N. Baker, C. R. Clauer, and R. L. McPherron 1985 18 p Presented at the Chapman Conference on Magnetotail Physics, Laurel, Md., 28 Oct. 1985 Prepared in cooperation with Stanford Univ., Calif. and California Univ., Los

Angeles
(Contract W-7405-eng-36)
(DE86-006017; LA-UR-86-166; CONF-8510254-4) Avail: NTIS HC A02/MF A01

Over the last few years the relationship between U(sub T), the magnetospheric energy consumption or output rate, and epsilon, a commonly used solar wind-magnetosphere energy input function, has been explored in some detail. Very high correlations between U(sub T) and epsilon are found during periods of strong activity, and by using linear prediction filtering techniques a delta-function impulse response was found for filter elements representing essentially zero delay. In light of these remarkable results, the derivation of U(sub T) for these intervals is re-examined. We find that U(sub T) is dominated in each event interval by the term containing tau(sub R), the ring current decay time, and that when tau(sub R) is defined as a function of epsilon the delta-function impulse response is present. If a constant tau(sub R) is assumed, the delta-function part of the filter disappears completely. Thus, this delta-function, which has been taken as being indicative of the directly driven component is an artifact of the earlier analysis, and it is due to the dependence of U(sub T) on epsilon. Our results imply that until U(sub T) can be derived independently from epsilon, these two quantities cannot be compared in a meaningful way, and that results obtained in previous studies are not valid. TOPOGRAPHY, STRESSES, AND STABILITY AT YUCCA MOUNTAIN, NEVADA
H. S. Swolfs and W. Z. Savage 1985 11 p Presented at the 26th US Symposium on Rock Mechan ics, Rapid City, S.D., 26 Jun. 1985
(Contract DE-AI08-78ET-44802)
(DE86-008247; CONF-850671-21) Avail: NTIS HC A02/MF A01

Plane-strain solutions are used to analyze the influence of topography on the state of stress at Yucca Mountain, Nye County, Nevada. The results are in good agreement with the measured stress components obtained in drill holes by the hydraulic-fracturing technique, particularly those measured directly beneath the crest of the ridge, and indicate that these stresses are gravitationally induced. A separate analysis takes advantage of the fact that a well-developed set of vertical faults and fractures, subparallel to the ridge trend, imparts a vertical transverse isotropy to the rock and that, as a consequence of gravitational loading, unequal horizontal stresses are induced in directions perpendicular and parallel to the anisotropy. CHEMICAL INSTRUMENTATION FOR FIELD STUDIES OF ATMOSPHERIC WET DEPOSITION PROCESSES
R. L. Tanner Nov. 1985 8 p Presented at the 191st American Chemical Society National Meeting, New York, N.Y., 13 Apr. 1986
(Contract DE-AC02-76CH-00016)
(DE86-005255; BNL-37346; CONF-860425-10) Avail: NTIS HC A02/MF A01

Field studies of wet deposition processes require the differentiation and determination of many trace reactive species in the atmosphere. These species may be present in clear-air gaseous or aerosol phases, or they may be distributed between cloudwater or precipitation and interstitial gaseous phases. Analytical requirements on existing techniques have been extremely rigorous and, in several cases, have required development of new approaches to the sampling and determination of critical species. This paper reviews these developments with respect to airborne sampling in all general areas. DOE

BISTATIC PHASE SOUNDING IN THE IONOSPHERE ABOVE THE MINOR SCALE EXPLOSION
Joseph Fitzgerald Feb. 1986 27 p
(Contract W-7405-eng-36)
(DE86-008582; LA-10657-MS) Avail: NTIS HC A03/MF A01

A 4.8-kT chemical explosion named Minor Scale was detonated at the White Sands Missile Range on June 26, 1985. Following the detonation, three bistatic HF phase sounders observed disturbances in the ionosphere directly over the explosion. The path from transmitters to receivers, which were 283 km apart, had a midpoint 7 km northeast of ground zero. We describe the experiment and present time histories of the power spectra of the three transmission. Between 300 and 360 s after the explosion, all three links showed changes in spectra. The lowest frequency shifted by -1 Hz, indicating the passage of the acoustic wave from the explosion through the total reflection height in the E-layer at about 95 km. We model the Doppler shift and absorption change to be expected for this disturbance assuming the acoustic wave had an N-wave profile with a maximum amplitude of 15%. The spectra of the lowest frequency also show temporary peaks at negative Doppler that indicate partial reflection modes from upper and lower edges of the N-wave. We calculate the Doppler shift and reflection coefficients for these partial reflection modes. During the same time period, the spectra of the two higher frequency transmissions also showed temporary peaks at negative Doppler that rapidly changed their frequency offset. DOE

(DE86-008942; ANL/ER-85-1) Avail: NTIS HC A08/MF A01

The DeWitt field study, conducted July 10 to 21, 1979, provides information on the structure of the lower 2 km of the atmosphere and the surface boundary conditions for flat farmland in central Illinois. Mean wind and temperature profiles in the lower atmosphere were measured by in-situ soundings both with high-resolution miniature radiosondes and an instrument package carried aloft by a kytoon. The height and depth of the entrainment zone at the top of the boundary layer, and some wind velocity component means and turbulence statistics were measured with lidar and solar remote sensing systems. Standard meteorological surface observations, measurements of solar and net radiation, and eddy fluxes of momentum, heat, water vapor, and ozone over a local maize canopy complete the body of data collected. This report summarizes methods of observation and data reduction and presents the processed data in tabular and graphic forms in a series of appendices. These results can be used to test models of planetary boundary layer behavior, including the influences of surface fluxes and entrainment aloft on the variation of mixed layer heights and mixing processes in the boundary layer. DETERMINATION OF THE THERMOSPHERIC NEUTRAL WIND FROM INCOHERENT SCATTER RADAR MEASUREMENTS
I. Haeggstroem, J. Murdin, and D. Rees (University Coll., London (England).) Nov. 1984 27 p Original document contains color illustrations
(KGI-186; ISSN-0347-6405; ESA-86-97225) Avail: NTIS HC A03/MF A01

Measurements made by the EISCAT UHF incoherent scatter radar were used to derive thermospheric winds, which were compared to Fabry-Perot interferometer measurements of the neutral wind made simultaneously. Lack of knowledge of the vertical component of the neutral wind (assumed to be zero) and the neutral gas temperature (MSIS model values assumed) produces large uncertainties in the radar neutral wind. A Fabry-Perot interferometer observing vertically upwards through the radar scattering volume would produce estimates of the vertical component of the neutral wind and neutral temperature, however, with uncertainty in the altitude of the measurements. SKY LUMINANCE AND DIRECT BEAM ILLUMINANCE
S. J. Treado, W. E. Remmert, and J. W. Bean Mar. 1986 51 p
(PB86-196755; NBSIR-85/3251) Avail: NTIS HC A04/MF A01 CSCL 13A

Measurement of sky illuminance, sky luminance, direct beam illuminance and direct beam irradiance are analyzed and discussed. The database consisted of an annual set of integrated hourly measurements made at the National Bureau of Standards, Gaithersburg, Maryland. The relationship between diffuse sky illuminance and luminance of selected portions of the sky dome is examined. Measured sky luminances are compared to luminance calculated using equations for three standard sky types - clear, partly cloudy and overcast. The results indicate that the luminance distribution of actual skies varies considerably from the standard skies. GRA

APPLICATION OF SOLAR MAX ACRIM DATA TO ANALYZE SOLAR-DRIVEN CLIMATIC VARIABILITY ON EARTH Final Report, 1 Feb. 1985 - 31 Jan. 1986
Martin I. Hoffert Sep. 1986 20 p
(Grant NAG5-503)
(NASA-CR-176855; NAS 1.26:176855; NYU/DAS-86-151) Avail: NTIS HC A02/MF A01 CSCL 04B

Terrestrial climatic effects associated with solar variability have been proposed for at least a century, but could not be assessed quantitatively owing to observational uncertainities in solar flux variations. Measurements from 1980 to 1984 by the Active Cavity Radiometer Irradiance Monitor (ACRIM), capable of resolving fluctuations above the sensible atmosphere less than 0.1% of the solar constant, permit direct albeit preliminary assessments of solar forcing effects on global temperatures during this period. The global temperature response to ACRIM-measured fluctuations was computed from 1980 to 1985 using the NYU transient climate model including thermal inertia effects of the world ocean; and compared the results with observations of recent temperature trends. Monthly mean ACRIM-driven global surface temperature fluctuations computed with the climate model are an order of magnitude smaller, of order 0.01 C. In constrast, global mean surface temperature observations indicate an approx. 0.1 C increase during this period. Solar variability is therefore likely to have been a minor factor in global climate change during this period compared with variations in atmospheric albedo, greenhouse gases and internal self-inducedoscillations. It was not possible to extend the applicability of the measured flux variations to longer periods since a possible correlation of luminosity with solar annual activity is not supported by statistical analysis. The continuous monitoring of solar flux by satellite-based instruments over timescales of 20 years or more comparable to timescales for thermal relaxation of the oceans and of the solar cycle itself is needed to resolve the question of long-term solar variation effects on climate. (AD-A166628; AFGL-TR-85-0252; AFGL-ERP-931) Avail: NTIS HC A03/MF A01 CSCL 04/2

A numerical mesoscale forecast model was selected for potential use by the Air Force in an operational mode, either in a nested configuration, or as a stand-alone model in a base-weather station. The model was developed at the National Oceanographic and Atmospheric Association's (NOAA) Environmental Research Laboratory (ERL), and many of its numerical and meteorological features are described in this report. Two versions are specified: the first under development at NOAA/ERL and another at AFGL (the NOAA/AFGL model). A baseline test of the latter model revealed several problems. The initialization scheme computed initial fields of mass and momentum that failed to mutually adjust after several hours of integration. Subsequent techniques designed to improve the initial conditions appeared to be a step in the right direction. The nonmeteorological gravity-inertia wave noise evident in most of the forecast fields appeared to result from poor treatment of the variables at the lateral boundaries. Author (GRA)

THE EFFECT OF SMOOTHING THE DOPPLER RADAR DERIVED WIND FIELD ON PERTURBATION PRESSURE RETRIEVAL M.S. Thesis
George Philip Rosser, Jr. May 1986 53 p
(AD-A166631; AFIT/CI/NR-86-31T) Avail: NTIS HC A04/MF A01 CSCL 04/2

Gridded u and v wind components derived from dual-Doppler radar data were utilized to study the behavior of the perturbation pressure field when different amounts of smoothing were applied to the wind field. Data-void areas in the wind field were filled by extrapolation. Three-point and nine-point smoothing operators were employed to smooth the wind field prior to retrieving the perturbation pressure field. Smoothing the wind field produced a nonlinear variation of the central pressure value in a meso-low with respect to the smoothing parameter. The central pressure value decreased as the smoothing parameter increased. Pressure centers less than 0.1 kPa (1 mb) in absolute magnitude tended to amplify and migrate slightly. False pressure centers created by the data-void filling technique were removed when a smoothing parameter greater than or equal to 0.4 was employed. Smoothing parameters greater than or equal to 0.5 created a false pressure center.Author (GRA)

METEOROLOGICAL TELECONNECTIONS BETWEEN THE SAHEL AND THE EASTERN UNITED STATES M.S. Thesis
Jeffrey Earl Malan Dec. 1985 69 p
(AD-A166632; AFIT/CI/NR-86-32T) Avail: NTIS HC A04/MF A01 CSCL 04/2

The existence of atmospheric teleconnections between the Sahel and the eastern United States is investigated on a seasonal time scale. Precipitation data for the Sahel and surface temperature data for the eastern United States from the years 1951 through 1977 in the months June through October are used. The statistical procedures applied are principal component analysis; Pearson's product-moment and Spearman's rank correlation, simple linear regression. Data of the 700 mb height data are used to produce composite charts of seasonal circulation and for conducting circulation analysis in an effort to associate climate signals with anomalous conditions of the general circulation. Two readily identifiable modes of large-scale spatial variability are found in the first and second principal components. The first indicates the existence of an inverse relationship between precipitation in the Sahel and surface temperature in the eastern United States. The second principal component indicates a direct relationship between these two regimes. Circulation analyses reveal patterns in the 700 mb height anomaly field which may be connected with the postulated inverse relationship. Author (GRA)

TYPHOON STRUCTURAL VARIABILITY Thesis
Candis L. Weatherford Oct. 1985 94 p
(Grant NSF ATM-84-19116)
(AD-A166772; AFIT/CR/NR-86-10T) Avail: NTIS HC A05/MF A01 CSCL 04/2

This paper describes the varying structure of the tropical cyclone wind profile in terms of its core intensity, outer strength, and size where core intensity is defined by the tropical cyclone's minimum central sea-level pressure. Outer strength is an average tangential wind speed from 60 to 150 b nu (111-278 km), and size measures the radial extent of 30-kt and 50-kt surface winds. Analysis was performed on 700 mb aircraft data from over 500 reconnaissance mission into 66 Tropical cyclones of the northwestern Pacific. All these cyclones were of typhoon intensity sometime during their lifecycle. This data set is uniquely suited to fill the dual needs of: 1) providing inner wind profile information out to 4 deg radius, thus allowing the cyclone's strength to be measured; and 2) being able to sample the entire life cycle of the tropical cyclone from depression through supertyphoon stages. The focus of this study is on the outer strength region. GRA

The capability to accurately model the natural and perturbed climate is important to the understanding of current-related issues. It is important that all the major physical processes and feedback mechanisms in climate models be evaluated as to their accuracy and limitations. Since the transfer of solar and longwave radiation represents the prime physical process that drives the circulation of the atmosphere and its temperature structure, an evaluation of the modeling of radiative processes is a critical element in the overall evaluation of the models. This paper discusses model comparison studies of infrared radiative transfer models that have

been conducted for the purpose of validating and improving these models. DOE

SOME ATMOSPHERIC DISPERSION, WIND AND TEMPERATURE STATISTICS FROM JERVIS BAY, AUSTRALIAN CAPITAL TERRITORY 1972 TO 1974
G. H. Clark Jul. 1985 23 p
(DE86-701370; AAEC/E-606) Avail: NTIS (US Sales Only) HC A02/MF A01

A meteorological study of winds, temperatures and Pasquill stability categories was conducted in the coastal conditions at Jervis Bay. Three Pasquill stability categorisation schemes were compared. These indicated a predominance of neutral to slightly unstable conditions. During the daytime, north bay breezes and north-east sea breezes were most common together with on-shore south-east winds. Off-shore south-west winds prevailed during winter and were observed most frequently at night. DOE

PARAMETERS DETERMINING MAXIMUM WIND VELOCITY IN A TROPICAL CYCLONE
A. M. Choudhury Sep. 1984 11 p Submitted for publication Sponsored by IAEA and UNESCO
(DE86-701371; IC-84/159) Avail: (US Sales Only) NTIS HC A02/MF A01

The spiral structure of a tropical cyclone was earlier explained by a tangential velocity distribution which varies inversely as the distance from the cyclone centre outside the circle of maximum wind speed. The case has been extended in the present paper by adding a radial velocity. It has been found that a suitable combination of radial and tangential velocities can account for the spiral structure of a cyclone. This enables parametrization of the cyclone. Finally a formula has been derived relating maximum velocity in a tropical cyclone with angular momentum, radius of maximum wind speed and the spiral angle. The shapes of the spirals have been computed for various spiral angles. DOE

PACIFIC NORTHWEST WIND REGIONAL ENERGY ASSESSMENT PROGRAM, VOLUME 1 Final Report
R. W. Baker, J. E. Wade, W. Frick, R. Wittrup, and J. Buckley Oct. 1985 163 p
(Contract DE-AC79-81BP-25593)
(DE86-007113; DOE/BP-25593/1-Vol-1; BPA-85-19-Vol-1) Avail: NTIS HC A08/MF A01

In 1980 BPA began a 5-year Wind Regional Energy Assessment Program (WIND REAP) to assess the wind resource potential throughout the BPA service area. Areas showing evidence of high wind potential were identified and instrumented with anemometers. The wind data indicate that there is a very diverse wind flow over the region as the wind strength varies considerably both on a daily and seasonal basis. Some areas indicate strong winter winds, while others recorded the strongest winds in the spring and/or summer. Wind data were analyzed for 300 sites, and it was found that there are 39 areas that have wind energy development potential. The intermittent but diverse energy resource is available during most seasons. However, there are a few major development obstacles such as transmission network strength and land-use constraints that may limit or prevent the implementation of some of this resource. DOE

SEVERE LOCAL STORM WARNING VERIFICATION PRELIMINARY PROCEDURES
Leo A. Grenier and John T. Halmstead Apr. 1986 18 p
(PB86-194362; NOAA-TM-NWS-NSSFC-12) Avail: NTIS HC A02/MF A01 CSCL 04B

Verification of severe local storm warnings issues by National Weather Service offices is performed at the National Severe Storms Forecast Center (NSSFC). Issued warnings and event reports are collected and processed prior to verification. As part of these preliminary procedures two products are routinely disseminated nationally via the AFOS network. A summary of severe local storm event reports received during the previous 24 hours (CCCSTADTS) is prepared daily. Once each week, a summary (CCCSTAXXX) is prepared for each WSFO. The summary lists events and warnings processed during the previous week for all stations within the management area of that WSFO. A thorough knowledge of preliminary verification procedures and routine use of these products, as presented in the report, can insure greater accuracy of data and aid the WSFO in the preparation of Storm Data and Unusual Weather Phenomena (Form F-8). INTRODUCTION TO THE CCM MODULAR PROCESSOR (VERSION PROCO1)
Michael A. Dias Jan. 1986 54 p
(Grant NSF ATM-82-17015)
(PB86-188679; NCAR/TN-262-IA) Avail: NTIS HC A04/MF A01 CSCL 04B

The technical note provides an introduction to the CCM Modular Processor, a post-processing software package for the analysis of data on history tapes (mass storage volumes) output by the NCAR Community Climate Model (CCM). The document is designed as a tutorial to teach new users how to access the processor and complete simple tasks, and as a quick reference guide for more experienced users. The introduction/tutorial is not a comprehensive description of the modular processor. GRA
